Geology and Mineralogy.—In South N. the 'bottom rock' lies exposed in wide tracts of Thelemarken, Hallingdal, Romsdal, and part of Bergen Stift, and next to this comes the great sparagmite formation, containing fossils, and interspersed with large masses of fragmentary rocks. Between Langesund Fjord and Mjösen are fine formations of Silurian, rich in fossils, above which is here and there sandstone, and last of all coarse conglomerate. In the North are remarkable systems of strata, chiefly known as yet by local names. These are the 'Gaisa System,' in the great mountain peaks ('Gaiser'), and the 'Raipas System,' in Finmark; and in Throndhjem, conglomerate, sandstone, 'Throndhjem schist,' and the more recent 'Gula' schists. In central N., round Jotunheimen, are argillaceous slates and the quartz group of the Alpine region. Mesozoic formations are represented by a deposit of Oxford clay, with Jura fossils, on the island of Andø. The minerals, the same though not so plentiful as those of Sweden, are silver, copper, nickel, iron, lead, and zinc.

Botany and Zoology.—The fauna and flora of N. display great richness and variety. The forest growth consists mainly of pine and fir, which most abound in the valleys of South N., where the extreme limit of the fir is 2200-3000 feet above the sea. In Throndhjem Stift it reaches 1600 to 2000 feet, but near the Alten Fjord it is not higher than 700 feet. Above the conifers extends a belt of birch (very narrow in the S.), and above this are found the dwarf-birch (*Betula nana*) and several species of willows. Between these and the snow-line are lichens. Yet the *Salix herbacea* or *polaris* is sometimes found up to the very edge of the *névés*, as also the snow ranunculus, Alpine heather, and other mountain plants. The Dovre is justly celebrated as containing within a narrow limit the greatest variety of Alpine flora. In the less elevated districts of N. grow the black and white alder, the aspen, mountain-ash, bird-cherry, ash, elm, lime, oak,

and beech trees. The oak is abundant in the S.E. The forests of N. (24,500 sq. miles) shelter the largest European carnivora, the lynx, bear, and wolf. About 150 bears and 120 lynxes are killed annually. The elk is found in the interior, and on wooded islands and promontories the red deer, especially on the island of Hitteren, opposite Throndhjem Fjord. The desolate fells are the home of the glutton and the reindeer, the lemming and the polar fox. Hares are found everywhere, even up to the snow-line. Capercailzie, black-cock, hazel-grouse, and other feathered game abound in the forests. Ptarmigan ('rype') are most plentiful in the birch woods. In the marshy parts of the fells are the breeding grounds of many kinds of fen-fowl, of which the lapwing (*Charadrius apricarius*) and dottrel plover (*Charadrius morinellus*) are most numerous. The double snipe and the teal are abundant in the willow zone, and in the mountain tarns are found the black-banded loon, the *Fuligula marila*, *Fuligula clangula*, and other divers. Every species of sea-fowl occurring in Northern Europe is found along the coasts. The eider-duck is carefully preserved for its eggs and feathers all the year round N. of the Throndhjem Fjord, and on the so-called *Fugle-bjerger* ('bird-mountains') the capture of the *Mormon fratercula* is the sole occupation of the inhabitants. See Barth, *Erfaringer paa Jagten paa det mindre Vildt i Norge* (1874). Of freshwater fish the Salmonidæ are the most important. In the deep lakes trout and red char are caught, and in the rivers, sea and mountain trout. After grayling and char, the perch, pike, bream, and eel, are most abundant. The Greenland shark is caught off the Finmark coast at 150-200 fathoms. But most important to N. are the great cod and herring fisheries (the former valued in 1871 at £640,000, the latter at £420,000), which are a main source of national wealth.

Agriculture, Industry, and Trade.—In 1870 there were 149,013 registered farms in N., and the total value of landed property was estimated at £33,000,000. Not more than 980 sq. miles of land are under the plough, while the pasturage is estimated at 3430 sq. miles. Oats, barley, and potatoes are the chief crops, but much butter and meat, and about 1,000,000 qrs. of corn are annually imported. The annual value of the farm produce is computed at £4,500,000. The other principal industries are mining, timber-dressing, shipbuilding, brewing, and the manufacture of machinery, cottons, ropes, glass, paper, tobacco, leather, and lucifer-matches. In 1875 the total imports of N. amounted to £9,951,356, and the total exports to £5,821,538. The trade is chiefly with Great Britain, Germany, Denmark, Russia, Sweden, and France. The imports from the United Kingdom in 1875 amounted to £2,681,782, and consisted chiefly of iron, coal, cottons, woollens, and provisions; while the exports to the United Kingdom were valued at £1,994,587, and consisted chiefly of timber, ice, fish, and material for paper. At the end of 1875, the shipping belonging to N. numbered 7814 vessels, of 1,394,363 tons, manned by 60,281 sailors. In proportion to population N. has the largest commercial navy in the world. In 1875, 11,662 vessels of 1,788,565 tons entered the ports of N.; cleared, 11,884 of 1,806,298. The total number of ships that entered at ports in the United Kingdom from N. in the year 1876 was 4176, of 874,544 tons (Norwegian, 3040, of 642,462 tons); cleared to N., at ports in the United Kingdom, 3353, of 827,215 tons (Norwegian, 2694, of 629,800 tons).

Finance.—The budget for the year ending June 30, 1877, showed a revenue and expenditure of £2,177,700. At the end of 1876 there was a debt of £2,683,755, contracted for the construction of public works. The metric system of weights and measures is to be introduced in 1878.

Communication.—There were 366 miles of railway open for traffic at the end of 1876, the gross receipts from which in 1875 were £210,778. In 1876, N. had 4438 miles of telegraph lines. A well-regulated system of boat and posting communication is maintained throughout the country.

Army and Navy.—According to the laws of 1866 and 1876, the military force is divided into troops of the line (comprising five brigades of infantry, one of cavalry, and five battalions of artillery), the Landværn, or militia, and the Landstorm, or final levy. On the peace footing, the army comprises 12,000 men, with 750 officers. The navy comprises (1878) 32 steamers with 160 guns, besides 86 gunboats, mounting 142 guns.

Race, Religion, and Education.—The Norwegians proper belong to the Scandinavian branch of the Teutonic family. Besides

these, there were in N., in 1865, 7637 Finns (called in N. 'Quains'); 15,601 settled, and 1577 nomadic Lapps (called in N. 'Finns'); and 3870 persons of mixed descent. Lutheranism is the form of religion established by the Constitution, and this must be professed by all regular public officials; but toleration is extended to persons of all creeds, Jesuits excepted. In 1865 there were in N. 1,696,651 Lutherans, 3662 persons of different Protestant sects, 331 Roman Catholics, 25 Jews, 1038 Mormons, and 49 persons whose religion was unknown. Education is compulsory for all children between the ages of seven and fourteen. Schoolmasters, paid partly by local rates, partly by State grants, are either permanently settled, or reside periodically in every parish. Secondary schools are in almost all the towns, and thirteen of the chief have *larde skoler*, or colleges, partly maintained by government grants. The University of Christiania has 400 students.

Constitution.—By the fundamental law of the state, passed November 4, 1814, N. is a 'free, indivisible, inalienable kingdom,' united to Sweden under one sovereign. The United Kingdoms in their foreign relations are to be regarded as one state, but in all else are independent sovereignties, with two distinct forms of government. The executive is vested in the sovereign, but legislation and the power to tax belongs to the Parliament or 'Storting.' This consists of 111 members, chosen indirectly by popular election, who appoint one-fourth of their number to constitute the Upper House ('Odelsting'), the rest forming the Lower House ('Lagthing'). A bill passed by the Lagthing and twice rejected by the Odelsting may become law if supported by two-thirds of the entire Storting; also the royal veto on bills is merely suspensive, not absolute.

History.—The early history of N. describes the country as divided among a great number of tribes, living at constant feud with one another. Those on the coast took early to the seafaring life, and gradually became famous abroad as 'Vikings' (*vic*, 'a bay'). In the latter part of the 9th c., Harald, subduing several of the neighbouring petty kings, formed a great kingdom in the S., and by the beginning of the 10th c. his son and successor, Harald Haarfager (q. v.), had conquered the whole country. Many discontented chieftains emigrated to become pirates, or found settlements in foreign lands, as Iceland, the Faröes, and the Orkney and Shetland Isles. (See NORTHMEN.) On Harald's death N. was divided among his sons, the eldest, Erik Blodöxe, being over-king. But the endeavours of the latter to set aside the existing privileges of the subject kings produced a reaction; these called to N. Harald's youngest son, Hakon the Good, who was being brought up at the English court, and gave him Erik's crown. Hakon fell (951) in battle against Erik's sons. His son, Hakon the Good, could only gain the power (960) by acknowledging the over-lordship of Harald Blue-Tooth, King of the Danes, but on the latter submitting to Otto I. of Germany N. became again free. Under Olaf Trygvesson and Olaf the Saint (q. v.) Christianity was introduced. Olaf fell (1030) in battle with Cnut the Great of Denmark, who now made his son Swegen regent of N. Swegen was expelled in 1035 by Magnus, a son of Olaf the Saint, and from this time till 1319 N. was in the hands of native chieftains. With Hakon VII. the male line died out and the crown fell to his grandson, Erik Eriksson of Sweden. His successor, Oluf Hakonson, whose mother, Margrete, was the only daughter of the Danish Valdemar III. Atterdag, inherited N. in 1380, and in 1397 Margrete (q. v.) joined the three kingdoms by the Union of Kalmar. Sweden broke loose in 1524, but N. remained under Danish rule till the Peace of Kiel, 14th January 1814, when it was given up to Sweden by Denmark. Delegates from the people, however, had (May 1814) chosen as king Christian VIII. (q. v.), the former regent, and not till the defeat of a Dano-Norwegian army and the Convention of Moss (14th August) did the crown pass to Karl XIII., who was proclaimed by the Storting, after having sworn to the constitution that had been adopted by Christian. The attempts of this king and his successor Karl XIV. Johan to extend the royal prerogative led to manifold parliamentary contests, which did not cease till Oscar I. (1844-59) and Karl XV. (1859-72) accepted the full constitutional programme. The latter was succeeded (18th September 1872) by his brother Oscar II. (q. v.).

Language, Literature, and Art.—The long connection with Denmark has led to the Danish tongue being inflexibly fixed as the book-language of N.: yet every *parish* has its peculiar words and idioms. The speech is most like Danish in the extreme south, *ø*, *g*,

and *d* being there distinctly sounded, whereas in the S.E., as in Sweden, there is a preference for *ø*, *z*, and *k*. In the S.W. the vocabulary is chiefly Old Norse, diphthongs predominating, and in the N. the final vowels are frequently dropped, as in English and Scotch.—The literature of N. is scarcely distinguishable from that of Denmark till 1814, but since that date it has vigorously asserted its independence. The University of Christiania, established in 1811, was opened in 1813. Of her first trio of writers, K. N. Schwach (1793-1860), H. A. Bjerregaard (1792-1842), and M. K. Hansen, the latter alone exerted any great influence. But ere long the great literary contest between Wergeland (q. v.), the champion of imaginative freedom and revolutionary force, and Welhaven (q. v.), of harmony, beauty, and social order, enlisted every gifted pen in N. for one or other, as pointing out the true goal of national culture. Alongside of these, Rudolf Keyser (1803-64) and P. A. Munch (1810-63) founded the 'modern school of Norwegian history.' Science and literature took firm root, and rich stores of folklore were opened up by Asbjørnsen, Moe, Faye, Landstad, and Bugge. The chief names of the new and more realistic era of Norwegian literature are Bjørnson (q. v.) and Ibsen (q. v.), with their imitators Jonas Lie (born 1833) and Magdalene Thoresen (born 1819), and after these Andreas Munch (born 1811), a lyrical and dramatic poet, Jørgen Moe (born 1813), P. A. Jensen (1812-67), Theodore Kjerulf (born 1825), Fru Collett, and Fru Colhan. Henrik Krohn, Christopher Janson, and O. A. Vinje (1818-71), with the philologist Ivar Aasen (born 1813), have striven to give special prominence to what is strictly national in thought and language.—The first two Norwegian artists of note after 1814 were the painter Dahl and sculptor Michelsen. More recently N. has produced a number of sculptors, Brynjulf Bergslien, Borch, Budal, Fladager (d. 1870), Hansen (d. 1858), Glosimodt, and Middelthun. Adolf Tidemand and Hans Gude are the greatest living Norwegian painters. The former resides at Düsseldorf, the latter is professor at Karlsruhe. In N. itself the work of Eckersberg (1822-70) is continued by Morten Muller and Knud Bergslien. See Professor Munch, *Det Norske Folks Historie* (Christiania, 8 vols. 1851-63); Nielsen, *Ein praktisches Handbuch für Reisende* (Hamburg, 1874); Christian Tönsberg, *Norway, an Illustrated Handbook for Travellers* (Christiania and London, 1875).

Norway Hadd'ock. See BERGYLT.

Norwich, a city of England, capital of Norfolk, and a county of itself, is situated on the Wensum, just above its junction with the Yare, 113½ miles N.E. of London by rail, and 20 W. of Yarmouth. Styled from its trees and gardens 'the city in an orchard,' N., next to Oxford and Chester, is the most picturesque of all the English towns. Its 58 churches have dwindled to 34, besides the cathedral, 2 Roman Catholic churches, a synagogue, and numerous dissenting chapels. The cathedral, Norman in plan, was founded in 1094 and completed in 1510. It is 415 feet long by 200 wide, and has a spire of 309 feet, a nave, and beautiful cloisters. Of the churches, the chief are St. Peter Mancroft (1430, restored 1864), St. Andrew's (restored 1867), St. Giles (with a tower of 120 feet), and St. Lawrence (1472). The Norman castle, built by Roger Bigod, on a hill in the heart of the city, is a massive quadrangular edifice, now used as the county jail. The shire hall stands in what was anciently the moat of the castle. Other buildings are the bishop's palace (1318), the 15th c. guildhall, St. Andrew's Hall (originally the church of the Black Friars, 1415), in which is held the triennial musical festival, the corn exchange (1861), museum (1858), Edward VI.'s Grammar School (1547), where Parker, Coke, and Nelson were educated, the theatre (1826), hospitals, &c. N. has been famed for its woollen manufactures since 1336, and *worsted* derives its name from a neighbouring village. At present (1877) silk and wool weaving employs some 3000 hands, and bootmaking 6000 more. There are also manufactures of crapes, sailcloth, paper, brushes, ropes, mustard, starch, blueing, &c., and iron foundries, farm implement works, breweries, tanneries, dyeworks, and malt-kilns. N. returns two members to Parliament. Pop. (1871) 80,386. N. is the modern representative of the British *Cæsar* *Gwent* and the Roman *Ventia*. Under Edward the Confessor it had 25 churches and 1320 free burgesses. The E. Anglian bishopric was transferred hither from Thetford in 1094. In 1122 it became a great Flemish settlement, and in the reign of Elizabeth the bombazine manufacture was introduced by 4000 Walloon refugees. N. was the scene of the rebellion of John the Dyer

(1381), and of Kett, the Wymondham tanner (1549). See Bayne's *N., its Political, Religious, and Municipal History* (Nor. 1877).

Norwich, a city of Connecticut, U.S., at the head of the Thames river, 52 miles S.S.W. of Worcester by rail, has 23 churches, 10 banks, 2 daily and 2 weekly newspapers, and manufactures of firearms, bar-iron, printing presses, and machinery. Its woollen, cotton, and paper mills, supplied with water-power by the Yantic, Shetucket, and Quinebaug, are among the largest in the Union. Pop. (1870) 16,653.

Norwich or Mammaliferous Crag. See CRAG.

Norwood, Upper, Lower, and South, form a favourite suburban district a few miles south of London, in the county of Surrey. Prettily situated in an undulating and finely-wooded country, it is covered with mansions and villas, and has a wealthy population. There are 7 churches, and a number of schools. The Crystal Palace Station on the L., C. and D. Railway is in Upper N.; St. Saviour's Almshouses and the South Metropolitan Cemetery at Lower N. The pop. of the five ecclesiastical divisions of All Saints, St. Paul's, St. Mark's, St. Luke's, and Christchurch amounted to 30,135 in 1871.

Nose and the Sense of Smell. The nostrils form the true respiratory or breathing apertures of the higher animals, and also subserve the sense of smell, this sense being exercised through respiration. In other words, odorous substances have to be sniffed or drawn into the nostrils before their odours can be appreciated. The nose is the prominent portion of the face, in which the nostrils open externally. In fishes the nostrils are closed or pocket-like sacs, and do not open backwards into the mouth—save in two cases, the *Lepidosteus* or Mud-fishes, and the *Alyxine* or Hag-fish. In the other vertebrate groups the nostrils open backwards into the mouth; their hinder openings being named the *posterior nares*. The nose may be prolonged to form a proboscis as in the pigs, tapirs, and elephants. In the latter case the organ subserves prehension, is provided with numerous and complicated muscles, and with a finger-like process at its tip. It becomes also subservient in the elephant for the conveyance of fluids to the mouth. In some animals (e.g., bats) the nostrils have peculiar leafy appendages attached to them; and in the mole a special bone or ossicle is developed in the snout. The nostril may open externally by a single aperture, as in the porpoise, and in this animal a complicated arrangement of sacs connected with the respiration of the animal is also found. The *nasal fossa* or nasal cavities in man are two cavities of irregular shape in the middle line of the head, and which lie between the roof of the mouth and the base of the skull. In front they open outwardly by the anterior nares or nostrils, and backwards into the mouth by the hinder nostrils. The nasal cavities are broadest below, and each opens into or communicates with four *sinuses* or cavities existing in the frontal region of the skull, and in the sphenoid, maxillary, and ethmoid bones. Each nasal fossa also opens into the *orbit* or eye-cavity of its side, into the cranium or skull-cavity, and usually communicates with its neighbour-fossa through an aperture in the *septum* or partition which separates them. Fourteen bones in all enter into the formation of the nasal cavities—all the bones of the face except the *malar bone* and *lower jaw* aiding in the formation of the cavity. Into the formation of the nose, not only bony, but muscular skin, cartilaginous, and other structures enter. By its root the organ is directly attached to the forehead, while the nostrils are separated by a partition or *columna*. Around the margin of the nostrils a number of *virrissa* or stiff hairs exist. The *cartilages* of the nose consist of five pieces, two upper and two lower lateral pieces, and the cartilaginous *septum* or partition. These cartilages are united to each other by a tough fibrous membrane, the *perichondrium*. The *muscles* of the nose number seven on each side. The *skin* covering the organ is soft and thin, and contains sebaceous follicles of large size. The *nerves* are derived from the facial, ophthalmic, infra-orbital, and infra-trochlear sources.

Lining the nostrils is formed the *pituitary or Schneiderian* membrane, a specialised form of Mucous Membrane (q. v.), which is very closely attached to the perichondrium, covered with epithelial cells, and having large and branched mucous glands. The sense of smell is subserved by the filaments of the *olfactory nerves*, which form the first pair of *cranial nerves*, or those issuing from the brain. The olfactory nerves are distributed in the

mucous membrane of the nostrils in minute branches. At the termination of these nerves, we find peculiar bodies known as *olfactory cells*—spindle-shaped cells with delicate processes. The essential conditions under which the sense of smell is exercised appear to consist (1), in the presence of a special (*olfactory*) nerve; (2), in the capability of having certain changes induced in the nerve through contact with odorous substances; and (3) in the *moist* condition of the Schneiderian or mucous membrane, since, when this structure is dry, the sense of smell is either impaired, or may be lost altogether. The odorous matters must apparently be dissolved in the secretion of the mucous membrane, before their particles can be brought in contact with the olfactory nerves. It follows from this that the causes of odour exist in the presence of exceedingly fine particles given off by odorous substances. Thus the sense of smell becomes analogous to the sense of touch from the fact that contact of the odorous substance with the olfactory nerves is necessary for the exercise of the sense. Regarding the extreme fineness of the particles given off from odorous bodies, it may be mentioned that a grain of musk will scent a room perceptibly for years, without sensibly diminishing in weight. Notwithstanding the apparent sameness of bulk, there can be no doubt that the musk has been giving off infinitesimal particles of its substance, these particles giving rise to the sensation of smell. The olfactory nerves present exceptions to the ordinary structure of nerves in that, like the *Sympathetic Nerves* (q. v.), they exhibit no white outer substance. Their branches are further distributed to the N. in dense flexures. The N. is supplied with *common sensibility* by branches of the first and second divisions of the fifth nerve. When sensations such as heat, pain, itching, &c., are felt in the nostrils, these are the means through which the sensations are appreciated. But being nerves of common sensation they are entirely unconnected with the exercise of smell. This sense appears further to be confined to the parts of the nostrils in which the olfactory nerves ramify. Nor does it appear that the frontal *sinuses* or spaces existing in the frontal bone, and which communicate with the nostrils, bear any part in the appreciation of the sensations of smell. When air impregnated with the vapour of camphor was injected into these sinuses through a fistulous opening, no odour was perceived by the patient.

It would appear that all animals do not appreciate odour in a similar degree, and some odours perceptible to certain groups of animals may be unperceived altogether, or may be perceived less perfectly by other groups. Thus in man there may occasionally exist the inability to appreciate odours of a certain kind, and carnivorous animals are able to detect the presence of other animals by smell more accurately than herbivorous animals can; while the latter are specially susceptible of the odours of plants. Man himself appears to be vastly inferior to many lower animals in respect of his sensitiveness to certain odours, but he has a greater uniform range of appreciation of odours than his lower neighbours. The sense of smell, like that of taste, touch, sight, and hearing, is susceptible of being specially cultivated; and one of the most interesting points in the history of this sense relates to the permanence of ideas which may be represented in connection with this sense. Thus a person may be able to entertain a vivid recollection of a particular odour, a fact which proves that the true seat of smell is in the brain. This conclusion is borne out in the converse fashion by the fact that persons who have been habitually conscious of a bad odour during life, have been found, on *post-mortem* examination, to have been suffering from brain-disease.

Diseases of the N.—D. of the N. are divided into those of the external parts—the skin and cellular tissue; and those of the interior—the bones, cartilages, and mucous membrane. The most common affection of the external parts is *Athre* (q. v.), an affection of the sebaceous follicles, which is sometimes followed by enormous hypertrophy, producing pendulous masses called *lipoma*. The N. is peculiarly liable to certain forms of ulceration, a *lupous* and rodent ulcers; and epithelioma or Cancer (q. v.) is not uncommon at the angle of the N. Foreign bodies in the nostrils sometimes attract inspissated mucus and purulent secretions, and thus form the nuclei of rhinoliths or N.-stones. *Epistaxis* (q. v.), or bleeding from the N., is a very common affection, both in youth and old age; and in young women is sometimes vicarious when the menstrual discharge is suppressed. It is liable to occur in fevers and scurvy. *Coryza*, or nasal

catarrh, is a troublesome complaint characterised by catarrhal discharge, and frequently the loss of the sense of smell; and, occasionally, the mucous membrane becomes chronically thickened, especially over the end of the inferior turbinated bone. *Ozæna*, or foetid discharge from the nostrils, is one of the commonest and most distressing of maladies. The odour is horrible, and those affected are usually young children. The causes are various, but hereditary syphilis and struma are the chief. The mucous membrane is inflamed, possibly ulcerated, and covered with crusts of inspissated discharge, and the syphilitic variety tends to spread to the bones and cartilages, causing external openings and frequently resulting in destruction of the N. The cure of syphilitic ozæna can only be effected by anti-syphilitic remedies, and by the application of mercurial vapours and lotions. In *strumous ozæna*, cod-liver oil with arsenic or iodide of iron should be given, and in this and the idiopathic form, the nasal douche should be employed. Nasal *Polyptus* is a very frequent, and sometimes a very formidable disease. *Gelatinous* or mucous *polypti*, by far the most common form, originate generally from the mucous membrane which covers one or other of the turbinated bones, chiefly the middle; and they rarely spring from the septum, or from the roof of the N. They are often multiple. The symptoms are a mixture of catarrh and obstruction. The patient cannot sleep unless the mouth be open; the voice is affected and acquires a nasal tone, and the obstruction as well as the catarrh increase in damp weather, when the tumour increases in bulk, and may be seen in the nostril. *Polypti* may be removed either with the wire snare or the forceps, the main point being to get at the root and remove them from their attachment. *Fibrous polypti* are much more formidable than gelatinous, and they spring generally from the roof of the nasal fossæ, or from the base of the skull behind the posterior nares. Occasionally, though rarely, the tumour may be twisted off from the nostril or from the pharynx; but in most instances a surgical operation through the tissues of the face is necessary. This may be effected from below, through the hard and soft palate; from above, through the N.; or from the front, through the upper jaw. *Malignant polyptus* or Cancer (q. v.) rapidly fungates out of the nostril, and is apt to infiltrate the skin of the face.

No'sing, in Architecture, the prominent edge of a moulding, especially the projecting moulding of the tread-board of a stair.

Nosology (Gr. *nosos*, 'disease,' and *logia*, a 'discourse'), as a department of the science of medicine embraces three objects of consideration, viz., (1) the definition of the genera and species of diseases; (2) the nomenclature of diseases; and (3) the arrangement or classification of diseases. Many systems of N. have at different times been adopted; but that of Dr. Farr, one of the most distinguished medical statisticians, is the one upon which the returns of the Registrar-General were based until 1869. Dr. Farr's system of N. is arranged in four primary classes, each of which includes various orders.

Class I.—Zymotic Diseases (Gr. *zymê*, 'a ferment'), diseases that are either epidemic, endemic, communicable, inoculable, capable of propagation from existing foci, or of generation; induced by a specific material, which may be named a *poison*, or by want of food, or by its bad quality. **Class II.—Constitutional or Cachectic Diseases** (Gr. *cachexia*, 'ill-health, bad habit of body'). Sporadic diseases affecting several organs in which new morbid products are often deposited or grow. These diseases are sometimes hereditary, and develop in the course of nutrition and processes of life; but they are not capable of direct propagation, communication, or inoculation. **Class III.—Diseases in the course of which lesions tend to be localised.** Monorganic (Gr. *monos*, 'alone,' and *organon*, 'organ'), sporadic diseases in which the functions of particular organs or systems are disturbed or obliterated, with or without inflammation; sometimes hereditary. **Class IV.—Developmental Diseases.** Metamorphic, special diseases, the incidental result of the formative, reproductive, and nutritive processes. A fifth Class may be specified: Lesions from violence tending to sudden death. These lesions are the evident and direct results of physical or chemical forces, acting either by the will of the sufferer, or of other persons, or accidentally.

In 1869, the committee appointed by the Royal College of Physicians of London issued a nomenclature of disease suitable to England, and to all countries where the English language is

used. For each name they supplied the corresponding Latin term, and also the equivalent term in French, German, and Italian. After much consideration the committee resolved 'that the proposed classification of diseases should be based upon anatomical considerations.' In subservience to this anatomical distribution, diseases may be grouped as being general or local. General diseases are such as affect the whole frame rather than any special part of it. Local diseases are such as affect any part of the body. The labours of the committee commenced in 1865 and terminated in 1869, their 'nomenclature' being subject to decennial revision.

Diseases might be classified according to their symptoms, their causes, their intimate nature, the tissues or the systems of the body that are affected; but medical science is not yet sufficiently advanced as to admit of a strictly scientific nosological system. The anatomical basis of arrangement, adopted by the committee, necessarily implies cross-divisions; but it is convenient for practical purposes, in our present state of knowledge. See *The Nomenclature of Diseases* by a joint committee of the Royal College of Physicians (Lond. 1869).

Nossi-Bé ('great island'), an island on the N.W. coast of Madagascar, in 13° 14' S. lat., 48° 15' E. long.; area 74 sq. miles. It is volcanic, and has a number of extinct craters. The soil is rich, and the staple products are rice, sugar, and maize. The island also produces valuable timber, and among other exports are beeswax and tortoise-shell. It has been a French possession since 1843, and is subject to the Governor of Mayotta (q. v.). The chief settlement, Helleville, has a fine harbour. Pop. of the island, about 15,000.

Nossi-Ibrahim or *Sainte Marie*, an island on the E. coast of Madagascar, situated in 17° S. lat., 49° 52' E. long. It measures 33 miles in length, by an average breadth of 2 miles, and is separated from Madagascar by a channel 5 miles in width. The climate is exceedingly humid, in spite of which the island, on account of its sandy soil, is arid and barren. It has been a French possession since 1750, and the chief settlement, St. Louis, is fortified. Pop. about 6000.

Nostal'gia is a form of *melancholia*, manifested by an inordinate desire to return to one's native country, and to which is added the apprehension that he may never be able to return. Army surgeons often witness cases of N. According to Baron Larrey, the mental faculties are the first to be affected. Ninety-seven soldiers in the French army fell a sacrifice to this disease between 1820-26. In such cases, general paralysis is common; but death is the result of a gradual exhaustion of the vital powers. The Dutch, the Swiss troops, the Highlanders, and the Irish, are the most liable to this form of insanity. N. is a common affection among slaves who have been abducted from their native country; and the disease is evidently referred to by Dr. Livingstone, in his 'Last Journal,' when he states that many of the slaves abducted from Manyema-land died from what he described as a new disease, 'Broken-heartedness.'

Nos'toc, a genus of green-spored *Alga*, consisting of gelatinous masses of various configuration. They occur either on moist ground, rocks, &c., or in fresh or brackish water. A common species in Britain (*N. commune*) suddenly making its appearance after rain, on gravel walks and pasture grounds, has given rise to various fancies—the name 'falling stars' denoting one of these. *N. edule*, which occurs abundantly in running streams in China, is dried and used as an ingredient for soups, and an allied *alga* (*Hormosiphon arcticus*), abounding in the Arctic regions, is also a wholesome food. It is said that N. may become the *host* of a parasitic fungus, and by it be transformed into a *Collema*, that is, into a Lichen (q. v.) of the existing classification.

Nostradamus, properly *Michel de Nostredame*, a physician and famous astrologer, was born at St. Remi, in Provence, December 14, 1503. He studied philosophy at Avignon, and physic at Montpellier, where he took his doctor's degree in 1529. He practised at Salon, his skill and assiduity in arresting the plague procuring him no little fame, but he soon gave up his legitimate profession for the rôle of astrologer and prophet. In 1550 he published an almanac containing weather and political predictions—the first of its kind; and five years later appeared his famous *Prophéties*, enigmatical quatrains, arranged into seven centuries, and in 1558 extended to ten. These

gained him the favour of powerful patrons, and Catherine de' Médicis in particular loaded him with honours. When her son Henri II. was killed in a tournament, search proved the event to be predicted in the 35th quatrain of the first century in N.'s book. This established his fame. During his later years he lived a life of luxurious quackery as physician to Charles IX., dying at Salon, July 2, 1566. Of his two or three other unimportant books, mention will be found in Barest's *Nostradamus* (Par. 1842), or in Adelung's *Histoire de la Folie Humaine*. The best edition of the *Prophéties* is that of Amsterdam (1668).

Nos'trils. See **Nose**.

Notables were a class of persons in France whom it was convenient for the kings to consider as popular representatives, and who in emergencies sat in place of the States-General. In 1558 Henry II. summoned such an Assembly in order to assist him in raising a loan. It was composed of some priests 'deputed for the generality,' a slight sprinkling of the nobility, the chief magistrates of the good towns, some lawyers, and the presidents of the Parliaments. It was a mere mockery of a representative institution. A greater freedom of debate was introduced into the Assembly called at Fontainebleau two years later by Catherine. In 1596 Henry of Navarre summoned one at Rouen consisting of ten ecclesiastics, eighteen nobles, and fifty civic magistrates, who divided the revenue of the state into two parts, one for the king and war, another for the public services. They were merely the nominees of royalty, and the same may be said of the Assembly which, at the dictation of Richelieu, met in 1625. The state of the finances were put before an Assembly of N. in 1787, and Calonne, for proposing the abolition of privileged exemption, was treated as a traitor. His suggestion was afterwards adopted, and the N. gave place to the popular demand for a convocation of the States-General. See Kitchin's *History of France*, vols. ii. iii.

Notary Public is a legal officer whose business it is to attest acts of legal import, so as to make them authentic in foreign countries. The chief business of a N. P. is in noting and protesting bills of exchange. Any unqualified person acting as N. P. incurs a penalty of £50; and any qualified notary conniving in the act of an unqualified person, will be struck off the roll, on application to the Court of Faculties. See 3 and 4 W. c. 70, and 6 and 7 V. c. 90.

Notation, in Mathematics, is the method for symbolising numbers, quantities, or operations. The various systems of numerical N., which have been or are now extant, are best considered under **NUMERALS**; here it will be sufficient to indicate briefly the history of the development of the notations which characterise different branches of mathematical science. In pure geometry there is strictly speaking no true N., unless the distinguishing of the intersections of lines by letters of the alphabet can be so regarded. Algebra, on the contrary, owes its existence to the invention of a convenient notation, which embraces not only the quantity symbols (*a*, *b*, *c*, &c.), but also the operation symbols (+, −, ×, ÷, √, &c.). These symbols were sufficient until, in the hands of Newton, Leibniz, and the Bernoullis, algebra developed into analysis. Newton devised his fluxional, and Leibniz his differential N. Both are identical in signification, but the latter, being much more convenient, has been universally adopted, and has, indeed, never been improved upon. In the higher analysis the importance of a simple but at the same time suggestive N. is more clearly evident; but the peculiar power which a good N. possesses is best shown in the mathematical discoveries of the last quarter of a century. These few years have seen developed two great branches of mathematics—the higher algebra of Cayley and Sylvester and the quaternions of Hamilton—which are remarkable for their wealth of new names and symbols. Upon these their potency as methods of analysis is greatly dependent. See **ALGEBRA**, **CALCULUS**, **GEOMETRY**, **QUATERNIONS**, &c.

Notation, Musical. Besides the ordinary system of M. N. (for which see article on **MUSIC**, and which is in most general use), a literal form of notation for use in vocal music, known as the tonic sol-fa system, said to have originated with the Misses Glover, two ladies of Norwich, has been introduced by Mr. James Curwen, in which the various notes are designated by the initial consonants of *do*, *re*, *mi*, *fa*, *sol*, *la*, *ti*, *do* (*d*, *r*, *m*,

&c.); an accent above the note (*d'*) representing its higher octave below the note (*d*), its lower octave.

Note, an expression often used as a synonym for a musical sound, as in speaking of a high or loud note for example. The term is also applied to a printed character designed to represent the duration of such a sound, while its position on the musical staff indicates its pitch. The seven forms of notes in ordinary use are the breve ||o||, semibreve o, minim ♩, crotchet ♪, quaver ♫, semiquaver ♪, demisemiquaver ♪ and semidemiquaver ♪; the breve, which is only used in church music, being the longest, and each of the others half the length of that preceding. See **MUSIC**.

Not Guilty. See **GUILTY**.

Nothosaurus, an extinct genus of *Reptilia*, belonging to the order *Sauropsitygia*, which also includes the *Plesiosaurs* and other well-known fossil genera. In N. the neck, like that of the *Plesiosaurs*, was long, and was composed of at least 20 vertebrae. The vertebrae of the back were 'amphicoelous' (i.e. hollow at each end), and were thus modelled on the type of those of the fish; a conformation indicating that the animal possessed a flexible spine, and was probably an active swimmer. The teeth were conical in shape, and numerous; and proceeded from distinct alveoli or sockets. The limbs were in the form of swimming-paddles. All the species of N. are found in the Triassic rocks, and are especially plentiful in the Muschelkalk.

Notice to Quit is the formal notice between Landlord and Tenant (q. v.) of an intention to end the tenancy on a day named.

No'to, a town of Sicily, 16 miles S.W. of Syracuse, near the sea-coast. It has beautiful palaces of the aristocracy, and the *Accademia dei Trasformati* has a library and a museum of antiquities. Pop. 14,362. The present town, which dates from 1703, is 5 miles from the site of the old N., which was strongly fortified by the Saracens, and long held out against the Normans, but was destroyed by an earthquake in 1693.

No'tochord or **Chor'da Dorsalis**, the cellular body which is developed in the dorsal or back region of every vertebrate animal in the earlier stages of its development. After the egg or ovum of the vertebrate has undergone the process of segmentation (see **DEVELOPMENT**) the blastoderm or germinal membrane is formed. This upper part of the egg next exhibits a groove or depression—the *primitive groove* of embryologists. The edges of this groove grow together, and convert it into a canal, within which the spinal cord and brain are produced. In the floor of or below this groove, the N. appears as a cellular rod, forming the basis round which the spine or vertebral column is developed. Thus, the N. is replaced in all vertebrates (save certain fishes) by the spine; but as it is invariably present in the early life of every vertebrate without exception, it forms one of the most distinctive characters of this, the highest group of animals. The N. persists throughout life in its early or embryonic state in such fishes as the Lancelet (q. v.), lampreys, &c., whilst some of the highest members of the fish-class (e. g., sharks, skates, ray, sturgeon, lepidosiren, &c.) have either a rudimentary spine or a N. as its representative. Kowalevsky, a Russian savant, has discovered in the tail of the 'sea-squirt' or *Ascidian* larva a rod-like cellular body, which is regarded by evolutionists as the representative of the vertebrate spine. The sea-squirt larva in this view is the progenitor of the vertebrates.

Notornis, a genus of New Zealand birds belonging to the family *Rallidae*, and of which only one species, *N. mantelli*, is known. It was first established by Owen from fossil remains, but in 1850 a specimen was captured alive on Resolution Island, near the S.W. extremity of the colony. The N. is about 2 feet high, with a dark purple neck and body, and the wings, which are too feeble for flight, are shot with green and gold. The legs and short strong beak are of a bright scarlet. The flesh is said to be very delicate. The bird is extremely rare, if not now extinct.

Nototherium, an extinct genus of Mammalia belonging to the order of *Marsupials* (q. v.). Of all marsupial fossils N. is

probably the most nearly related to the existing kangaroos. It was of smaller size than the well-known *Diprotodon*, of which the skull measures in some specimens 3 feet in length. The remains of *N.* occur in the recent deposits in Australian bone-caves.

Not Proven is a verdict in Scotch criminal procedure. It indicates that the jury think the evidence against the prisoner insufficient to prove him guilty, but too strong for the jury to declare him innocent. Whatever evidence may come to light after a verdict of *N. P.*, the accused cannot be again indicted for the crime of which he has been acquitted.

Nott, General Sir William, G.C.B., one of the heroes of the disastrous British expedition to Afghanistan of 1839-42, was born at Carmarthen in S. Wales in 1782, and joined the Bengal Infantry in 1800. During the winter of 1841, when the Cabul army was exterminated, he held the town of Candahar. In the following spring he joined the avenging army of Pollock at Cabul; and on his way captured for the second time and destroyed the citadel of Ghuzni, and carried away the famous gates of Somnauth. He received a pension of £1000, and was appointed President at Lucknow. He died in 1845.

Nottingham, the chief town of Nottinghamshire, England, on the Leen, near its junction with the Trent, is 125 miles N.N.W. of London by the Midland Railway. Standing at the base and on the slope of a rocky elevation, it has many handsome buildings, public walks, and recreation grounds. By an Act of Parliament passed in 1877 the boundaries of the town were extended, and now include the former populous suburbs of Lenton, Radford, Basford, Sneinton and Bulwell. Pop. (1877) of extended borough estimated at over 160,000. Area, 9960 acres; rateable value, £600,000. Besides a town and county hall, an exchange, and a church of St. Mary, *N.* has a Free Grammar School (rebuilt in 1868), a Free Library, a Natural History Museum, School of Art, an Arboretum, a new theatre, and a Gothic fountain erected as a memorial of Mr. J. Walter, of the *Times*, for a short time an M.P. for the town. The laying of the foundation-stone of a new college in September 1877 was marked by addresses on the value of University teaching by Mr. Gladstone and Lord Carnarvon. The old Trent bridge of seventeen arches has been superseded by an iron-girder bridge with stone piers. *N.* is the chief seat of the industries in lace and hosiery, and has large silk and cotton mills, iron-foundries, dyeing and bleaching works, shoe manufactories, breweries, collieries, iron-foundries, and tanneries. Here is produced nearly all the British machine-made lace. The material used in the lace industry yearly amounts to £1,725,000; the net returns to £5,130,000. In the hosiery trade there are used, besides a great number of hand-machines, some 400 power warp, 1000 wide power rotary frames, and 1200 circular 'round about' frames; and there are employed 15,000 men, and 22,000 women and girls. For making machines for the lace trade there are in *N.* about 180 shops and 130 large factories, employing over 12,000 men and boys. The markets for corn and cattle are among the largest held in the midland counties. Several fairs take place annually, the most important being the 'Goose Fair' in October. Celebrated annual races are run in March on a fine course to the N.E. of the town. *N.* publishes three daily newspapers, and returns two members to Parliament. A strong castle was built at *N.* by William the Conqueror, and the town was repeatedly taken and in part destroyed in the reign of Stephen, and during the war of the Barons. Charles I., resisting the demands of the Parliament, marched hither from York in 1642, and *N.* was besieged and taken by Colonel Hutchinson in the following year. The castle was fired by rioters, October 8, 1831, on the rejection of the Reform Bill by the House of Lords, and remained a ruin till 1877, when the property was leased to the corporation of *N.* for 500 years, and is now (1878) in process of restoration at a cost of £20,000, for the purposes of a fine arts museum. *N.* has been the scene of many political and trade riots, the principal of which were in 1811-12, 1814, 1831, and 1865.

Nottinghamshire, an inland county of England, bounded N. by Yorkshire, N.E. and E. by Lincolnshire, S. by Leicestershire, and W. by Derbyshire, has an area of 526,176 statute acres, and a pop. (1871) of 319,758. The surface is chiefly undulating, but the vales of Belvoir and Trent are quite flat, while a range of low hills gives the western part a somewhat rugged appearance. The western part of the county is formed

of magnesian limestone and Old Red Sandstone, overlying coal, which is worked at Eastwood, Bilborough, and Radford; the rest of *N.* is chiefly composed of marl, New Red Sandstone, lias, quartz, and gravel. The principal river is the Trent, which, flowing N.E. through *N.*, is navigable for vessels of 200 tons as far as Gainsborough, and for river vessels throughout the county. In 1875 there were 156,043 acres under corn crops, 53,339 under green crops, 58,276 under clover, sainfoin, and grasses in rotation, and 157,073 in permanent pasture; also 19,977 horses, 73,799 cattle, 274,613 sheep, and 27,973 pigs. The principal manufactures of *N.* are cotton and silk laces, hosiery, and various woollen textile fabrics. There are also extensive iron foundries in the county town. There are cotton mills at Nottingham, Buxton, Mansfield, Plensley, and Southwell. The manufacture of lace curtains has been largely developed during the last ten years. *N.* is traversed by the N. Midland, the Great Northern, and the Sheffield and Lincoln Railways. Four members of Parliament are returned by the county. *N.* was included by the Romans in the province called *Flavia Cesariensis*; and among the remains are those of a Roman villa at Winnyhill. It belonged afterwards successively to Northumbria and Mercia. William the Conqueror granted the district to his nephew, William Peverell. Sherwood Forest in the W. is the legendary haunt of Robin Hood (q. v.), and 6 miles S. of Mansfield is Newstead Abbey, once the property and residence of Lord Byron.

Noureddin Mahmoud, Malek-al-Adel, the most distinguished of the Moslem rulers of Syria, succeeded his famous father Zenghi as Emir of Aleppo in 1145. No sooner was his reign begun than he proceeded to grapple with the Christians under Joscelin de Courtenay, Count of Edessa. He inflicted a most disastrous defeat on the Christian soldiery under the walls of Edessa, stormed the city, and massacred many of the citizens. The fall of this place occasioned the Second Crusade. After its failure *N.* determined to expel all Christians from Palestine, and to centre the government of Syria and of the surrounding provinces in himself. Raymond, Prince of Antioch, was slain in 1149. Joscelin, Count of Edessa, was taken prisoner immediately after. The inhabitants of Damascus, threatened by Baldwin III., king of Jerusalem, surrendered in preference to the Emir of Aleppo. After a long and dubious war Egypt was wrested from the corrupt administration of Shawir, the vizier, and restored to the Abbasside Calif of Bagdad, and that potentate rewarded *N.* with the title of Sultan, investing him with the governorship of Egypt and Syria. The last years of *N.* were embittered by the intrigues of Salah-ed-Din, lieutenant of Egypt; and as he was about to set out from Damascus to crush the rebel, he was seized with quinsey, which ended fatally, 15th May 1174. *N.* is one of the best of the Moslem warriors and princes. Brave, chivalrous, tolerant, and cultivated, he favourably compares with the finest soldiers that Christendom then sent to the East.

Noun (Fr. *nom*, Lat. *nomen*), in grammar, is the term used to denote that class of words which may be the subject for object of a sentence. The customary definitions are unsatisfactory. For example, when it is said that a *N.* is 'the name of any person, place, or thing,' we have here an unsuccessful attempt to exhaust the subjects of human knowledge. 'Thing' is made to include whatever is not a 'person' or 'place.' Yet who would call 'freshness,' 'summer,' 'conscience,' *things*? The right method therefore of defining the *N.* is to consider its office or function in a sentence, not its meaning or application. The classification of nouns has been made in various ways, and with various degrees of precision. Probably the simplest general distribution is into nouns *substantive* or *concrete*, and nouns *abstract*. All nouns fall under one or other of these divisions. Thus 'house,' 'regiment,' 'gold,' 'soul,' 'Milton,' are substantive nouns, *i.e.*, they are names of substances; of things that really exist in themselves, or are believed to exist; while 'sweetness,' 'virtue,' 'courage,' are abstract nouns, *i.e.*, they are the names of qualities that do not exist apart from the substances in which they inhere. But if we look more closely into these various kinds of nouns, we notice important differences between them. They do not all name in the same way. Thus the word 'house' describes to a certain extent the thing which it names. It tells us what kind of thing is meant, and it connotes or carries with it the knowledge of the properties peculiar to this kind of structure. It is therefore a *significant*

name, or a name with a meaning. But the name 'Milton,' on the other hand, gives us no information concerning the person to whom it is applied. It denotes him, but it possesses no *connotative* property. It is therefore said to be *non-significant* or meaningless. All nouns are capable of this twofold distribution. They are either significant or not. Thus 'regiment,' 'gold,' 'soul,' 'sweetness,' 'virtue,' 'courage,' express a meaning as well as give a name. It is of course possible to use such a word as 'Milton' *connotatively*; e.g., 'Some mute inglorious Milton here may rest;' but in this case there is a departure from the ordinary usage; it is not a person called Milton that is here referred to; it is any one having a genius like Milton.

We have noticed the classification of nouns into *substantive* and *abstract*. When we proceed to examine the former, we observe subordinate differences among them. 'House,' and 'Milton' are both substantives, but while there are many 'houses' there is only one 'Milton.' The former is therefore said to be a *common* the latter a *proper* N. Again 'house' and 'regiment' are both common nouns, but while house denotes only one of a class, 'regiment' implies number, and is therefore defined as a N. substantive, common, *collective*. So also 'gold,' though a N. substantive, is neither common nor collective. It denotes neither one nor several, but *material* or *stuff*. Grammarians have not yet agreed on a definitive phrase for this class of nouns, but probably the German 'stuff-nouns' is as good as can be had. Nouns abstract are also capable of subdivision. Some are formed from adjectives, as 'sweetness' from sweet; some from verbs, as 'belief' from believe, 'death' from die. The verbal or participial N. is a form of the N. abstract. 'Dancing' no more exists apart from persons engaged in the act, than 'sweetness' exists apart from things that are sweet. See Professor Bain's *Companion to the Higher English Grammar* (Lond. 1874).

Novai'a Zemla'i'a (Russ. 'New Land'), an uninhabited archipelago in the Arctic Ocean, belonging to the Russian Government of Archangel. Separated from Vaigatz Island by the Kara Strait, N. Z. extends first N.W., then N.N.E., and finally E.N.E. from Black Cape (70° 30') to Cape Nassau or Great Ice Cape (77° 8' N. lat.), a length of 550 miles. Average breadth, 70 miles; area, 35,450 sq. miles, chiefly made up by two large islands separated by Matotchkin-Shar, a winding strait from 1 to 2½ miles wide. The coasts are much indented, especially in the W., and rise rapidly to the plateau of the interior, which, as far as yet explored, has here and there between the rocky tracts green patches supporting reindeer, which are hunted by Samoiëds from N. Russia. The highest mountains (3280 feet) are near the W. coast. The E. coast was little known till the Norwegian captain, Johannesson, sailed round N. Z. in 1870. The average temperature of South N. Z. is 35° F. in summer and 30° 2' F. in winter. Lemmings, polar foxes, wolves, and bears are met with in large numbers, the coasts abound with sea-birds, and the neighbouring seas with whales. Whale fishers occasionally winter in sheltered spots. N. Z., probably discovered by Hugh Willoughby in 1553, is known to us through Lütke's four expeditions from 1821 to 1824, Johannesson's circumnavigation, and Rosenthal's expedition in 1871. See J. Spörer, *N. Z. in Geographischer, Natur-historischer und Volkswirtschaftlicher Beziehung* (Gotha, 1867).

Nova'lis. See HARDENBERG.

Nova'ra, capital of the province of that name in Northern Italy, stands on a rising ground between the Agogna and the Terdopio, some 25 miles W. of Milan by rail. It is surrounded with walls and bastions, and contains the ruins of an old castle, a cathedral dating from the end of the 11th c., fourteen other churches, a beautiful theatre, a monument of Cavour by Dini, a colossal marble statue of Carlo Emanuele III., and a monument of Carlo Alberto, who abdicated at N. in 1849, in consequence of the defeat sustained by the Sardinian forces in the battle fought here with the Austrians under Radetzky on the 23d March of that year. Pop. (1874) 29,516.

No'va Sco'tia, a province of the Dominion of Canada, bounded N. by Northumberland Strait, which separates it from Prince Edward Island, E. and S. by the Atlantic, W. by the Bay of Fundy and New Brunswick, includes the peninsula of that name, the island of Cape Breton, lying to the N.W., and other small islands near the mainland. N. S. proper, extending 280 miles from N.E. to S.W., or, including Cape Breton Island,

350 miles, and from 50 to 120 miles wide, is connected with New Brunswick by Chignecto Isthmus, which at its western end is low, and only 13 miles broad. The area of the peninsula is 15,627 sq. miles, that of the whole province, 21,731. Pop. (1871) 387,800. The coast-line measures fully 1200 miles, and is everywhere indented with inlets from 3 to 15 miles long. The principal of these are Sheet Harbour, Margaret's Bay, Mahone Bay, containing more than 200 islands, St. Mary's Bay, Annapolis Basin, the Bay of St. George, and Chedabucto Bay. The surface is broken by ranges of low hills, which are often rocky and barren; the valleys, however, are very fertile, and lakes everywhere abound, about 3000 sq. miles of the country being in water. In summer the climate is cool and delightful; but in winter the atmosphere is very moist, and, owing to the influence of the Gulf Stream, the coasts are frequently wrapped in heavy fogs. The chief geological formations are New Red Sandstone and Carboniferous, resting on and interrupted by granite and metamorphic rocks. The coalfields of Cumberland, Pictou, and Cape Breton, interesting geologically, are neither so large nor so valuable as was formerly supposed. The coal is bituminous, that of Glace Bay being much prized as a gas coal. In 1875 coal to the value of £11,541 was exported from N. S. The mineral products also include oilshales, iron, gold, gypsum, and fine sandstone. The gold field covers one-third of the area of the province. Between 1861 and 1871 more than £800,000 worth of gold was mined. Extensive tracts of the country are covered with forest, the timber of which is largely exported to Great Britain. Immense quantities of fish are also cured and exported (in 1875 to the value of £762,788). Shipbuilding is carried on to a considerable extent; and the manufactures include fish and seal oils, lumber, leather, and castings. In 1874 the total tonnage of vessels which entered and cleared the ports of N. S. exclusive of home trade, was £1,840,377; the imports amounted to £2,336,694, and the exports to £1,595,114. There were (1875) 341 miles of railway, a large part of which is owned by the Dominion Government. Besides the Anglican and Roman Catholic, the principal Churches are the Kirk of Scotland, the Presbyterian Church of the Lower Provinces, the Methodist, Methodist Episcopal, African Methodist, Baptist, and Congregational Churches. Education is conducted on an effective public system. The Anglicans have a university, and the Roman Catholics, Methodists, and Baptists each a college. The present inhabitants of N. S. are descended partly from the old Acadians, or French colonists, partly from English, Scotch, and Irish immigrants, the two latter being chiefly found in the northern half of the province. In 1874 there were 1837 Indians.

N. S. was discovered in 1498 by Sebastian Cabot, and some years afterwards Cape Breton received its name from some French fishermen, natives of Bretagne, who arrived there. Up to the year 1784, N. S. included the province now called New Brunswick, and previously also part of the State of Maine, the whole territory being named Acadie. This was the term used in the original commission of the King of France, and it is found in public documents as early as 1604. The first attempt at colonisation was made by Baron de Clery, a Frenchman, in 1518, but the expedition proved a failure. No further effort was made till 1604, when the French effected a temporary settlement under M. De Monts, a Huguenot, only to be driven out by the Virginian colonists in 1610. The Virginians, however, did not remain long in Acadie, and in 1621 it was granted by James I. to Sir William Alexander, under the name of N. S. But the settlers sent out by him had to return, having found the French in possession of the whole district. In 1654 an expedition sent out by Cromwell, forced the French occupants to surrender, but the colony was ceded to France by the Treaty of Breda in 1667. After many vicissitudes of fortune it finally came into British possession in 1711. On the conclusion of the Treaty of Aix-la-Chapelle in 1748, disputes having arisen as to the boundaries of the French and British possessions in America, the advantage was perceived by the British Government of having N. S. properly colonised, and on the 21st June 1849 about 4000 disbanded soldiers and their families, attracted by the liberal grant of free land, with tools, arms, and provisions for a year, arrived at Chebucto Harbour, and founded the town of Halifax. During the war between England and France, about 7000 Acadians were expelled from N. S. on account of intrigues with the Indians against the British colonists. After peace was

restored in 1763, the colony made rapid progress. The island of Cape Breton was at this time annexed to N. S., and in 1765 that of St. John (Prince Edward Island) became a separate province. In 1784 New Brunswick was likewise formed into a province, and a separate government was given to Cape Breton, with Sydney as its chief town. In 1867 N. S. was incorporated in the Dominion of Canada, and is represented in the Canadian Parliament by 12 senators and 19 members of the Lower House.

Novatians were a sect which arose in the Church in the third c., founded by Novatian, a presbyter at Rome, who was actively supported by Novatus, a presbyter at Carthage, and who denied the power of the Church to grant absolution to and readmit to communion those who had abjured the faith in time of persecution. Novatian was elected by his party Bishop of Rome (251) in opposition to Cornelius, who had just been elected by the majority of the clergy; whereupon a council was immediately assembled at Rome (251), by which the N. were declared to be separated from the Church. The sect continued to exist for about two centuries. After the consecration of their bishop, the N. professed great sanctity and rigour of discipline, and took the name of Cathari (q. v.). Besides the Lapsed they now refused absolution to all who committed gross sins after baptism, and this was regulated by their ascetic notions; e.g., in Phrygia, where they joined the remnant of the Montanists (q. v.), a second marriage was reckoned such a sin.

Novell'o, Vincent, an organist and musical writer, was born in London of an Italian family, in 1781. He became organist to the Portuguese embassy, and published a *Selection of Sacred Music* (2 vols.), *Collection of Motets for the Offertory, &c.*, *Gregorian Hymns for the Evening Service* (in 12 books), *Biographical Sketch of Henry Purcell, &c.* He died at Nice, 9th August 1861. His life has been written by his eldest daughter, Mrs. Cowden Clarke.—Another daughter, **Clara Anastasia**, born in 1818, studied music at Paris, in Italy, and Germany, and for seven years from 1840 made triumphant concert tours in England, Germany, Russia, and Italy. In 1843 she appeared in Pacini's opera of Sappho at Drury Lane, and sang at the Birmingham Festival. After her marriage with Count Gigliucci in November of the same year, she withdrew into private life, but in 1850 reappeared to delight for ten years more the lovers of music in Italy, Germany, and England. In this country she was considered the queen of oratorio. She was the leading soprano at the first two Handel Festivals at the Crystal Palace in 1857 and 1859, and made her final appearance in London, November 26, 1860, at St. James's Hall.

Novell'oe, an institute of the Roman law, compiled under the direction of Justinian; the subsequent constitutions of that emperor, and of some of his successors, were called the *N.*

Novels (Fr. *nouvelles*, Lat. *novella*, dim. of *novus*, 'new'). The name novel is applied to a form of prose fiction which is now vaguely distinguished from the romance by its incidents being drawn from modern society, and the comparative exclusion of the ideal colour and marvellous element associated with the latter. The distinction, however, between these two varieties of prose fiction cannot always be sharply observed, as the one form of narrative frequently invades the other's peculiar province; and in tracing the history of N. it is necessary to review various phases of fiction that seem widely apart from what are now recognised under that term. A novel at first meant simply a new tale—a tale of new interest—while a romance was the name given to any prose or verse composition in the Romance languages. But many fictitious tales which we might now be led to class as romances are more properly designated N., as they mirror the manners of the times in which they were woven, while various modern tales known as Ns display occasionally an ideality entitling them to be classed as romances. With the exception of the *Cyropædia* of Xenophon (q. v.), the earliest prose fictions produced by the Greeks with which we are acquainted were the *Milesiaca* or *Tales of Milesus*, a collection of brief love stories, said to have been written at Milesus in Asia Minor by one Aristides, and which were translated into Latin by the historian Sisenna, but are now lost. It is probable that the Greek love for prose fiction was quickened, if not kindled, by their intercourse with the Persians and other Oriental nations, as prose tales began to be produced among them after the Asiatic conquests of Alexander the Great. An author named Clearchus, a disciple of Aristotle, won celebrity as a writer of prose tales, and some years afterwards

Antonius Diogenes produced a wild story 'Of the Incredible Things beyond Thule,' telling of the wanderings of two lovers in fabled northern regions, which is chiefly noteworthy for having supplied themes to Achilles Tatius and others. In the reign of Marcus Aurelius tales of magic were written by Lucian and Lucius Patrensis, and about the same time Iamblichus produced *Babylonica*, a story of the flight and final escape of two lovers from the emissaries of the King of Babylon. The first prose fiction of high merit composed by a Greek was the *Ethiopica* or *Theagenes and Charicleia* of Heliodorus (q. v.), Bishop of Tricca. This work, which far surpassed its predecessors, and at once gained popularity, is a fanciful tale of love, magic, and piracy, related in a flowery poetic style, and abounding in romantic incidents. The story is rife in improbabilities, and many of its incidents have a sameness which fatigues the reader, but there is a lingering charm in its picturesque descriptions, and the character of the heroine is naturally and gracefully delineated. The story marks a great advance in the art of fiction. It was at once imitated by other writers, among whom Achilles Tatius (see *ACHILLES*) is perhaps the foremost. His *Cleitophon and Leucippe* resembles the story of Heliodorus in the nature of its incidents, and is considered by some to be superior in its style. It is, however, weak in the presentation of character, and is stained by indecency. A new form of prose fiction owes its origin to Longus (q. v.), whose *Daphnis and Chloe* is the earliest example of the prose pastoral. It is a beautiful idyllic tale of the loves of Daphnis and Chloe, a shepherd and shepherdess of the island of Lesbos, and though at times slightly insipid and languid, is free from the affectation that so often disfigures pastoral tales. The descriptions of the Lesbian scenery are vivid, simple, and refreshingly natural, and the story is imbued with a genuine air of rusticity, notwithstanding its graceful and antithetic style. In the Latin language prose fictions were produced by Appuleius (q. v.) and Petronius (q. v.). The work of the latter, who probably belonged to the 1st c. A.D., is entitled *Petronii Arbitri Satyricon*, and consists of fragments of a kind of comic novel relating the adventures of one Encolpius and his rascally associates in the South of Italy. The work is vigorously written, but is steeped in the grossest indecency. The most interesting portion is the account of the banquet of Trimalchio, where the coarse gluttony of the wealthy Romans is exposed with much fantastic humour. The *Golden Ass* of Appuleius is a wild story of a man being transformed into an ass by a Thessalian sorceress, and finally regaining his human form by eating roses. The story reveals a state of appalling and almost incredible immorality, but bears occasionally the undoubted marks of genius. It contains various episodes, of which the finest is the lovely symbolic tale of Cupid and Psyche. After the fall of the Roman Empire, from the 6th to the 12th centuries, prose fiction was confined almost solely to Eastern Europe, where several stories to which the term N. might be applied were written in the Greek language. Of these, the most noteworthy is that entitled *The Lives of Barlaam and Josaphat*, a religious romance erroneously ascribed to Joannes Damascenus, recounting the adventures of an Indian prince named Josaphat, who, despite his father's opposition, is won over to Christianity by a holy man styled Barlaam, and ends his days as a hermit. The main purpose of the work is under the form of fiction to inculcate the creed of the Greek Church and the advantages of a monkish life. Up to the 12th c. almost the only forms in which the literature of fiction was cultivated in Western Europe were the countless lives of the saints, narratives of miracle-working, temptations by fiends, and perils among the heathen; these, however, were not set forth as fictions, but as genuine historic records. During this period, however, the world-famous stories of the *Thousand and One Nights* were cast into an Arabic form. (See *ARABIAN NIGHTS*.) When the vernacular speeches of Europe began to supersede Latin as the language of popular literature, prose fiction reappeared. The literary awakening of the 12th and 13th centuries was distinguished by an immense productivity in fiction, but the chivalric and even the comic stories which were so eagerly craved for were at first related in verse. The *Fabliaux* (q. v.), or brief facetious metrical stories, were the kind of fiction most apt to assume a prose form; and the earliest prose fictions of enduring merit composed in the vernacular languages of modern Europe, the stories of Boccaccio (q. v.), in many important respects recall these less finished types of story-telling. Boccaccio's *Decameron* is the true ancestor of the modern novel.

Its short, polished tales of love and intrigue, gathered together from many sources, but retold with classic beauty of style, supplied a type of prose fiction which Italian writers have made peculiarly their own. Boccaccio was imitated by Sacchetti, Ser Giovanni, Masuccio, Sabadino, Giraldo Cinthio, Straparola, Bandello, Malespini, and others; this peculiar school of Italian fiction being distinguished by ingenious plots, which were often sombre and tragic, often exceedingly licentious, and by great refinement of style. In the 16th c. a new form of prose narrative was introduced into Italy in the *Arcadia* of Sannazzaro. The earliest prose fictions in France were tales of chivalry drawn from the long epics of the Trouveres on the deeds of Charlemagne and his paladins. In the 15th c. a fresh direction was given to story writing in France by the appearance of the *Cent Nouvelles Nouvelles*, a collection of humorous, and often witty and interesting tales, many of which were derived from the *Fabliaux* of the Trouveres. The great work of François Rabelais (q. v.), though immeasurably transcending in merit all preceding French fiction, did not give rise to a new school of storytellers in France. In 1558 *Les Cent Nouvelles de la Reine de Navarre* were published. These stories, which have not yet lost their wide popularity, deal mostly with the comic mishaps of intriguing lovers, and mainly owe their origin to the *Fabliaux*, the Italian novels, and the *Cent Nouvelles Nouvelles*. They are supposed to be told by a party of ladies and gentlemen, who being detained by a flood at a monastery in the Pyrenees, resolve to beguile the time by relating stories in turn in a fair meadow beside the river Gave. Novellettes of gallantry continued to be highly popular in France until in 1610 the *Astrée* of D'Urfé (q. v.) supplanted the brief licentious novels by the pastoral romance.

Spain has been singularly rich in the number of her early writers of prose fiction. The Moorish wars afforded many themes for prose narratives as well as for songs and ballads, but the most famous of the chivalric romances produced in the Spanish Peninsula is the *Amadis de Gaul*—‘the Iliad of the prose romances of knight errantry’—written by Vasco Lobeyra, a Portuguese who flourished towards the close of the 14th c. *Amadis de Gaul* was followed by numerous romances similar in incident and style, the favourite heroes of these stories of knight-errantry being Amadis and Palmerin, and the most famous of these works being that entitled *Palmerin of England*, the first edition of which, issued at Lyons in 1553, dedicated to the celebrated Diana of Poitiers, is said to have been translated from the Castilian. The names of many romances of the same type as *Amadis de Gaul* are mentioned in the well-known account of the destruction of Don Quixote's library. But in the 16th c. these prose fictions were superseded by the pastoral romances, a form of narrative supposed to be of Portuguese origin, transferred into Spanish literature by Montemayor (q. v.), a writer of Portuguese birth, whose *Diana* at once gained vast popularity, and was imitated by a shoal of authors. A third variety of Spanish fiction is what is termed the Picaresque novel, which recounts the rogueries of clever vagabonds, and to which the short stories of George Peele supply a close resemblance, though the best examples of the class in English literature are Defoe's *Colonel Jack* and *Captain Singleton*. The first specimen of the picaresque novel is the *Life of Lazarillo de Tormes* by Diego Mendoza, a politician of the reign of the Emperor Karl V.; and the most successful imitation of Mendoza's story is the *Don Gusman de Alfarache*, published in 1599. Shortly after the appearance of the last-named work, the crowning masterpiece of Spanish literature, *Don Quixote*, was published, the first part being published in 1605 and the last in 1615 (see CERVANTES). During the 17th c. heroic romances were popular throughout Western Europe. These fictions, which owed their origin to the *Astrée* of D'Urfé, were interminable narratives in which the leading characters of Greek and Roman history figured as knight-errants going through fabulous adventures, and delivering prolix high-flown speeches, the works being permeated with anachronisms, and abounding in diffuse and stilted descriptions of scenery. The best known of these fictions were the *Polexandre* of Gomberville (q. v.), the *Cleopatra* and *Cassandra* of Calprenède (q. v.), and the *Artamenes* and *Clelie* of Madeine Scudéri (q. v.).

For several centuries after the Norman Conquest the imaginative literature produced in England consisted chiefly of metrical tales of chivalry, cast at first in French, and afterwards in English verse. In 1485 the *Mort d'Arthur* was published by Caxton, a

work which is the most notable example of early prose fiction in England. It was written by Sir Thomas Malory (q. v.), and consisted of a collection of Arthurian romances (see ARTHUR and ARTHURIAN ROMANCE), which various *trouvères* had amplified and linked together after Geoffrey of Monmouth (q. v.) made the tales of Arthur and Merlin known to Western Europe. The *Mort d'Arthur* is written in a quaint poetic style, and abounds in passages of deep feeling and strange allegoric significance, while the knights whose deeds it recounts are endowed with a kind of vague epical grandeur. The book was a popular favourite during the Tudor times, and after sinking almost into oblivion, has of late years re-attracted attention as the source of the themes of Tennyson's *Idylls of the King*. About the same time that Malory's book was issued, Caxton translated and printed stories of the siege of Troy, and of various ancient heroes; and during the reign of Henry VIII. Lord Berners produced English versions of the French stories *Artus de la Bretagne* and *Huon of Bordeaux*. During the 16th c. an impetus was given to the development of English prose fiction by the translations of foreign romances, while at the same time short and often facetious stories of English life became generally popular. Among these tales of purely English origin may be mentioned the *History of Thomas of Reading, or the Six Worthly Yeomen of the West*, which gives pictures of social life in England in the time of Henry I.; a version of the old favourite tale of *Robin Hood*; *George-a-Green, the Pinner of Wakefield*; *The Pleasant History of Tom-a-Lincoln, the Red Rose Knight*, which recounts how an English adventurer won the hand of the daughter of Prester John, ‘the monarch of the world’; the *History of Helyas, Knight of the Sun*; the *Life and Death of Dr. John Faustus*; the *Life of Virgilius*, an adaptation of the mediæval legends in which the poet Virgil figures as a necromancer; and the story of *Robert the Devil*, which tells how a prince, after rioting in sin through Satanic agency, is saved by a miracle from eternal perdition, and after doing penance by living among dogs, is married to an emperor's daughter. During the latter half of the 16th c. and the first half of the 17th c. various foreign and ancient tales of standing reputation were first made known to the English people by translations, and contributed greatly to mould the several forms which English fiction afterwards assumed. Among the earliest and most notable of the works thus rendered into English were part of Boccaccio's *Decameron* (1566), the *Golden Ass* of Apuleius (1571), the *Æthiopica* of Heliodorus (1587), Mendoza's *Lazarillo de Tormes* (1586), and Montemayor's *Diana* (1598). The first English version of *Don Quixote* was issued in 1620, and Urquhart published his felicitous rendering of Rabelais in 1653. Thus the types of fiction which may be styled the novel of gallantry, the pastoral romance, and the picaresque novel were introduced into England at the beginning of the 17th c. In the reign of Elizabeth, the voluminous Spanish romances relating the deeds of Amadis de Gaul and Palmerin were also ‘done into English,’ and several English imitations of the long chivalrous tales were produced, of which the most popular was perhaps Emanuel Ford's *Famous Historie of the Renowned Parismus, Prince of Bohemia*, published in 1598, and modelled to a great extent after the Spanish work *Palmerin d'Olive*. But the fantastic and long-winded tales of chivalry could not satisfy the Elizabethan age, with its keen interest in human character, its frank enjoyment of humour, its positive practical tendency, its vigorous curiosity in regard to the incidents of actual life; and accordingly the old romances gave place to translations and imitations of Italian love-intrigues, such as Paynter's *Palace of Pleasure* and Grimstone's *Admirable Histories*. A form of fiction which seems to have been borrowed from no foreign work was introduced into English literature in 1516, when Sir Thomas More (q. v.) published his *Utopia*, a political allegory, in which the author's opinions in regard to the constitution of a state, marriage, education, &c., are set forth in the conversation of an imaginary scaman named Raphael Hythlodæ. Other examples of the prose political allegory are Bacon's *Atlantis*, Bishop Hall's *Mundus Alter et Idem*, and the *Argenis* of John Barclay. John Lyly's story entitled *Euphues*, and its sequel *Euphues and his England*, are mainly remarkable for having affected Elizabethan writers with a fondness for antithetic constructions and startling conceits. (See LYLIV and EUPHUISM.) *Euphues* relates how a witty Athenian, travelled to Naples and fell in love with a fair Neapolitan, with whom he engaged in long affected discussions, but who finally abandoned him for

his friend Philantus. In the sequel *Euphues* and Philantus visit England, and though the narrative is of slight interest as a fiction, it affords us much valuable insight into the social life of the 16th c. Among Lyly's imitators were Lodge, author of *Rosalind, or Euphues' Golden Legacy*, which supplied Shakespeare with the plot of *As You Like It*, and the dramatist Robert Greene (q. v.), whose prose tales show facility and grace of diction, and considerable skill in the management of the plot. Among the finest of his stories are *The Historie of Dorastus and Fawnia*, on which Shakespeare founded his *Winter's Tale*, and *Philomela*, a work of singular beauty of style and moral purity. In 1593 Sir Philip Sidney's prose-romance *Arcadia* was published. This is the most important contribution made to English prose fiction by any Elizabethan author. It is a pastoral and heroic romance, kings and queens and knights as well as shepherds and shepherdesses being among its chief characters. The scene of the story is laid in *Arcadia* and in other parts of the Peloponnesus. The style is elaborately quaint, flowery, and musical, and the characters are represented as endowed with ideal virtues. The moral reflections and minute descriptions of scenery are apt soon to become fatiguing, but the reader is repaid by the genuine tenderness of many passages and the heroic enthusiasm of others. (See SIDNEY.) The popularity of Sidney's *Arcadia* endured to the 18th c., and encouraged a taste for long romances resembling those of D'Urfé and Scudéri, of which the most noteworthy is the *Parthenissa* of Roger Boyle, Earl of Orrery.

None of the works above mentioned have retained their popularity to modern times, but in 1672, Bunyan (q. v.) published the *Pilgrim's Progress*, which went through ten editions before 1685, and was followed by the less successful allegoric tale of the *Holy War*. Several brief novels were written by Mrs. Aphra Behn, and were widely read in polite society at the close of the 17th c. Up to this time no prose fiction had been produced in Britain dealing at any length with the incidents of contemporary life, but in the early part of the 18th c., when English prose literature began to assume unwonted importance, a new development was given to fiction by Swift (q. v.) and Defoe (q. v.). The former gave a new direction to prose fiction, rendering it comic, homely, and outspoken, and stripping it of the flowery phrases and high-flown sentiments which marked alike the novels of gallantry and the *Arcadian*, or pastoral-heroic romances. Daniel Defoe (q. v.), without Swift's gift of humour, excelled him in the art of giving verisimilitude to fictions, and produced a series of imaginary stories, any of which is almost indistinguishable from a veritable narrative. Defoe may be regarded as the writer who divorced British prose fiction from allegory and fanciful invention, and wedded it for a time to realism. Steele and Addison deserve to be numbered among writers of prose fictions, on account of several of the slight but exquisite sketches which they contributed to the *Spectator*. The *Memoirs of Martinus Scriblerus*, by Arbuthnot, Pope, and others, is a satire conveyed under a transparent veil of fiction, and Arbuthnot's *History of John Bull* is an allegorical and political satire. In 1740 appeared *Pamela, or Virtue Rewarded*, the earliest of the once popular N. of Richardson (q. v.). Richardson's N. are cast in the form of letters, the characters are artificial, and the story is in every case drearily spun out, but for pathos and minute accurate delineation of certain states of feeling, he has scarcely been excelled. His style of fiction was original, for, unlike Defoe and Swift, he had no foreign precedents for his tales. A more lasting popularity than Richardson's was gained by his contemporary Fielding (q. v.), whose great novel *Tom Jones* stands in many respects unsurpassed in British prose fiction, and combines the interest of a tale of adventure, of humorous pictures of everyday life, and of vivid delineation of character. The novels of Fielding and Smollett (q. v.), with their abundance of farcical incident, their variety of scenes, many of them laid in country inns, show the influence of *Don Quixote* and of Le Sage's *Gil Blas*, a French imitation of the Spanish picaresque novel. Charming prose tales were written by Sterne (q. v.) and Goldsmith (q. v.). The revival of naturalism in literature first began to show itself in the second half of the 18th c. It is distinctly traceable even earlier in the poetry of Thomson, Collins, and Gray. In prose, however, it is from the first merged in a picturesque medievalism. Percy's *Reliques* and Warton's *History of English Poetry* show the general direction of the current; but Walpole's *Castle of Otranto* (1769) is the earliest example of what may be called the *Gothic* romance. It was imitated in

the wild stories of banditti, haunted castles, and fantastic melodramatic characters written by Mrs. Radcliffe (q. v.) and M. G. Lewis (q. v.), and it survived until the appearance of the *Waverley N.* Meanwhile the influence of the French Revolution began to show itself in Godwin (q. v.), who wrote powerful stories to expose the wrongs of the present state of society; while Mrs. Inchbald (q. v.), Mrs. Opie (q. v.), Miss C. Smith, Miss Austen, and Miss Edgeworth (q. v.) foreshadow the future crowd of female novelists. Miss Austen and Miss Edgeworth finely illustrate the power of keen and critical observation possessed by their sex. Scott (q. v.) founded the modern historical novel, which, unlike the 17th c. heroic romances, endeavours to revive the manners of the past, and deals especially with medieval times. Since Scott's death N. have been produced in unprecedented numbers and variety, until they now hold the position in modern literature which the drama occupied in the Elizabethan period. From about 1830 to about 1835 N. of English life were written by Disraeli (q. v.), Bulwer-Lytton (q. v.), Douglas Jerrold (q. v.), Warren, Theodore Hook, Miss Martineau (q. v.), Charlotte Brontë (q. v.), and Ellen Brontë. Fashionable N., which aimed, generally without success, at representing aristocratic scenes and persons, were produced by Mrs. Trollope, Lady Blessington, Disraeli, Lytton, Mrs. Gore, Hook, &c.; military and naval N. by Marryat (q. v.), Hannay, Lever (q. v.), Cupples, &c.; historical N. by Lytton, James (q. v.), Ainsworth (q. v.), &c.; N. of Scottish life by Galt (q. v.), Hogg (q. v.), Cunningham (q. v.), Lockhart (q. v.), Wilson (q. v.), &c.; and Irish stories by Banim (q. v.), Lever, Lover, Griffin (q. v.), Carleton (q. v.), &c. The great masters of English prose fiction since Scott are Thackeray (q. v.)—probably the chief of all writers of N.—Dickens (q. v.), and 'George Eliot' (q. v.). Thackeray's excel all former English N. in combined beauty of literary workmanship, depth and keenness, wealth of thought, knowledge of character, and exquisite philosophic humour. Dickens founded a school of novelists that deal greatly in melodramatic incident and in comic pictures of London life. 'George Eliot' began her career by issuing tales of English rural scenes and provincial middle-class life, and has of late sought to make the novel deal with wider issues than are involved in the career of an individual. Among recent English novelists ranking more or less near to the three great authors mentioned above are Reade (q. v.), Collins (q. v.), Kingsley (q. v.), Mrs. Oliphant (q. v.), Macdonald (q. v.), Black (q. v.), Blackmore, McCarthy (q. v.), Yates, and Whyte-Melville. The 'sensational' school of fiction, cultivated chiefly by women, neither needs nor merits special notice.

During the 18th and 19th centuries the literature of fiction has flourished among the other cultivated nations of Europe no less than in England. In France the fairy tales of Perrault (q. v.), Comtesse d'Aunoy (q. v.), Madame Villeneuve (q. v.), charmed and solaced for a couple of generations the jaded fancy of a society at once luxurious and superstitious. In the N. of Mariwauz (q. v.), the Abbe Prevot (q. v.), and Crebillon (q. v.) we see a foreshadowing of the wild and impure licence that marks the latest developments of French fiction. Le Sage (q. v.), in his *Gil Blas*, *Diable Boiteux*, and *Le Bachelier de Salamanque*, reproduces the inexhaustible fertility of the Spanish picaresque romance; Rousseau (q. v.) and Voltaire (q. v.) represent the two grand phases of the intellectual movement that precipitated the Revolution—the extravagant enthusiasm for 'nature' and the profound contempt for 'superstition.' The reign of the first Napoleon was fatal to all imaginative literature; but the restoration of the Bourbons and the Revolution of 1830 witnessed more than a revival of the splendour of French fiction. The names of Balzac (q. v.), Paul de Kock (q. v.), the elder Dumas (q. v.), George Sand (q. v.), Lamartine (q. v.), Eugene Sue (q. v.), are the most famous of the past generation; of the present, none equals Hugo (q. v.) in grandeur of genius, or surpasses Dumas fils in subtlety of vice. All varieties of style are illustrated by the names of Merimée (q. v.), Murger (q. v.), Gautier (q. v.), Alphonse Karr (q. v.), and Messieurs Erckmann-Chatrian (q. v.).—German fiction first reaches excellence in the N. of Wieland (q. v.), which breathe a classic epicureanism. Before the end of the 18th c. a crowd of obscure writers appeared—the crude precursors of that Romantic school which is adorned with the exquisite art of Tieck (q. v.), Musæus (q. v.), and Fouqué (q. v.). Goethe (q. v.) is too universal, and Richter (q. v.) too unique a genius to be classified. Chamisso (q. v.), Steffens (q. v.), Brentano (q. v.), Zachokke (q. v.),

Auerbach (q. v.), Hoffmann (q. v.), Freytag (q. v.), Heyse (q. v.), and scores of others prove the fecundity and variety of German fiction, which faithfully reflects the national peculiarities in its depth and dreaminess of sentiment, its quiet lovable humour, its slow and somewhat heavy movements, and its patient development of character. Italy can boast of the world-famous *Promessi Sposi* of Manzoni (q. v.), who has founded a school of historical fiction in which the foremost names are Rosmini, Grossi, Cantu, D'Azeglio (q. v.), and Guerrazzi (q. v.); Spain has a brilliant list, Saavedra, Mora, Romero y Larranaga, and above all Fernan Caballero (q. v.) being known far beyond the Pyrenees; Belgium is proud of its Flemish genius Hendrick Conscience (q. v.); Holland is rich in writers, some of whom at least have more than a national reputation, Lennep (q. v.), Bogaers, Meyer, Ter Haar, Oltman, Tonsaint (q. v.), Cremer, Schimneel, Brouwer, Linde, and Dekker. For some notice of Danish, Norwegian, Swedish, Russian, and Hungarian novelists, our limits compel us to refer to the articles on the literatures of these countries. American fiction may be regarded as part of English fiction. It will always find expression through the English tongue, and it will always continue to be affected by the literary associations of that tongue. But more and more distinctly, as years pass on, will the differences of social and political life come to be reflected in this infallible mirror. From the first a certain idiosyncrasy was visible. Even Washington Irving (q. v.) and Brockden Brown (q. v.) are not destitute of a New World aroma, which is stronger in Poe (q. v.) and Holmes (q. v.), intense in Fenimore Cooper (q. v.), Hawthorne (q. v.), and Mrs. Beecher Stowe (q. v.), and in Bret Harte (q. v.) seems at times to pass into a fresh and original perfume. See Dunlop's *History of Fiction* (Lond. 1814), Wolff's *Allgemeine Geschichte des Romans* (Jena, 1841), Chassang's *Histoire du Roman dans l'Antiquité Grecque et Latine* (Par. 1862).

Novem'ber (from Lat. *novem*, 'nine'; old High German *Harbistmānth*, 'harvest month'), the ninth month of the early Roman calendar, after the addition of January and February, became the 11th. It has thirty days, and is the first of the three winter months. On the 21st or 22d N. the sun enters Sagittarius.

Novgorod, or Veliki-Novgorod ('great new-town'), the capital of a government of the same name, Russia, on the Volkhov, near its issue from Lake Ilmen, 125 miles S. by E. of St. Petersburg by rail. It is divided by the river into the *Sophia*-town and the *Trade*-town; and these are connected by a beautiful bridge built on granite piles. The Sophia or old portion of the town is still girt with walls, and includes the Kremlin with its old cathedral, containing the shrine of St. Ivan of N., which attracts great numbers of pilgrims. The celebrated *Chersonese* gates of the cathedral appear to be of old German workmanship in imitation of Byzantine art. N. has thirty-four other churches and an imperial palace, and outside the walls are several convents—St. George's at the outflow of the Volkhov especially possessing immense treasures. Pop. (1870) 17,093. Founded by Prince Rurik in 864, N. in the 12th c. formed a free state, and extended its power to the Arctic Ocean and to the Obi. In the time of the Hansa it was one of the most important trading towns in Russia. It excited the jealousy of the Muscovite princes towards the close of the 15th c., was almost destroyed in 1478 by Ivan III., and declined rapidly thereafter. The opening of Archangel and the foundation of St. Petersburg greatly damaged its foreign trade.—N., the *government*, lies E. of that of St. Petersburg, and encloses the whole Valdai plateau. The Valdai hills in the S. form the common watershed of the Baltic, Caspian, and White Seas. The surface is undulating, and lakes are numerous; but the soil is poor, only one-seventh of the whole area being under grain, hemp, and flax. Forests and pasture lands, however, are extensive; and timber floated down the rivers and canals is an important article of trade. Area, 47,213 sq. miles. Pop. (1870) 1,016,414.

Novgrad-Volynsk, a town of W. Russia, in the province of Volhynia, 50 miles N.W. of Zitomicz. It has important manufactures in cloth, leather, &c. Pop. (1870) 9341.

No'vibazar, a town of European Turkey, in the vilayet of Bosnia, 140 miles S.W. of Widdin, on the Rashka, a mountain

stream which ultimately mingles its waters with the Danube. It has celebrated fairs and an important trade, and in its vicinity are warm springs. Pop. 9000.

Nov'ice (from Lat. *novus*, 'new') was the name given in the early Church to a newly baptized person (see 1 Tim. iii. 6), and was afterwards applied like Neophyte (q. v.) to a Catechumen (q. v.). Nowadays it is applied to one who is undergoing a period of probation (called a novitiate) and a system of discipline preparatory to becoming a monk or a nun. At the end of the novitiate, which varies in length in different orders, the N., if still inclined, is 'professed' or receives the vows of the order.

No'vi Ligu're, a town of Italy, in the province of Alexandria, 33 miles N.N.W. of Genoa by rail, contains twelve churches, a museum, picture gallery, and public library, and has important silk manufactures. Pop. (1874) 12,162. Here the French were defeated by a Russo-Austrian army under Suvaroff, and lost Joubert, their general, and 16,000 men, August 15, 1799.

No'vomoskovsk ('New Moscow'), a town of S. Russia, in the province of Ekaterinoslav, on the Samara, an affluent of the Dnieper, 17 miles N.E. of the town of Ekaterinoslav. It has three extensive annual fairs for the sale of cattle and horses, also manufactures of leather, tallow, &c. Pop. (1870) 10,515.

No'votcherkask ('New Tcherkash'), the chief town in the territory of the Cossacks of the Don, S. Russia, on the Aksai, an arm of the Don. It was founded in 1805, is the residence of an archbishop, and has a large cathedral, seven churches, the courts of justice, and a large annual fair. Pop. (1870) 18,611.

Nowanuggur (*Nāwanagar*, 'new town'), the chief town of the native state of the same name, in the peninsula of Kattywar, India, on the S. shore of the Gulf of Cutch, 160 miles S.W. of Ahmedabad; pop. (1872) 34,744. It is a flourishing place, with a special manufacture of dyed cotton cloth, large quantities of which are exported to the Arabian and African markets. The state of N. comprises 633 villages; pop. (1872) 290,847; revenue, £150,000; tribute to the Guicowar and the British, £12,000. It has a great extent of sea-coast; and it is said that Poshetra and Seria, though not now used, are the two best natural harbours in India. The chief, whose title is Jam, is of the Jareja caste of Rajputs, and the family are said to have immigrated from Cutch about 1422. He is the second chief in Kattywar.

Nowgon (*Nāngān*, 'new village'), the chief town of the district of the same name, Assam, British India, on the left bank of the Brahmaputra; pop. (1872) 2883.—The district of N., which lies between the river and the Naga Hills, has an area of 3415 sq. miles; pop. (1872) 256,390. In 1874 there were 2878 acres under tea cultivation, yielding 387,085 lbs.; 5 Europeans were employed, and 2600 natives. In 1876-77 the exports by river were £184,000 worth of tea, and £9000 of caoutchouc; the imports included piece-goods (£18,000), salt (£6000), and liquor (£4000).—There is another town of the same name in Central India, which is the headquarters of the Bundelcund Agency, and a station for a battery of European artillery.

Noyades were a series of 'drownings' executed by Carrier, deputy of the Convention, at Nantes during the French Revolution. Priests, women, and children were packed into flat-bottomed craft, which were scuttled in the middle of the Loire. There were twenty-five of these 'sentences of deportation executed vertically.' See *Procès de Carrier* (4 vols. Par. 1795).

Noyau, or Crème de Noyau, a favourite liqueur, the characteristic flavour of which is due to the presence of a minute proportion of the essential oil of bitter almonds, derived either from bruised almonds or from peach or apricot kernels. Other flavouring ingredients are in some cases added, and, as with all true liqueurs, the drink is sweetened with fine sugar.

Noyon, a town of France, in the department of Oise, on the Verze, 77½ miles N.N.E. of Paris by rail, has a cathedral (founded by Pippin the Short, and rebuilt 1180), an hôtel-de-ville (1485-1523), the house where Calvin was born, and other historical buildings. There are manufactures of cotton, hosiery, and vinegar, and a trade in corn, wine, leather, and wood. Pop. (1872) 5236. The *Noviomagus* of the Romans, N. was the scene of the consecration of Karl the Great (768), and of the election of Hugues Capet (987).

Noy, William, born at St. Buryan, Cornwall, in 1577, from Exeter College, Oxford passed on to Lincoln's Inn. As a member of Parliament he at first attached himself to the 'Country Party,' but, being made attorney-general in 1631, went over to the Court, and is chiefly remembered as author of the tax called Ship-Money (q. v.). He died in August 1634.

Nubia, the *Cush* of the Bible, and the *Ethiopia* of the Romans, is the middle part of the territory subject to the Khedive of Egypt, being bounded N. by Egypt, E. by the Red Sea, S. by Abyssinia, and W. by Darfour and the desert of Sahara. On account of its ill-defined boundary towards the W. and partly towards the S., the area is variously estimated at 300,000 and 500,000 sq. miles. The pop. is about one million. The surface consists of a series of extensive plateaus, that of Sennar 1377 feet above the level of the sea, and that of Kartoom 1263 feet, through which the Nile descends from Abyssinia, and which are bounded E. and W. by ranges of low hills separating N. from the Red Sea and the Sahara. The climate is extremely hot, though, owing to its dryness, not unhealthy. With the exception of a few oases of small extent, the ground is cultivable only in the Nile valley, which is here a ravine from five to nine miles broad, with steep banks, and can be overflowed by the river only in a few places. Hence the people are forced to draw up most of the water for irrigation by means of various mechanical contrivances. The Nubian desert to the E. of the Nile consists of rocky mountains, separated by deep wadies or ravines. On the W. side, in the great bend of the Nile, lies the desert of Bahjuda, a sandy steppe offering extensive pasture for camels. The chief exports are gums, dates, and senna leaves; though durra, tobacco, and the sugar-cane are also grown to some extent. The slave traffic can now be carried on only in secret, and in obscure places. The chief towns are Massana, Iherber, Dongola, Abu Hammed, and Korosko. The first is the principal port of the province on the Red Sea. The population consists of Nubians, who to the E. of the Nile are much mixed with the Arab element, and, in the S.W., of negroes, who belong to the stem of the Fundi. The Nubians call themselves Berâbra, and live chiefly between the two last cataracts. They are of medium height, of reddish-brown colour, with slightly curling hair, a pleasing expression, and often almost European features; the head is small, the forehead high, the nose straight and well formed, the eye large and black, and the muscular development slight. They are industrious, temperate, truthful, and honest, and are in much request among the Egyptians as servants. Until their eighth or tenth year both sexes go quite naked; then the boys put on a linen shirt, or merely a girdle, while the girls wear until their marriage a *rachat*, consisting of a girdle with a long fringe. The women dress themselves in loose trousers and mantles of blue cloth, with which they also cover their heads. The men shave the head with the exception of a tuft on the crown, the females letting their hair, which they soak in ricinus oil, fall over their neck and shoulders in numerous thin braids. The Berâbra marry early, the girls in their eleventh or twelfth year; and the richer men generally have several wives. The dwellings consist of small square houses with flat roofs, built of sun-dried clay or mud bricks. The furnishing is very simple; the water is kept in large bomb-shaped vessels, and mats of palm-leaf serve as doors, carpets, and mattresses. The principal article of food is millet, flesh being little eaten. Agriculture and cattle-rearing are almost the only occupations. In religion the Nubians are all Mohammedans. Besides the Berâbra, there belong in a wider sense to the Nubians those races included under the name Bedshah, viz., the Shâkîeh, S. of Dongola, the Besharin, S. of the 23^d in the desert, with the related tribe of the Shukuriah, who occupy the valley of the Atbara, and the inhabitants of the Bahjuda desert, the Hasânteh and the Kababîsh, whose territory reaches to Kordofan. About the middle of the 5th c. the Nubians had founded a great kingdom which reached to the highlands of Abyssinia, and of which Dongola was the capital. In the 6th c. Christianity penetrated N. and gained over the majority of the population. It flourished for eight centuries, during which period were erected those numerous monasteries the ruins of which are still to be seen in the Nile valley. But in the 14th c. N. was conquered by the Arabs, under whose rule Islamism became the national faith. In 1820 N. was subdued by Ismail-Pasha and united to Egypt. Besides the

works of Burckhardt, Rüppell, and Russegger, see Kremer's *Aegypten* (2 vols. Leips. 1863), and Hartmann's *Naturgeschichtlich-Medic. Skizze der Nilländer* (Berl. 1865).

Nu'cha, a fortified town in the Russian government of Baku (Transcaucasia), on the Kish-Tchai, which falls into the Alazan, a tributary of the Kur, 125 miles E.S.E. of Tiflis. N. consists of a Tartar town, with 2 large and more than 20 small mosques, and an Armenian town, the seat of an archbishop, with 3 churches. It has large manufactures of silk, and the surrounding district is covered with mulberry woods. Pop. (1870) 23,371, chiefly Mohammedans of the Shiite sect.

Nu'cleobran'chia'ta or **Heterop'oda**, the highest order of the class Gasteropoda (q. v.), including those molluscs which have a univalve shell, while the 'foot' is converted into a vertically-flattened fin. Sometimes the shell is wanting. They are found chiefly in warm seas. The flattened fin or foot may be provided with a sucker, by means of which the N. can attach itself to seaweed and other objects. Two families (*Atlantida* and *Fiolida*) are included in this group. The *Atlantida* are numerous represented as fossils in the Palæozoic rocks; the *Fiolida* are represented by a single fossil species in the Miocene formations (Tertiary).

Nu'cleus, the name applied to the solid particle found in the interior of *Cells* (see CELLS), and also named the *endoblast*. The N. may contain and have attached to it another and smaller particle, the *nucleolus*. There can be little doubt that wherever occurring in cells or cellular organisms, both N. and nucleolus are concerned in the work of *reproduction*. The N. may in fact be named the 'reproductive centre' of the cell. In the lowest animals or *Protozoa* (q. v.) a *nucleus* is almost invariably found. It occurs in such *Protozoa* as *Amœba*, *Foraminifera*, *Infusoria*, *Gregarinæ*, &c. That the N. is concerned with development and reproduction becomes apparent when its relations to the *germinal vesicle* of the *ovum* or egg are considered. After fertilisation both N. and nucleolus disappear or become so modified as to be unrecognisable, and hence the importance of these structures as the essential parts of the egg may be readily proved. The N. found in *seeds* or *ovules* of plants is a different structure from the N. of cells. See SEED.

Nudd'ea (*Nadiya* or *Nabadwip*, 'new island'), a town, though not the chief town, in the district of the same name, Bengal, British India, on the right bank of the Bhagiratti, the most direct mouth of the Ganges, 60 miles N. from Calcutta. Pop. (1872) 8863. It was the capital of the last independent king of Bengal, and is a holy place for bathing pilgrimages. It is still a centre of Sanskrit learning, where the pundits lecture, especially on logic, in poor mud huts. Former sites of the town have repeatedly been swept away by changes in the river course.—The district of N., which lies at the head of the Gangetic delta, has an area of 3421 sq. miles. Pop. (1872) 1,812,795. It is very fertile, and is traversed by many navigable rivers, and also by the railway. It exports indigo, silk, pulses, wheat, jute, oil seeds, sugar, chillies, and other vegetables, but requires to import rice. The manufactures are brass-ware, cotton cloth, and clay figures. In 1876-77 the value of the registered traffic was upwards of £2,000,000. The chief towns are Krishnuggur, Santipore, and Kuslita. N. was the chief scene of the indigo riots of 1860, but the European cultivation of that dye is now reviving, the export in 1876-77 being valued at £240,000.

Nudibran'chiate (Gr. 'naked-gilled'), a section of *Gasteropodous* molluscs, in which the *branchia* or gills are exposed on the back of the animal or on the sides of the body; a shell being absent in the adult state. Examples are the *Doris* or 'Sea Lemon,' the *Æolis*, *Glaucus*, *Elysia*, &c.

Nu'dum Pac'tum is in law an agreement without Earnest (q. v.) or Consideration (q. v.). *Nuda Pacta* are void in law.

Nue'ces, a river of Texas, U.S., rises near the country of the Comanches, flows in a south-easterly direction, and falls into Corpus Christi Bay, in the Gulf of Mexico, after a course of 300 miles.

Nugg'et (a corruption of *Ingot*), a miner's term for a lump of native gold of any size. The largest masses, usually of very great purity and containing very little disseminated quartz, are found in the alluvium of auriferous districts. The names,

places, and year of discovery, and weights of several of the largest known nuggets are given below.

	Gross Weight.
	oz. dwts.
'Welcome Stranger,' Dunolly, Victoria, 1869 . . .	2280
'Welcome,' Ballarat, Victoria, 1858 . . .	2217 16
'Blanche Barkly,' Kingower, Victoria, 1857 . . .	1743 23
'Precious,' Berlin Diggings, Victoria, 1871 . . .	1621
A N., Ballarat, Victoria, 1853 . . .	1619
A N., Burrangdong, New South Wales, 1858 . . .	1286
A N., near Bathurst, New South Wales, 1851 . . .	1272
A mass found at Miazak, Ural Mountains, 1842 . . .	1158
'Lady Hoiham,' Ballarat, Victoria, 1854 . . .	1177
'Viscount Canterbury,' Berlin Diggings, Victoria, 1870 . . .	1105
'Viscountess Canterbury,' Berlin Diggings, Victoria, 1870 . . .	884
'Kum Tow,' Berlin Diggings, Victoria, 1871 . . .	718

Nuggur (*Nagar*), sometimes also spelt Nagore, a term of Sanskrit origin meaning town, commonly used throughout India either as a suffix or by itself. According to Hindu authorities the name should be reserved for cities with 100,000 houses. The most noted towns of this name are: (1) in the district of Tanjore on the sea coast, 160 miles S. of Madras, conspicuous to mariners by its five white pagodas; (2) in the district of Beerbhoom, Bengal, 134 miles N.W. of Calcutta. This was the capital of a long line of Hindu and Mohammedan princes, whose descendant still lives there in poverty, and it contains many ruins of palaces, mosques, and tanks; (4) in the native state of Bikanir in Rajputana, with an estimated pop. of 20,000; (5) in the district of Shimoga, Mysore, a former capital of that state; pop. (1871) 1295. When Hyder Ali sacked this town, he is said to have obtained a booty of £12,000,000.

Nuisance. In England nuisances at law are *public* or *private*. A public N. is an offence against the state punishable by fine. The remedy for a private N. is a civil action at the instance of the person aggrieved. Procedure for prevention or removal of N. is by Injunction (q. v.), or in Scotch law, by *Interdict* (q. v.). To obstruct a highway, or a public river, or to keep a gaming house is a public N. To conduct an offensive business, that of a tallow-melter, for instance, may be a private N. In the case of the Duke of Northumberland *v.* Clowes, when the defendant employed in his business a steam-engine which caused noise and vibration in the plaintiff's house adjoining the premises of the defendant, it was held to be a N. The common law of N. has been materially altered by the Public Health and Nuisances Removal Act 11 & 12 V. c. 63, 18 & 19 V. c. 116, and 35 & 36 V. c. 79. The general scheme of these Acts is to enable districts to appoint local boards with ample powers regarding sanitary measures, such as the providing efficient drainage and introducing sufficient water-supply, and for the levying of rates to carry out and maintain the same. The absolute right which a man has to the use of his property is not limited merely because the use he makes of it causes inconvenience to his neighbour. Circumstances have always great weight in determining whether an operation is a N. or not. It makes a great difference when works are established, whether or not they are so in a populous neighbourhood or in a place thinly or not inhabited, whether or not in a part of a town where similar works already exist. One coming to a N. has no legal right to complain of it.

Nulchitt'y (*Nalchiti*) a town in the district of Backergunge, Bengal, British India, on the Burrisal river, 130 miles E. of Calcutta. Pop. about 4000. It is a mart of some standing, and a great centre of collection and distribution; exports rice and betel nuts to the value of £186,000; imports cotton goods, sugar, tobacco, oil, and salt, valued at £358,000. In 1875 the bill transactions of native bankers were ascertained to amount to £638,000.

Nullification, a doctrine formerly held by that section of the United States politicians which insisted on the sovereign right of States to reject any law of Congress which it considered unconstitutional, and to secede from the Union if its enforcement were attempted. The leader of this party in the memorable controversy of 1832 was John C. Calhoun. The result of the Civil War (1861-65) has been to annihilate the doctrine, which now possesses only a historical interest.

Numantia, the capital of the Arevaci in Hispania Tarraconensis, and the most celebrated city of the Celtiberi, was situated on a steep eminence skirted by the *Lurius* (*Douro*). The destruction

by Scipio Africanus of N., B.C. 134, after a siege of fifteen months, during which the Celtiberi displayed heroic endurance, has furnished a not unworthy theme for the pens of Appian, Eutropius, Cicero, and Strabo. It was not a walled city, but was defended simply by ditches and entrenchments. The ruins of N. may still be seen at Puente de Don Guarray. See Aldrete, *Ant. Hisp.* i. 6; D'Anville, *Mém. de l'Acad. des Inscript.*, vol. xl. p. 770, cited by Ukert, vol. ii. pt. i. p. 455.

Nu'ma Pompilius, successor of Romulus, according to Roman legend, was a Sabine of Cures. Romulus, as his birth betokened, was the representative of the war element; N. succeeded him to inaugurate the arts of peace and the reverence for religion and law. By the aid of the nymph Egeria he elaborated his scheme of culture and discipline; and during his long and peaceful reign he founded and established the Roman religious orders, viz., Pontiffs, Augurs, Flamens, Vestal Virgins, and Salii. In his time the temple of Janus was always shut, and at last, after a reign of thirty-nine years, N., like the beloved of the gods, fell asleep, and Egeria disappeared like the gentle rain. The story is one of the most beautiful of the early Roman legends. The connection of N.'s name with Gr. *nomos* ('law') belongs to the realm of pure fancy. The sole germ of truth in the tradition regarding him seems to lie in the fact that at an early period the religious system of the Sabines took root in Rome. In N.'s time the Etruscan element was quite undeveloped.

Numbers, Book of, the fourth book of the Pentateuch (q. v.), is so called from its giving an account of the numbering of the Israelites before they left Sinai (i.) and again in the plains of Moab (xxvi.). The contents may be divided into four principal sections:—1. Ch. i.-iv., the numbering of the Israelites, forming them into a camp, and the appointment of the Levites; 2. v.-x. 10, the institution of various ceremonies, civil and religious; 3. x. 11.-xxi., the journeyings from their leaving Mount Sinai in the second month of the second year after the Exodus, till their arrival in the land of Moab in the fortieth year; 4. xxii.-xxxvi., a history of the transactions on the plains of Moab.

The traditional view is that the B. of N., like the rest of the Pentateuch, was written by Moses; the following real or apparent chronological and other historical discrepancies have been pointed out by critics as proving that, in its present extent and form, it cannot have been composed by Moses:—1. the quotation xxi. 14; 2. the way in which the narrative of xv. 32-36 begins; 3. the unsuitable position of ix. 15-23, cf. Ex. xi. 34-38; 4. the chronological discrepancy between i. 1 and ix. 1; 5. the great gap in the history of about thirty-eight years (cf. xx. 1-23, 29, xxxiii. 38); 6. the discrepancies between viii. 23 and iv.; 7. chap. iii. as compared with i., ii., and iv.; 8. the relation of xxxiii. 1-49 to the last of the book; 9. certain repetitions, e.g. in xiv. 5-10, 26-38, cf. xiii. 1-xiv. 4, 10-25, 39-45. See Bleek's *Einführung in d. Alte Test.* (Eng. trans. 1869).

Numbers, The'ory of, is a branch of pure mathematics, which seems to have very little connection with other branches of the science, except perhaps the solution of equations. Consequently it is very little studied by the majority of mathematicians, and cannot be expected to be otherwise until it has developed more in its applications. To give an idea of its scope would be out of place here; but under the article PRIME some details will be given. To the mathematician who turns his attention to it the subject seems to have peculiar charms. The theorems established by Fermat were extended and classified by Gauss and Legendre independently, whose treatises *Disquisitiones Arithmetica* (1801) and *Théorie des Nombres* (1830) are the classical works in the whole literature of the subject. Memoirs by Euler, Jacobi, Dirichlet, Lagrange, Eisenstein, Poinset and others are to be found in the leading scientific journals and transactions; but no beginning seems yet to have been made in the direction applicative of the principles of the T. of N. to physical questions. A full and critical history of the subject will be found in Professor W. J. O. Smith's *Reports on the T. of N.*, the first of which appeared in the Transactions of the British Association for 1859.

Numerals are the symbols by means of which numbers are expressed. Our present common system of N., which is capable of expressing any number by the combination of symbols, of which there are but ten distinct forms, is traceable through the

Arabs to the Hindus. They are ordinarily called the Arabic numerals, and are probably the corrupted forms of an older set of representative symbols, whose numerical significations were more evident. There is no doubt that the first instruments of calculation were the fingers; and, as these number when normal ten, numbers were naturally grouped in tens. Had the generality of mankind possessed twelve fingers, we should have as naturally grouped our numbers in dozens. Sixteen would have then corresponded *in name* to fourteen, and might have been called four-twelve. Of course twelve distinct symbols would have then been necessary. The following development of our ordinary N. is ingenious, and, from its resemblance to the undoubted development of the Roman N. (I., II., III., IIII., &c.), plausible. The origin of I is obvious; 2 may be brought from — through Z, which would result easily through rapid writing, and so on with the others. The following table gives in this theory the possible original forms compared with the ordinary symbols:—

I	=	≡	□	5	5	7	8	9
I	z	≡	4	5	6	7	8	9
I	2	3	4	5	6	7	8	9

The first row consists of combinations of *straight* lines only.
The second row is what the first might become in consequence of rapid writing.

The third comprises our ordinary numerals.

The Roman N, though unsuited for calculation, are conveniently used for numbering successive sections, chapters, divisions, &c. Of the two forms of four, IV. is obviously modern, and must be read as equivalent to one before V., so VI. is one after five, VII. two after five, &c., IX. one before ten or X. and so on. The origin of V. and X. is explained in two very distinct ways. By some V. is regarded as a symbol for the hand with fingers and thumb displayed, and X. similarly the symbol for both hands together. By others X. is looked upon as an abbreviation for the crossing out by a diagonal line of each group of originally ten successive strokes; and similarly C. or one hundred is explained as the final form of a similar operation effected by two longitudinal lines upon each group of originally ten tens. V. is then explained as half of X., and L. or fifty as half of C.

The ancient Greek system of N. deserves a passing word, though it is a purely artificial system. They divided their twenty-four letters of the alphabet into three groups, and by adding a new symbol to each, obtained symbols for units, tens, hundreds, with intermediate numbers expressed exactly as we express them. Thousands, tens of thousands, &c., were represented by repeating the old symbols distinguished by a prefixed tick. This system was far superior to the Roman for calculating purposes, and if they had had a cipher might have easily developed into as effective a method as our modern one.

Numeration is the system of naming numbers. The necessity for some systematic method is evident when it is considered that the number of possible numbers is infinite while the number of words in use must be finite. The denary scale, which is universally employed among civilised nations, is perhaps as convenient a scale as we could get. The nine units of the first order receive particular names. The unit of the second order is ten, and by combining this word with the other units all numbers up to ninety-nine are named. With a hundred a new unit is required, and so with a thousand. These, however, suffice till we reach a thousand thousands or a million, and so on up to billions and trillions. These latter names are rarely used, and indeed there is no definite universal meaning attached to them. The French call a billion a thousand millions; in this country we regard it as equivalent to a million millions. See NOTATION, NUMERALS.

Numidia (Gr. *Nomadia*, 'the land of nomads'), anciently the name given to that part of the N. coast of Africa corresponding partly to the modern Algeria (q. v.). It was bounded N. by the Mediterranean; E. by the river Tusca (now Wadi-el-Berber) which separated it from the territory of Carthage, afterwards the

Africa propria of the Romans; W. by the Mulucha (mod. Muluja), the limit of Mauretania; and S. by the ranges of the Atlas, which shut it off from Getulia and Libya. The inhabitants, like the Mauretians, belonged to the Berber race (see BERBERS). They were strong, warlike, fond of a free life, and splendid horsemen. Among the numerous peoples into which they were divided, the most important were the *Massyli* in the E. and the *Massaylli* in the W. Masinissa, king of the former, and an ally of Rome, first welded the various nomadic tribes into a state. Of his successors, the most notable was Jugurtha (q. v.). After the defeat of Juba by Cæsar, B.C. 46, the larger part of N. became a Roman province. The western part was joined to Mauretania, and when the latter also became a Roman province in the reign of Claudius, it was split into two, the part to which N. was annexed being called *Mauretania Casariensis* (from the town of Cæsarea; mod. Tenez), and the other *Mauretania Tingitana* (from the town of Tingis; mod. Tangier). Among its great cities during the Roman period were Hippo, Lambæse, and Cirta (now Constantine). Its subsequent history is traced under Algeria. See Davis, *Ruined Cities within Numidian and Carthaginian Territories* (Lond. 1862), and Nau de Champlouis, *Carte de l'Afrique sous la Domination des Romains* (Par. 1864).

Numismatics (from Lat. *numisma*, a 'piece of money,' a 'coin') is the science of the description and interpretation of coins and medals. The leading technical terms are obverse, reverse, field (what is clear of design), legend, exergue (or lowest design). If coins had always been what modern coins are, mere crowned heads and heraldry with legends repeating political titles and the value of the money, this would not have been a fruitful science. But as in the local token coinage, which England had from 1770 to 1820, when 'Sheffield pennies' bore the heads of Nelson, Newton, or Wellington, with appropriate patriotic mottoes, so in the ancient world it was understood that coins had nobler uses than to pay reckonings with, and even where, as in Athens, a great commerce rendered necessary a constant mark (Pallas and the Owl) it was found possible to celebrate almost all great political events upon the coins, which thus became not mere currency or chronology, but an æsthetic abstract of the times. As Pope says (*Moral Essays*, Ep. V.),

'Beneath her palm here sad Judæa weeps;
Now scantier limits the proud Arch confine,
And scarce are seen the prostrate Nile and Rhine;
A small Euphrates through the piece is rolled,
And little eagles wave their wings in gold.'

They show art, commerce, laws, conquests, treaties, religion, language, all social life. The necessity of N. in settling dates is obscured by the great mass of materials, and by the fact that the evidence is broken up into many isolated portions. The pre-Christian coins (viz., before Constantine the Great, by which time the local mints had ceased to issue coins, and the *nummi tincti* or washed copper were taking the place of silver) extend from Eboræ in Portugal to Bactria in Central Asia, and from Cunobelin in Britain to Coptor on the Nile and over a period of one thousand years. Thus Leake in his *Numismata Hellenica* has shown clearly the immense geographical range of Greek institutions, of much of which no other record remained. The Athenian Owl is found on the same *staters* and *obols* as the Corn ear of Sicily, the Elephant of Africa, the Pegasus of Corinth, the Sphinx of Egypt, the Rose of the Rhodians, the Lion of Leontium, &c., thus indicating close commercial relations. The silver tetradrachma of Alexander the Great—with its head of Hercules, with the lion skin, and the sitting Jupiter—was used over a great part of his empire long after his death. Again, Athens had no gold, while the frequent silver didrachma of Etruria and Magna Græcia indicates high prices or abundance of metal. A comparison of the silver and copper coinages of Syracuse shows that the value of the two metals was in the ratio of 445 to 1; and the three great cities of Corinth, Syracuse, and Athens seem to have adjusted their currencies for mutual convenience. The early supremacy of Argos and the importance of Chalcis and Eretria, in the 7th c. B.C., depend for proof on the Argive and Æginetan coins of Phidon and on the prevalence of the Euboic standard of weight money. The Zeus Ikmaios, the Bee and the Amphora with a rough quadratum in cussum crossed by diagonal lines and the name Carthæa, show that Ceos was an agricultural Phœnician colony which adopted the Solonian standard of coinage. From

the style of the die-engraving, too, inferences may be drawn as to the state of the contemporary arts, and from them to other elements of social progress. The divisions of provinces are often determined by the phrase *and* or *katō* used on the coin; and the sites of forgotten cities are found in the local deposit, especially of copper coins. Again, it is almost entirely on the scale of weights, the designs, and the alphabet used on coins that the evidence rests for the connection between Athens and Etruria, and between Sicily and Latium, where the talent, drachma, obol, and mina system coalesced with the pound and ounce system. An Athenian coin has even been found on the Etrurian Amber Route in Posen. All we know of Poseidonia or Pæstum (except that roses grew there) and of Sybaris comes from the coins. Alliances between Rome and other Italian cities are recorded by coins bearing both names and a figure named *Pistis* or Faith. While silver pieces in Greece were thick, often stamped on one side only, and in general without inscriptions, the Italian Achæans cut large thin coins with inscriptions from two similar dies partly cut in relief, partly sunk. These were called encased, the style of impression protecting the coin from the counterfeit of plating inferior metal with their silver foil. The brilliant gold coins of Tarentum (mostly marked with the child of Taras riding a dolphin or with a horse-soldier) have been described in Combe's *Hunterian Catalogue*. The absence of the word *Basileos* from the coins of Hiero II. is supposed to confirm the popular and democratic tendency of his rule. Again the coins of Panormus show that the Greeks were there before the Carthaginians, who never adopted the Greek idea of a commercial currency. In the bilingual coins of Phistelia, &c., with Greek and Oscan characters written from right to left, a spica of wheat, dolphin and mussel shell, sometimes with the Pentagram or Pythagorean symbol of health, we find the history of the Samnite invasion of Magna Græcia. A Samnite coin, which calls Mutilus the Embratur (Imperator), shows the bull of Italy goring the wolf of Rome. The progress of Roman coins through the *aes rude* and *aes signatum* of the first copper casting to true coining, with inscription including the national Janus and ship's prow, and from the oblong stamped bars to oval elliptical and finally circular shapes was very slow and really depended on Hellenic art. The *aes grave* of Iguvium and Hatria contains a striking record of religion, writing and rude art; *inter alia* the bearded Bacchus. It was to avoid the enormous weight of *aes grave* that the Syracusan *litra argurion* was coined. Mr. Warren's *Essay on Greek Federal Coinage* (1863) points out that the uniformity and extensive currency of such coins as the Amphictyonic (with its veiled head of Demeter and the sacred Omphalos encircled by a snake) are tests of the strength of the various early Leagues in Greece. Forty-one towns accepted the Achæan coinage. Much information is given about individual cities. Nicomedia celebrates the reconciliation of her Senate and Commons, Tarsus her freedom from taxation, Tyre her right of sanctuary, Ephesus her worship of Diana, and the names of many civil officers are preserved in the same way. The Macedonian multilingual coinage has been for Lassen, Prinsep, and Wilson the key to the sepulchral inscriptions of the Bactrian Topes; dynasties of kings are formed from the 'saviours,' 'unconquered,' and 'king of kings,' mentioned on the coins; and the gradual declension from the pure Greek style, legends and types of the Seleucidæ, shows the breaking up of the empire. In the later ages of Rome the *Family Series* of coins arose from the practice of voting a certain amount of bullion to the magistrates for the time, who had it minted according to their own types. Hence such a mass of detailed information that the coins of the Romans have been called their *gazettes*. These family coins often represent some story of the gens; thus some Aemilian coins represent M. Lepidus as *Tutor Regis* giving the crown to Ptolemy Epiphanes, with the head of personified Alexandria on the obverse (see Akerman, *Roman Coins relating to Britain*). The *denarius argenteus* (copper plated with silver) was never able to drive the drachma out of the Eastern empire. At a much later date the coins throw unexpected light on social conditions. In Nerva's short reign several distinct doles (*Congiaria*) seem to have been given to the people; and the coins of the same reign record all we know of a tax called *vehiculati*. The chronology of Trajan and Hadrian is strangely dependent on their coins (see Clinton's *Fasti Romani*). We can only allude to the important uses of coins, especially bilingual, in the preservation of archaic alphabets. The Punic lines

in Plautus have been recovered in this way; and 'every philological fact is a history abridged.' The Celtiberian dialect stands half-way between the Phœnician and the Greek coins of Spain. Coins also throw light on passages in the classics, especially the poets, and embody important facts in music, mathematics, and mechanics. From Creuzer's *Symbolik* it may be seen what vivid ideas of mythology and of historical changes in religion are given by coins. The peculiarities of art on coins are supposed to have decided the Oriental origin of Greek and Roman religion. It was from coins that De Luynes constructed his theory of the lunar reference in the Greek Triads. The coins bear copies of public monuments, and in this way are histories of art. The rude disproportion and extravagant posture of the *Ægean* goat are succeeded by the magnificent coinage of Syracuse, contemporary with Phidias, and later (B.C. 400-350); the Peloponnesian and Tarentine coinage, in which the subjects become symbolical and melodramatic. The works of many great sculptors live only on the coins, which also contain the only portraits of some of the world's greatest men. The *dupondii* of Livia are supposed to be the finest of coin-portraits. Many of the allegorical figures, *spes*, *fides*, &c., have been perpetuated by the Italian painters. Although, therefore, allowance has to be made for conscious anachronisms, re-stamping with new dies, and forgery, the evidence of coins when you have deciphered them is generally admitted to be superior to that of other written records. In this notice we have endeavoured to explain by example the leading applications of N. Space forbids the enumeration of coins of different countries. The most important modern work on N. is the International *Numismata Orientalia* (named after Marsden's celebrated *Numismata Orientalia*, in the British Museum) now being edited by Mr. Thomas. It consists of contributions from numismatists all over the world. In 1875 appeared the editor's 'Indian Weights'; in 1876 Mr. S. L. Poole's coinage of the Turkoman Emirs; in 1877 Mr. B. V. Head's work on the coins of Lydia and Persia, down to the fall of the Achæmenidæ, in which he shows how these weight and money systems were derived from the *mina* recorded on the lion and duck weights of Assyria; and how the imperial currency which Croesus attempted to give to Asia developed into the royal currency of Persia. In 1877 also two large works have been published on the Coins of the Tuluni Dynasty in Egypt, by Mr. E. Rogers, Minister of Public Instruction at Cairo; and on the Parthian Coinage, by Mr. Percy Gardner. The last work especially shows the value of coins, for except the rock-sculpture of Goteztes and the ruins of Hatria there are no other monumental records of Parthian handiwork. On these coins, Greek as well as Pehliv characters appear: the Greek diadema and wreath as well as the Scythian bow; and the turreted female figures, clad in the long chiton and himation, represent the Greek towns in Asia. The names and figures of Arsaces (*basileus basilân*, *Arsakes*, *emergêtes dikaios*, *epiphanes*, *philhellênê*) and other kings and gods are given; and the dates are from the era of the Seleucidæ. The costume is more purely Parthian; and the puffed hair of the Persians is conspicuous. See, besides the later works mentioned in the article, Humphrey's *Coin Collector's Manual*, 1855; Mead, *Value of N.*, Arnold Prize Essay, 1864.

Nummulites. See NUMMULITIC FORMATION.

Nummulitic Formation is an extensive tract of limestone, belonging to the middle division of the lower Tertiary formations, and characterised by its wealth of *nummulites* (Gr. 'money-fossils,' a genus of *Foraminifera*, so called from their resemblance to coins). From Spain and Morocco this formation stretches along on both sides of the Mediterranean, through the Alps and Carpathians to Asia Minor, and through the Barbary States to Egypt, the stones of whose pyramids are quarried from it. It is traceable through Lebanon, the Caucasus, and Persia to India, and thence through the Himalayas and Altai Mountains to China. In all, its distinctive fossil character is preserved.

Nun (Lat. *nonna*, Gr. *nonis*) was a female who devoted herself to a monastic life (see MONACHISM), as *nonnus* was a monk. Convents for nuns were as ancient as for monks. The first was founded in the Egyptian desert by the sisters of St. Anthony and St. Pachomius, who were soon joined by 400 others. At the end of the 4th c. there are said to have been 40,000 in Egypt. The word N. is Coptic, and according to one writer means 'holy,' 'chaste,' according to another, 'paternal rev. rence,' and

according to a third is properly *Ennuenach* or *Nueneh*, 'one who is not of this world,' who has renounced the world. In the early centuries there were two kinds of consecration: a kind of perpetual novitiate made at home at the age of sixteen; and a perpetual vow made at the age of twenty-eight, or, according to other regulations, forty. In the middle ages there were also two classes of nuns; the 'mynchen' (Gr. *monachai*) or woman-monks, and 'nonne,' aged spinsters or widows, the former observing a stricter discipline than the latter.

Nuno *Dimittis* are the first words in Latin of the Song of Simeon (Luke ii. 29-32), which hence gets this name. It is one of the hymns appointed to be sung after the second lesson at even-song by the Anglican Prayer-Book.

Nunon'pative Will is a verbal will, which in Scotland is valid to the extent of £8, 6s. 8d. If the legacy exceed £8, 6s. 8d. it is still good for that sum, but ineffectual as regards the surplus.

Nundydrûg ('the fort of Nandi,' the sacred bull of Siva), a celebrated hill fortress in the district of Kolar, State of Mysore, India, 4810 feet above the sea, and 31 miles N. of Bangalore. The village at the foot has a cattle fair, attended by 50,000 people. The fort, which was reckoned impregnable, and had been strongly garrisoned by Tippoo Sultan, was stormed by Lord Cornwallis in 1791.

Nuneaton (Old Eng. 'nuns' water town'), a market-town of England, in Warwickshire, on the Anker, 9 miles N.N.E. of Coventry by rail, has three churches, a town-hall, market-house, and the ruins of a priory, founded in Stephen's reign. Iron-founding and manufactures of hats, ribbons, elastic webs, and edge-tools are the principal industries, and in the neighbourhood are extensive collieries and quarries of freestone. Pop. (1871) 7399.

Nunquam Indebitatus, in English law is the plea, in an action for debt, that no debt is due.

Nürnberg or **Nuremberg**, an old town of Bavaria, on the Pegnitz, 100 miles N. of Munich, with which it is connected by rail. An independent town of the empire till 1806, and formerly the wealthiest and most important of the free imperial cities, it is singularly rich in medieval architecture. The fortifications, perhaps the most interesting feature of the town, date from the Middle Ages, and are still in fair preservation; since 1866 they have been formed into promenades. The Pegnitz, which is here crossed by numerous bridges, divides the town into two nearly equal parts. The picturesque streets of N., with their quaint gables and balconies, are richly storied with beautiful carving. Of the many grand buildings the principal are the Gothic church of St. Sebaldus (12th-15th c.), containing rare sculptures and paintings; that of St. Lorenz (1270-1322), with its magnificent altar and superb windows; the Rathaus, erected 1616-19 in Italian Renaissance style, containing a great hall adorned with frescoes by Dürer; and the splendid Gothic fountain, originally of 1385-96, restored in 1821-24. The Burg or Imperial castle, founded in 1024 by Konrad II., is a Gothic structure rising on a sandstone rock, to the N. of the town. It was restored and presented to N. by King Max in 1855. A statue of Dürer by Rauch was erected in 1840. N. has valuable art collections, a town library of 40,000 vols. and 800 MSS., and a 'Germanische museum' (founded 1852, extended 1877) for the promotion of historical research, &c. Outside the town are extensive breweries and factories for the making of railway carriages, ultramarine, and chemicals. N. is famed for the production of watches, children's toys, carvings in wood, metal, and bone, lead pencils, and fancy wares. Pop. (1875) 91,017, of whom 7000 are Roman Catholics and 1200 Jews. N. owes its origin to the ancient castle, and is first mentioned in history in 1050. It became a free town of the empire early in 1112, and was the frequent residence of the Emperors Heinrich IV. and Barbarossa. The office of Burg-graf, at first that merely of a deputy of the emperor, was originally held by Friedrich I. of the Hohenzollern family, but his successors acquired independent power, and in 1363 styled themselves 'princes.' Imperial diets were held here in 1324, 1356, 1390, 1522-24. The Peace between the Reformers and the Emperor was concluded at N. in 1532. At the beginning of the 16th c. N. had become next to Augsburg, the chief seat of trade between Germany, Venice, and the East, and a great art centre. About this period it

was the residence of the painters Wohlgemuth, Dürer, Kulmbach, and Altdorffer, of the sculptor Adam Kraft, the brass-founder Vischer and his sons, the woodcarver Veit Stoss, the glass-painter Hirschvogel, and the minstrel Hans Sachs. The Reformation doctrines were favourably received at N. as early as 1525, and Melancthon founded the gymnasium in the following year. The discovery of a sea route to India greatly affected the prosperity of the town, which also suffered severely during the Thirty Years' War. Since it escaped the yoke of the patrician families and became a Bavarian city in 1806, N. has recovered in part its former prosperity, and is now the most important seat of trade and industry in S. Germany. See *Die Chroniken der Deutschen Städte vom 14. bis ins 16. Jahrh.* (vol. i. 'N.' Leips. 1862); Mayer, *N. und seine Merkwürdigkeiten* (3d ed. 1861), and the later work by Hagen (1867).

Nur Jehân ('light of the world'), the celebrated wife of the Mogul Emperor Jehangir. She was born at Kandahar, of a noble Persian family, and was married by Akbar to a courtier, with the object of removing her from the sight of the young prince. But when Jehangir became emperor, the husband, who refused a divorce, was killed, and, after some years of genuine reluctance, N. J. was made empress in 1611. Her influence was unbounded; her name was placed on the coins, and by herself and her relations she conducted the whole administration. She died in 1646, having survived her second husband nineteen years.

Nûrpûr ('the town of light'), the name of several towns in India. The largest is in the district of Kangra, in the Punjab, on a tributary of the Ravi River, among the S. Himalayas. Pop. (1868) 9928. It is situated on the main route to Cashmere, and commands an important trade. It has also an extensive shawl manufacture.

Nurse, Military. The system of sending trained nurses to the seat of war owes its origin to Miss Florence Nightingale, who with a few other devoted women rendered incalculable services to the suffering soldiers during the Crimean War. Her example had much to do with the international conference organised by M. Henri Dunant, held at Geneva in October 1863, and attended by representatives from most European governments. The United States Sanitary Commission did excellent work in organising nurses during the American Civil War. An account of their operations is given in *A Woman's Example and a Nation's Work* (Lond. 1864). Ladies of various nations have tended the sick and wounded in the Franco-German War (1870) and the Russo-Turkish War (1877). For general nursing see *Notes on Nursing* (1860) and *Notes on Hospitals* (3d ed. 1863), both by Miss Florence Nightingale.

Nursery, in its horticultural sense, is a tract of ground with numerous adjuncts, specially set apart for the propagation of plants of all descriptions. The name may be applied to that portion of a well-ordered garden where this is done simply for home use, but it is generally understood to refer to the 'farm' of the nurseryman, in which operations are conducted on a large scale for purposes of sale. It is here used in the latter sense. Necessarily it is impossible to enumerate all the various departments in the immense range of this business, but the following are some of the most important. Out-door, we have conifer ground for the common kinds, as larch and spruce, and for the choicer descriptions, such as Wellingtonias and araucarias for ornamental purposes; acres for forest trees, both utilitarian and ornamental; the same for fruit trees and shrubs; and vast areas for evergreens and deciduous shrubs, with special selections of those that possess a long series of varieties, such as the holly. We now also find the rock garden, with its display of alpine plants, &c., in many N., and a large portion is allotted to herbaceous and bedding plants, bulbs, &c. The ground under glass compares with a small village in extent, embracing propagating houses, fruit-houses, greenhouses, conservatories, stove-houses, hothouses, with orchid-houses, palm-houses, fern-houses, &c. In addition to the above are the semi-private departments where plants are experimented upon, and where new introductions are multiplied previous to being issued to the public. The Romans were the first original propagators of trees. France probably has grown and distributed more from her commercial nurseries than any other nation. Now-a-days in Britain, and indeed in every civilised country, inclusive of China and Japan, the nurseryman's business is widespread, and often individually very exten-

sive. A recent return gives the acreage of N.-ground in Great Britain as 11,743, of which the counties of Surrey and Edinburgh head the list with 1309 and 601 respectively. The American acreage is computed on good authority at 500,000, and that of France at 200,000.

Nursingpore (*Narsingpur*), the chief town of the district of the same name, Central Provinces, British India, on the W. bank of the Singree, a tributary of the Nerbudda, 562 miles N.E. from Bombay, and 53 W. from Jubbulpore. Pop. (1872) 7554. It is a station on the railway, and a centre of the grain and cotton trade of the Nerbudda valley.—*N. District*, which is constituted by the upper half of this valley, has an area of 1916 sq. miles; pop. (1872) 339,395. The staple crops are sugar-cane, wheat, gram, and cotton. A great fair at Bismar Ghaat, occasioned by the bathing of pilgrims in the Nerbudda, is attended by 75,000 persons, and goods are sold to the value of £40,000, chiefly English piece-goods, lac ornaments, and copper utensils. At Mopani is a coalfield, connected with the railway by a branch line of 8 miles. The output in 1873 was 11,000 tons. The miners are Gond.

Nursingurh, the capital of a native State of the same name in connection with the Bhopal Agency, Central India, 109 miles W. from Saugor. The State of N., which dates from 1681, has an area of 720 sq. miles. Pop. 87,000; revenue, £40,000; army, 98 horse and 65 foot; a tribute is paid to Holkar of £8500. The products are grain and opium. The State has been well administered, and the present Rajah was brought up under an English tutor.

Nusseerabad (*Nasirudd*, 'town of the defender'; so called after Sir David Ochterlony), the British cantonment in Rajputana, India, 15 miles S.E. from Ajmere, and 143 miles N. of Saugor. Pop. (1872) 18,336. Here is stationed the Rajputana Field Force of Europeans and Bombay sepoy; and sufficient riding camels are always kept in readiness for a forced march. The situation is hot, but healthy; and there is a sanatorium close by on the Taraghur hill, 3300 feet above the sea. In 1857, the Bengal sepoy then stationed at N. mutinied, and marched at once to Delhi. N. is also the native name of the civil station of the district of Mymensing (q. v.).

Nut is botanically a one-celled fruit with a hardened pericarp, surrounded by bracts at the base, and when mature containing only one seed. (In the young state the ovary contains usually three ovules, but only one comes to maturity.) It is illustrated by the fruit of the hazel and chestnut, which are covered by leafy appendages in the form of a *husk*; and by the acorn, in which the leaves or bracts are united so as to form a *cup*. The three layers of which the pericarp consists are in the N. so blended together as to appear one. The word N. used by itself, that is, without any prefix, is in popular acceptance understood to mean the fruit of *Corylus Avellana*, and in various varieties—more precisely called hazel N., cob N., Barcelona N.—of filberts. In a few cases, N. (which is etymologically connected with a series of words implying a round, hard lump), is applied to certain tubers, e.g., the earth N. (*Buntium flexuosum*). It is frequently used also in reference to the seed (in distinction to the fruit) of a plant. See *ACHENE*.

Nutation (Lat. *nutatio*, 'a nodding') is a small gyration of the earth's axis round its mean precessional position, due to the variation of the moon's attraction upon the earth's equatorial mass as the inclination of the lunar orbit to the ecliptic performs its cyclic change. Supposing for the moment the earth's axis to suffer no precessional motion, it would describe in virtue of N. a small ellipse, having a major axis of 18".5 and a minor axis of 13".74. The period of description is about nineteen years—is indeed the same in value as the Metonic cycle. In virtue of precessional motion, however, the earth's axis moves in a circle of much greater dimensions than those of the nutational ellipse, and the effect of N. is to transform the precessional path into a waved circular line. See *PRECESSION*. N. was discovered by Bradley, soon after his discovery of the aberration of light.

Nutcracker, the name applied to a species of Crow—*Nucifraga caryocatactes*—common in some parts of Europe, but rare in Britain. It is one of the true crows, and attains a length of 13 or 14 inches. Its colour is a deep brown on the top of the head. The other parts of the body are of a warm brown hue spotted with long white markings. The tail is dark or

blackish-brown. The nest is built at the end of a cavity scooped out by the powerful bill in the trunk of a tree, and the eggs, numbering five or six, are greyish-yellow spotted with dark hue. Clark's N. (*N. Columbiana*) is a shore-living species, of a light brown colour above and grey below. Its length is 13 inches.

Nut-hatch, the name given to various species of *Insectorials* or Perching Birds, allied to the *Certhida* or Creepers, and belonging to the section *Tenuirostres*. The genus *Sitta* includes the *S. Europæa* or common N., the most familiar example of the group. In this genus the bill is straight and the nostrils are in a broad groove. The wings have their first quills short and the third and fourth long. The tail is broad, and its feathers are very short. The tarsi are stoutly built, and the hinder toe is larger than the middle one. The common N. is agile in climbing the trunks of trees. Its colour is grey above with slate tints, and white on the throat, warming into reddish-brown on the belly. The tail is black with a grey tip. The nest of the N. is built in the hollow of a tree, and the bird defends its eggs and young with great courage and pertinacity. It feeds on insects, but chiefly lives on nuts, seeds, &c., breaking open the hard coverings of the fruits by aid of its strong bill.

Nutmeg is the albuminous kernel of several species of *Myristica*, a genus of trees and shrubs that gives name to the natural order *Myristicaceæ* (q. v.). They are natives of tropical countries, especially of India, and as a rule are aromatic, and abound in a reddish acrid juice. *M. fragrans* furnishes the chief supply of N. It is a handsome tree, from 20 to 30 feet high—pretty in form, foliage, blossoms, and fruit—somewhat similar in appearance to a pear tree. The fruit is smooth externally, and about the size, and something like an ordinary peach. It consists—first, of a rather thick fleshy covering, which when mature separates into two nearly equal longitudinal parts; secondly, of the aril or Mace (q. v.), which, when ripe, is of a bright scarlet colour; and thirdly, of the seed proper. The last has a smooth and hard outer coat, and a thin inner membrane closely investing and sending prolongations into the substance of the seed; these prolongations being coloured impart the marbled or mottled appearance characteristic of the N. The produce of this species are marked by their full and rounded form, and their delicate and aromatic flavour: they are called female N. *M. fatua* yields a kernel about half as long again as the above, of a pale colour, and less aromatic: it is sold under the name of long N. Another kind termed false, wild, or male N., and worthless as a spice, is chiefly the produce of *M. Malabarica*. The N. is cultivated in the Molucca Islands, especially the Banda group; also in Sumatra, Java, Penang (introduced 1798), Singapore (introduced 1819), S. India, Bengal, Bourbon, Madagascar, some of the W. India Islands, and Brazil. When the Dutch were masters in the East they endeavoured to confine the growth to the one island of Great Banda, and the trees in the other islands were systematically destroyed. These monopolising efforts were considerably hindered from the distribution effected by the fruit-pigeon (*Carpophage*). Indeed it was found necessary to send a commissioner every year to the different islands to uproot the trees sown by the agency of these birds. The N.-tree commences to bear in its ninth year, and lives to the age of about seventy-five. A good tree yields about 600 nuts yearly, or 8 lbs. weight. In Banda three crops are annually obtained. The fruit is gathered by means of a barb attached to a long stick; the mace is then separated from the nut, and cured by being pressed together, flattened on a board, and exposed to the sun for three or four days (the amount obtained averages 1 lb. to 430 nuts). The nut is smoke-dried for two months, or until the N. rattles in the shells. Previous to exportation these are cracked with a mallet and the N. extracted, or occasionally they are shipped just as cured. Being subject to the attacks of a beetle, the N. is often covered with dry lime, or soaked in a paste of lime and water, as a preventative, before it is shipped. Nutmegs are in large use as a spice, and medicinally as stimulants and carminatives; in large doses they have narcotic properties. They contain both a fixed and a volatile oil; the former is extracted by pressure and the latter by distillation. What are called American or Calabash nutmegs are obtained from *Momodora Myristica*; Brazilian nutmegs from *Cryptocarpa maschata*; Madagascar nutmegs from *Agathophyllum aromaticum*.

Medicinal Properties of N.—The kernel of the seed of the

Myristica officinalis is employed in medicine as an aromatic, stimulant, and carminative; but it is chiefly used to cover the taste of other medicines. N. is contained in *pulvis catechu compositus*, *pulvis creta aromaticus*, *spiritus armoracia compositus*, *tinctura lavandula composita*, and is administered in doses of from 1 to 5 grains.

Nutria. See COYPU.

Nutrition, the function of living beings in the exercise of which food is received, digested, and assimilated. It may be regarded as the function through which the 'individual' retains its place in the world, and makes good the loss of substance incessantly occasioned by the act of living. It differs from *Reproduction* (q. v.), the function that makes good losses which the 'species' or 'race' sustains through the death of its members. The physiology of N. concerns itself with the quality and nature of the food, and the consequent quality of the blood from which the nutritive functions derive their material; while the influence of the nervous system, the age, and constitution of the individual, and other conditions, such as heat, cold, &c., naturally affect the N. of the body as a whole. Impaired N. gives rise to diseased conditions, as also does excessive N. The necessity for N. arises from the fact that the body is continually losing substance in the form of its particles, while chemical action is also constantly wasting its matter. The essential end of the function of N. is that of supplying materials to the already formed parts of the body, so that these parts may develop new particles. The active seats of N. in the body would therefore appear to be the *nuclei* or *cytoblasts*—the minute solid particles—which are seen in all tissues. Thus in muscles, and especially in active and well developed organs, these nuclei are well seen; they are also abundant in the brain, and constitute the germinal or reproductive centres from which new substance is added to the muscular and nervous tissues. *Growth* follows as the result of perfect N. Growth may either consist in a maintenance of the equilibrium of the body, as, for example, where the repair of an organ simply counterbalances its waste; or in the accumulation of material from which new parts and structures are to be formed, or from which additions may be made to already formed parts. Thus, in early life, the living organism has to accumulate more material in proportion to its size than in adult life, since it requires a kind of nutritive deposit-account on which to draw for the increase of its parts; while in adult life, the body being in healthy equilibrium, the waste and repair are equal, and the process of N. simply serves the purpose already mentioned of maintaining this evenly-balanced state.

The N. of *Plants* is derived from various chemical elements, of which carbon, oxygen, hydrogen, nitrogen, and sulphur are absolutely necessary; and in addition to these, iron, calcium, potassium, magnesium, and phosphorus, are constituents of every healthy plant. In the lower orders of the vegetable kingdom the whole surface is the means by which the food is acquired, whilst in the higher the root is specially designed for this purpose, the leaves in addition being adapted for the absorption of nutrient material in a gaseous condition. It is only in a gaseous or fluid state that the elements can pass into the interior of the cells, and this is effected by means of *osmose* between the cell sap and the water absorbed by the plant. 'Carnivorous plants' appear to have the power of taking in nitrogenous pabulum through appendages to their leaves, or other peculiar contrivances. See **PLANT**, **SAP**, and **VEGETABLE PHYSIOLOGY**.

Nux Vomica, the specific name of a species of *Strychnos* (q. v.), is applied in a commercial and medicinal sense to its seeds, from which the powerful poisons known as Strychnine (q. v.) and brucine are obtained. It is a moderate-sized, straggling, branched tree, a native of India and Cochin-China. The small flowers are succeeded by a fruit of the size and appearance of an orange, but with a hard rind enclosing a mucilaginous pulp in which the flattened circular fruits are embedded. These have an intensely bitter taste. The bark, either through inadvertence or fraud, was at one time substituted for that of *Galipea cusparia*, and though through the fortunate investigation of Dr. O'Shaughnessy the dreadful mistake was soon detected, the name of 'false Angostura Bark' still holds. In India preparations of the wood, roots, and leaves, are used for snake bites, fevers, and rheumatism.

Nussur, or **Nussura'na** (*Nuss*), a term of Arabic origin, universally used throughout India for the present offered by the inferior to the superior, in accordance with Oriental custom ;

and also for the fine or relief paid by the son on succeeding to a hereditary office or property, such as a *jagheer*. Among Mohammedans it is specially applied to the fee for charitable donations paid at the great festivals.

Nyamtsa, a town in Rumania, capital of a district of the same name, lies on a hill 62 miles W. of Jassy. It has large yearly fairs, and a shrine of the Virgin which attracts numerous pilgrims. Pop. about 10,000.

Nyanuggur, or **Beawar**, the chief town of the district of Mairwarra in Rajputana, India, 31 miles S.W. of Nusseerabad. Pop. (1872) 9544. It was founded by Colonel Dixon in 1835, and is surrounded by a wall. N. has now become a considerable centre of trade in cotton and grain. There are two cotton presses, but the bales are usually laden unpressed on camels. The total export is valued at £200,000.

Nyanza ('the water'), a native name given in equatorial Africa to large sheets of water, as in the case of the great lakes Ukerewe and Mwtan, better known as the Victoria and Albert N. (q. v.).

Nyassa or **Nyanja** (a name identical seemingly with *Nyassa*), a lake in the interior of Africa, 350 miles from the coast of Mozambique, discovered by Dr. Livingstone in 1861. It lies 1575 feet above the sea, is 250 miles long from N. to S., and 50 broad, has an extreme depth of 100 fathoms, and is drained by the river Shiré into the Zambesi. The mountains which surround it have a height for one stretch of 100 miles of from 10,000 to 12,000 feet above the lake. Among the mountains Livingstone found a numerous population growing maize, cassava, tobacco, and English peas, which had been introduced by Arab traders. The lake itself is visited at a certain season by dense clouds of midges; these the natives gather and make into cakes. The waters are sweet, and well-stocked with fish. On a promontory at the S. end is the Scotch mission-station and trading-post of Livingstonia. In 1876 the mission launched a steamboat on the lake, which, unfortunately, has not a single navigable affluent. In his interesting account of the circumnavigation of the lake Capt. Young expresses his belief that there is a flow of water from the N. as well as from the S. end, and that the N. affluent is the Rovuma. See *N.*, a *Journal of Adventures*, by E. D. Young (Lond. 1877).

Nyāya (lit. 'entering into, analysis'), the name of one of the six great systems of Hindu philosophy, and also of the work in which it is contained, reputed to have been written by a legendary philosopher, Gotama. It is directly opposed to Sankhya (q. v.) = synthesis. It treats of the instruments, the methods, and the objects of right knowledge; and it is, in fact, a complete system of metaphysics based upon an analysis of the reasoning faculties. Its chief interest lies in the circumstance that it represents a theory of logic arrived at entirely independently of the logic of Aristotle, the basis of all European systems. The analysis of the syllogism and of other fundamental processes of reasoning has been highly praised. On the other hand the N. contains an innumerable series of rules for the conduct of verbal disputations; and it is this latter portion of its contents that has always been most studied and practised in India. At the present day the *pundits* of Nuddea (q. v.) enjoy the highest reputation as teachers of N., and about forty pupils also study it, under English professors, in the Sanskrit College at Benares. Like the rest of the early Hindu philosophical works, it is written in *sutras* or aphorisms, each of which has become the subject of many commentaries. The Sanskrit text was published at Calcutta in 1828. See also Colebrooke's *Miscellaneous Essays* (vol. 1. Lond. 1837), and *Hinduism*, by Professor Monier Williams (Lond. 1877).

Nyctagina'cea, or **Marvel of Peru Family**, consists of about 120 species of trees, shrubs, or herbs, with opposite or alternate leaves, flowers often enclosed by large leafy or coloured bracts,

Mirabilis jalapa.

and a bladder-like fruit. They are widely dispersed over the tropics, the pretty and fragrant *Abronia* extending to N.W. America. As a rule the medicinal properties are purgative—indeed at one time it was supposed that jalap was the root of *Mirabilis jalapa*. This species, under the name of Marvel of Peru, has long been cultivated in gardens, as also other handsome plants belonging to the same genus. The *Bougainvilleas* are also garden favourites on account of their gorgeous appearance from their large showy bracts; and various species of *Pisonia* and *Boerhavia* are in cultivation, but they have no particular beauty or interest to recommend them.

Nycteribia, a genus of Flies forming the type of a special family, *Nycteribidae*. They are popularly known as 'Bat-ticks,' although in no way related to the true Ticks (q. v.). They are spider-like insects, with a pointed head, and four simple eyes or ocelli—no compound eyes being found. The antennæ are two-jointed. The proboscis is feather-shaped, and the legs are long. The N. are very small, attaining an average length of only 2 or 3 lines. *N. Westwoodii* is a familiar species.

Nyiregyháza, a town in Hungary, in the comitat of Szabolcs, 32 miles N.N.E. of Debreczin by rail. It has large yearly fairs, and important manufactures of spirits, saltpetre, soda, and oil. Pop. (1870) 21,896.

Nyköping, a seaport on the Baltic coast of Sweden, the chief town in the län of Södermanland, at the mouth of the Nyköpings-na, 53 miles S.W. of Stockholm. It has 2 churches, 2 hospitals, and a high school. There is a considerable trade with the interior, and corn and timber are exported. Pop. 5016.

Nyl-Ghau, a species of *Antilopidae* or *Antelopes*, inhabiting forest lands in India and Persia, and attaining a height of 4 feet.

It is thus one of the largest of the antelope family. Scientifically named, the N.-G. is the *Portax picta* of zoologists. In general form it is not unlike the llamas included in the camel family. The horns, borne by the males alone, are simple in shape, of black colour, and are curved upwards and forwards. The neck is long, exhibits a prominence in front, and bears a short mane, while the breast has also a prominent tuft of hair. The back is 'humped' between the shoulders. The N.-G. is hunted both in India and Persia,

and from its fleetness gives sport of a very superior kind. Its colour is a blackish-brown.

Nymph, a term applied to the *chrysalis* or *pupa-stage* of insects. More frequently the term 'pupa' is employed to denote this stage, which in the perfect form of metamorphosis is marked by quiescence, the animal being enclosed in a pupa-case or cocoon. See METAMORPHOSIS.

Nymphaeaceæ, a natural order of aquatic dicotyledonous plants with shield-like or heart-shaped fleshy leaves proceeding from a rootstock that extends into the mud at the bottom of the water. The flowers are often large, with from three to five sepals, numerous petals, and an indehiscent many-celled fruit with numerous seeds. Three sub-orders are now included under N.—viz., *Nymphaeæ* or water-lilies, *Cabombææ* or water-bucklers, of which the curious, wide-ranging, and edible *Hydrophilus purpurea* is the representative; and the *Nelumboneæ* or water-beans. In all, there are about 40 species found through the temperate and tropical zones. The properties, so far as known, are unimportant, but several species supply articles of food, &c. See EURYALE, LOTUS, NELUMBO, VICTORIA, WATER-LILY.

Nymphaea alba.

Nymphææ, in classic mythology, a race of inferior female divinities, almost infinite in number, who may be divided into two main classes—the first consisting of embodiments of natural phenomena, the second of personifications of states and cities. To the former class belong the Oceanids of ocean, the Nereids of the sea, the mountain Oreads, freshwater Naiads, the Dryads and Hamadryads of the woods, &c. Among the N. associated with special localities were the Lemnæ, Nysiades, and Dodonides. Though always young and fair throughout their period of existence, the N. were not immortal, the life of a hamadryad ending with her tree. Their offerings usually consisted of goats, lambs, oil, and milk, never of wine.

Nynee Tal (*Nāini Tāl*), a hill station and sanitarium in the district of Kumaon, N.W. Provinces, British India, 22 miles S.W. of Almora, and connected by a good cart-road with the plains. N. is 6520 feet above the sea. Pop. more than 8000 in the hot weather. A church was erected by subscription in 1847; and during the troubles of 1857-58 many European families took refuge here. It is a favourite resort during the sultry months, and a sort of summer headquarters of the N.W. Provinces Government; it is also a sanitarium for the troops in Oude and Rohilcund.

Nyss'a. See TULEPO TREE.

Ny'stad, a small seaport of Finland, in the government of Abo, on the Gulf of Bothnia, 46 miles S. of Björneborg. In 1871 there were 41 vessels of 7550 tons belonging to the port. The exports are laths, wooden utensils, hosiery, &c. Pop. 3495. By the Treaty of N. (1721) Sweden ceded to Russia the Baltic provinces, Viborg, Keaholm, and numerous islands, August 30, 1721. On the 5th of July 1855, during the Crimean War, N. was bombarded by the English.

O.

the fifteenth letter of the English alphabet, and the fourth vowel, corresponding to the Semitic Ain. Its proper pronunciation is a long open sound, as in the interjection *oh!* but in many languages, and particularly in English, the pronunciation is very anomalous. In 'on,' 'one,' 'only,' and 'onion,' four distinct sounds are represented by this one vowel; and an additional anomaly is furnished by *oo* which in English has the pronunciation properly signified by the cognate vowel *u*. In Greek separate symbols were in use for short O (Omikron) and long O (Omega), the latter of which was only introduced late in the history of the alphabet, as implied by its position in the series. As a general rule O undergoes comparatively few changes in affiliated languages. Long O is represented by diphthongs, into the composition of which O enters: e.g., Lat. *ovum* = Fr. *œuf* and Ital. *uovo*; Lat. *totus* = Fr. *tout*. In Latin, as in French, O was not well distinguished from AU, as may be seen in the form of 'Clodius' for 'Claudius'; 'explosion' has the same root as 'applaud.' In Greek, especially in the Æolic and Doric dialects, O was similarly confused with *ou*, which diphthong in modern Greek is pronounced not as *ou* in 'how,' but as *oo* in 'boot': cf. Gk. *Mousa* = Lat. *Musa*.

As an abbreviation O stands for *optimus*, 'best,' as in the phrase common on inscriptions, D. O. M. = *Deo optimo maximo*.

O, a common prefix in Irish names, forms a patronymic, and answers accordingly to the Gael. *Mac*, the Cym. *Ap*, and the Norm. *Fils*. It is probably derived from the Erse *ua*, 'a grandson' (cf. Gael. *agha*, and Iow. Scotch *œ*), though some regard it as a mere corruption of the Eng. *of*.

Oahu. See HONOLULU and SANDWICH ISLANDS.

Oak (Old Eng.) is the name now given to the genus *Quercus*, a genus comprising about 300 species, widely distributed over the northern hemisphere, and found also in S. America, Mexico, Java, and New Guinea. Although the different kinds vary considerably in general appearance, the acorn seated in its cup provides a good distinguishing character for the whole. It would be difficult to name any group of trees that possess more general interest, whether considered with reference to their varied uses, their historical traditions and associations, or their great age, vast size, and their noble appearance. The British O. (*Q. Robur*), once the chief forest-tree of England, extends through the greater part of Europe and W. Asia, attaining a height of 120 feet, and a girth up to 70 feet (Cowthorpe, Yorkshire), or even 90 feet (France, *teste* Humboldt). There are two varieties, viz., *Q. pedunculata*, supplying most of the O. timber for shipbuilding, and preferred for joiners' work from the 'silver grain' being conspicuous, and *Q. sessiliflora* or *Durmast O.*, with a darker, heavier timber, more elastic and less easy to split. The last is the quickest grower, and lives on poorer soil. Its bark is also richer in medicinal, tanning, and dyeing properties. The following are the most important foreign species of O. *Q. Egilops*, native of S. Europe and Syria, a nearly evergreen tree; the acorns are eaten raw and boiled; the cups, known as *valonia*, are largely used for tanning and dyeing; the wood is capital for furniture. *Q. alba*, the white or Quebec O., a most valuable timber-tree, 100 feet high, and 7 feet in diameter; the wood largely used by shipbuilders, wheelwrights, coopers, &c. *Q. aquatica*, native of N. America, height 60 feet, furnishes a superior bark for tanning, also wood for shipbuilding. *Q. cerris*, the Turkey or mossy-

cupped O., native of S. Europe and W. Asia; a large tree, of more rapid growth than British O., but having wood of a similar structure; used by cabinetmakers, wheelwrights, turners, coopers. *Q. coccifera* or *Kermes O.*, a shrub or small tree of the Mediterranean region, supplies a tanning bark; a *coccus* which lives on this species furnishes a red dye, much employed before the introduction of cochineal, and still used in the East. *Q. coccinea*, the black O. of N. America, height 100 feet, has a bark rich in tannic acid; the yellow dye known as *quercitron* comes from this tree. *Q. densiflora*, the Californian chestnut O., a large evergreen tree of beautiful outline, dense foliage, and compact growth, has a bark very valuable for tanning. *Q. falcata* of N. America, a tree attaining 80 feet in dry, sandy ground, produces an excellent tanner's bark, and galls for superior ink. *Q. Garryana* of N.W. America, a gigantic tree; its timber is remarkably pale, but hard and fine-grained, of great strength and durability; the acorns are an excellent meat for hogs. *Q. ilex*, the holm or holly O., of wide distribution through S. Europe, Algeria, and eastwards to the Himalayas; a tree of about 50 feet; the wood is close-grained, very heavy and hard, and takes a fine polish; the bark is used for tanning; the acorns of a variety named *Q. Ballota* form an important article of food in Spain and Algeria. The tree was introduced into England in 1581, and is often planted, being the largest and handsomest of evergreen trees suited to the climate. *Q. infectoria*, the gall or dyer's O., a shrub or middle-sized tree of the Mediterranean region, with cylindrical acorns, the leaves grey underneath; yields the galls used in medicine and dyeing. *Q. lyrata*, the overcup O. of N. America, a majestic tree, is recommended as one of the most valuable for timber cultivation. *Q. Mongolica*, native of Manchuria; it is on this tree and on *Q. serrata* that the silk insect peculiar to O. trees is reared. *Q. Phellos*, the willow O. of the United States; its acorns are available for food. *Q. Prinus*, the N. American swamp O., a large tree growing in wet ground; the wood is strong, elastic, and of fine grain; the bark yields a red dye. *Q. rubra*, the red O. of N. America, 100 feet high; the wood is poor, but the bark is rich in tannin; its acorns form useful hog food. *Q. Sideroxylon*, a native of the mountains of Mexico, grows to a large size; its timber is compact and almost imperishable in water. *Q. Skinneri*, also Mexican; the acorns measure nearly six inches in girth, and are available for various domestic animals. *Q. stellata*, the post O. of N. America; not a large tree, but has very durable and dense wood, and is in much requisition for posts, and highly prized for shipbuilding. *Q. Suber*, the cork O. of Mediterranean regions and Algeria, attains a very large size in Andalusia, and is hardy in England; it is an evergreen, long-lived tree, yielding the bulk of the cork of commerce; after about twenty years of age it can be stripped of its bark every six or seven years. The allied *Q. occidentalis* yields a superior cork, harder than the above. *Q. Tosa*, native of S. Europe, is a small but handsome tree, with young shoots silvery white; it forms vigorous coppice-woods on sandy soil, and furnishes an excellent bark for tanning; the wood is mainly used for fuel. *Q. virens*, the live O. of N. America, is an evergreen tree of about 50 feet; its timber is heavy, compact, fine-grained, and most valuable for shipbuilding; it can live on seashores, and is the strongest and most durable of all American oaks.

Medicinal Properties of the O.—The dried bark of the small branches and young stems of the *Quercus pedunculata* is collected for medicinal purposes, in spring, from trees growing in Britain. O.-bark is a valuable astringent, and is administered generally, or topically, in such cases as tenderness of the gums, leucorrhœa, prolapsus, &c. For internal use, the powder may be given in doses of from 30 to 120 grains; and the decoction, in from 1 to 2 oz. two or three times daily.

The word O. by British colonists has been applied to trees that botanically have no claim to it, thus Botany Bay O. is a species of *Casuarina*, and New Zealand O. is *Alectryon excelsum*. African O. used in shipbuilding is *Oldfieldia Africana*. The poison O. of N. W. America is *Rhus Toxicodendron*. See BARK, CORN, GALLS, ILEX, QUERCITRON, TANNING, VALONIA.

Oak Beauty (*Biston prodromaria*), a species of brown moths found in the S. of England. The front wings are marked on their upper surface with two dark curved bands; the hinder wings have only one band. The larvæ feed on oak leaves.

Oakeley, Sir Herbert Stanley, Mus. Dr., second son of the late Very Rev. Sir Herbert Oakeley, Bart., was born July 22, 1830, and educated at Rugby and Christ Church, Oxford, taking the degree of M. A. in 1853. He was appointed Professor of Music in the University of Edinburgh in 1865, and his services in that capacity include the institution of the annual Edinburgh Orchestral Festivals conducted by Mr. Charles Halle, and the formation of a musical society among the students. On the occasion of the unveiling of the Scottish National Memorial to the Prince Consort in Edinburgh in August 1876, when he conducted the musical arrangements, he received the honour of knighthood. Sir Herbert, who is an accomplished organist, has composed a large number of songs, part songs, quartetts, and anthems, &c., of considerable merit.

Oakham (Old Eng. 'Oak-Dwelling'), the county town of Rutlandshire, England, 25 miles N.W. of Peterborough, is connected with the Midland Railway by the Syston and Peterborough branch. It possesses a grammar school, founded in 1581, and a church with a fine tower and spire, the interior of which was restored in 1858 at a cost of £6000. Brewing and malting are carried on, and the knitting of hosiery engages a considerable number of females. Pop. (1871) 2911.

Oakland, a town in California, U.S., 6 miles from San Francisco, with which it is connected by rail and steamboat, is the terminus of the Central Pacific Railway. It has marble and iron works, a cordage and jute factory, flour and planing mills, and potteries, 17 churches, 2 libraries of 6000 volumes, and 4 daily newspapers. Pop. (1870) 11,104.

Oak Leaf Roller (*Tortrix viridana*), a well-known species of moth belonging to the *Torticidae* or 'Leaf Rollers.' It is one of the most brightly-coloured members of its family, and is of a prevailing brown hue, but the front wings are a bright green. It feeds on oak leaves, and does immense damage to these trees.

Oak'um (Old Eng. *acumba*, 'what is combed'?), the separated fibres of old hempen rope, chiefly used with pitch in caulking ships. The work of teasing O. constitutes in gaols one of the light punishments inflicted on criminal prisoners.

Oann'es was a Babylonian deity, who, according to the account of Berosus (q. v.), as quoted by Appollodorus and Alexander Polyhistor, appeared from the Erythraean Sea in the first year (of the existence of Babylon). His form was that of a fish with the head and feet of a man subjoined to the head and tail of the fish respectively. This being passed the day among men, teaching them letters, arts, and sciences, such as architecture, legislation, geometry, agriculture—in short, all the arts of civilisation; but at sunset he retired to the sea, and passed the night in the deep. Figures answering the description of Berosus have been discovered on the Babylonian and Assyrian sculptures, and it has been supposed that O. is the Hea of the Babylonian Theogony, who is the God of the Sea and of Hades, Lord of generation, and of all human beings, of wisdom, of mines and treasures, of gifts, of music, of sailors and of fishermen, corresponding in some respects to Saturn (q. v.) or Cronos, and in others to Neptune (q. v.) or Poseidon. See Smith's *Chaldean Account of Genesis* (Lond. 1876).

Oar (Old Eng. *dr*, 'that which ploughs the water,' from *crian*, to plough; comp. Lat. *arare*), an implement of wood for propelling boats. It consists of a pole forming the *handle*, *loom*, and *shank*, and expanding at the end into a wide flat *blade*, which is dipped into the water. A *button* or projecting piece of leather, placed on the underside where the loom merges in the shank, serves to keep the O. in proper position between the rowlocks by pressing against the one nearest the oarsman. To

feather the oars is to bring the blade after the stroke into a horizontal position so that it offers least resistance to the air; this is done by turning the 'O. round till the button be on the underside. In rowing, the foremost O. is called the *bow* O. and the aftermost the *stroke* O.

Oases (Coptic *ouah*, 'dwelling'), fertile and habitable places in the desert, usually under the general elevation, yielding water and dates. They are formed and rendered capable of cultivation by water flowing subterraneously, or forming small lakes and rivers, which, by means of canals, water the fields and gardens of the inhabitants. The O. of the desert of Libya have warm springs, the temperature of which Rohlfs in 1874 ascertained to be, at Farafrey, 79° F.; in Dakhel, from 92° to 99° F.; and in Siwah, the famous oasis of Jupiter Ammon, from 82° 4' to 84° 4' F. Several O. have brackish water, containing strong salt in solution, and are uninhabited, as also some of the smaller ones, which, however, are used by the caravans as night stations. The larger O. usually consist of a series of smaller ones, connected with one another by tracts of steppe-like country. In ancient times O. were of much more commercial and even political importance than now, as the remains of temples point out. They are first mentioned by Herodotus, and the visit of Alexander the Great to the temple of Jupiter Ammon in the oasis of Siwah was an event which was much celebrated in the ancient world. The chief O. of the Sahara are those of Tafilet, Tâat, and Wargla in the W.; Fessan, with Murzuk, and Audkhila in the centre; Siwah, Farafrey, and Dakhel in the E.; and Tibesti, Bilma, and Air in the S.

Oat or **Oats** (Old Eng. *ata*, from *etan*, 'to eat') properly signifies any kind of food, but is specially applied to all the species of the genus *Avena*. These number about 40, occurring in temperate and cold regions. The genus is distinguished by the somewhat membranaceous glumes enclosing two or three florets, the outer palea of which are furnished with a long, bent, and twisted awn. The native country of the Common O. (*A. sativa*) is unknown, and as usual, in such cases, Central Asia is surmised. It would appear, however, from experiments undertaken by Professor Buckman and others, that it is an improved form derived by a continued and selective cultivation from what is called the Wild O. (*A. fatua*)—a plant of Europe, N. Africa, Siberia, Japan, and N. W. India. It was known to the Greeks and Romans, but is not one of the grains mentioned in the Bible. Although it can be grown under a wider range of climatal differences than wheat, it has not so high a boreal zone as barley, but is extensively cultivated throughout the whole of Northern Europe, and in Britain is produced to a greater extent, and of a better quality in Scotland than in England. A recent return for the United Kingdom gives the area devoted to O. as 4,238,957 acres, as against 3,321,065 under wheat. Though chiefly grown as food for horses, there are two forms in which it is largely used for human food—these are oatcake and oatmeal porridge. See OATMEAL. Import into the United Kingdom 1876 was 11,205,588 cwt., of value £4,619,427. The bristle-pointed O. (*A. strigosa*), a smaller and more slender plant than the above, was formerly much grown in Scotland, and is still occasionally seen as an introduction or remnant of cultivation. It continues to be grown in other countries where the soil is poor. The following are British species of the genus *Avena*:—Meadow O.-grass (*A. pratensis*), a plant of moors and dry pastures. It yields a sweet fodder. Yellowish O.-grass (*A. flavescens*) is one of the best perennial meadow-grasses for a dry soil, especially if intermixed with other species. It furnishes a considerable bulk of fine foliage, eagerly sought by sheep. This species has a wide distribution, nearly the same as *A. fatua* above mentioned. Downy O.-grass (*A. pubescens*), met with in dry pastures, especially in limestone and chalk, is a nutritious and prolific fodder plant. *A. elatior* or False O.-grass, from its widely creeping propensities comes into the category of troublesome weeds; it yields an abundant herbage, but is not relished by cattle or sheep. Other species of O.-grasses, of which the relative value as fodder produce is not yet known, are peculiar to N. America and other parts of the globe. A curiosity in the genus is the animal O. (*A. sterilis*) of S. Europe. The seeds, when ripe and fallen, move about on the ground in a manner simulating animal life, caused by the torsion of their awns altering according to the varying conditions of the atmosphere. Water O. is an American name for *Zizania aquatica*, a grass belonging to the rice tribe.

Oates, Titus, 'the thrice renegade son of a twice renegade father,' born about 1619, was the son of a parson of the Church of England, who had originally been a ribbon-weaver and then an Anabaptist preacher. O. became chaplain to the Duke of Norfolk, and afterwards a navy chaplain. From both posts he was expelled with disgrace, and also from the Jesuit Colleges of Valladolid and St. Omer, where he had pretended to be a convert to Catholicism. He then returned to England, and in 1678 communicated to the Government his abominable 'Popish Plot.' The Pope, Innocent XI., he said, had assumed the sovereignty of Britain in consequence of its heresy; had appointed Oliva, the general of the Jesuit Order, as Deputy-Governor, and issued new appointments to all the offices in Church and State. Arundel was to be Chancellor, with Powis, Bellasis, Stafford, Godolphin, and Coleman under him; Wakeman, the queen's physician, was to poison the king; and London was to be burned by a general rising of Catholics. The story was believed, for, though O.'s statements were inconsistent and obviously false, the nation had become uneasy about the Duke of York's Catholicism, and the impression was deepened by the murder of Godfrey, the magistrate who took O.'s declaration, and by the discovery of a treasonable correspondence between Coleman and Père la Chaise, which, however, had no resemblance to the 'Popish Plot.' By the aid of hired perjurers, such as Tonge (author of the *Index to Jesuits' Morals*), who entered into an agreement with O. to write up the plot), Kirkby the chemist, Carstairs, and Bedloe, and of the unscrupulous C. J. Scroggs, O. denounced and procured the conviction of many Catholics, including Coleman and Lord Stafford. Shaftesbury took advantage of the popular panic to pass a bill excluding from Parliament all Catholics, with the exception of the Duke of York and his family; and the movement had one good effect in incidentally revealing the treachery of the king and Danby in selling the national honour to France. O. was now called the 'saviour of the nation,' and received a pension of £1200. In 1685 his villany was discovered; he was convicted of perjury, pilloried, whipped from Aldgate to Tyburn (1700 strokes), and thrown into prison for life. As the cartoons of the time said, it was right to make his back blush, as his face could not blush. The only illegal part of this sentence was 'the stripping of the canonical habits.' In the trial Jeffreys made the celebrated ruling against O.'s accomplice, Smith, that the evidence of a man to prove an act of perjury previously committed by himself could not be received. On the Revolution he was liberated and received another pension. He died July 23, 1705, some ardent Protestants believing in him to the last. See Macaulay's *History of England*, also Howell's *State Trials* (vol. x.).

Oath, in Law, is a declaration accompanied by certain formalities which the law requires a person to emit before filling some public office, or previous to giving evidence before a court of justice. The highest office of the State, that of the Sovereign of the United Kingdom, requires the Coronation Oath (q. v.). With regard to the oaths to be taken by officers of the State, see **ABJURATION**, **OATH OF**. Members of certain religious sects objecting to the usual forms of oath are allowed to substitute Affirmation (q. v.). Under 6 Will. IV. c. 62, justices of the peace are prohibited from administering oaths unless they are specially prescribed or sanctioned by law. The object of this statute was to stop creditors from gaining moral preferences over one another, as was not unfrequently done by some one of them requiring the common debtor to take an oath in his favour. The usual mode of administering an oath in England in Court is for the officer of the Court to repeat the words of it, after which the witness intimates assent by touching the Gospels with his lips. In Scotland, the judge and witness stand, each raising his right hand, the latter repeating after the former the words:—'I swear by Almighty God, as I shall answer to God at the great day of judgment, to tell the truth, the whole truth, and nothing but the truth.' The judicial oath of England and of Scotland, if conscientiously taken, of course indicates certain religious belief or conviction on the part of the witness. The Jew is sworn on the Pentateuch to tell the truth as he believes in Jehovah. The Mohammedan is sworn on the Koran by his belief in Allah. Some legal difficulty is found should the witness openly profess atheism, pantheism, or polytheism, as it is held essential that a witness should believe in the existence of one supreme moral ruler of the universe, who will after death resuscitate all mankind, and re-

ward or punish each individual according to the morality of his actions. On the other hand, to reject the evidence of a witness because he does not believe this, nor feel fully convinced of its truth, would necessitate rejection of the testimony of some of the most eminent and conscientious men of our day; and otherwise be quite inconsistent with the ends of justice. It would probably be sufficient in order to extract the truth from a witness, to rely solely upon the penalties which the law justly attaches to the crimes of Perjury and Subornation (q. v.)—just as we rely on the penalties of the law alone to protect us against forgery or any other crime.

Oath, Religious, is an appeal to the Deity, or to anything sacred, in attestation of an assertion or in confirmation of a promise given or a duty undertaken. The use of oaths seems to have been common among most ancient nations. According to the Greeks, the gods themselves swore by the Stygian lake; and they themselves swore chiefly by Jupiter, who specially presided over oaths, but also on various occasions by all the other gods, by natural objects, by various persons, by the dead and the living, by the members of their bodies, &c. The O. was accompanied by various ceremonies, such as pointing to heaven, laying the hand on the altar, &c. Among the Hebrews the use of oaths was very common, both in public transactions and private intercourse; e.g., when agreements were made for the performance of certain acts (Gen. xiv. 22, xxiv. 2-4, xxxi. 53, l. 5, 25; Josh. vi. 26; 2 Kings xi. 4), when allegiance to God, fealty to a sovereign, or obedience to a superior was professed (2 Kings xi. 17; 1 Chron. xi. 3, xxix. 24). Judicial oaths were demanded by the Mosaic law on four occasions: (1) From a person with whom goods had been deposited and lost (Ex. xxii. 10, 11); (2) from one suspected of having lost property in his possession (Lev. vi. 3); (3) from a wife suspected of adultery (Num. v. 12-28); (4) from a whole community for the discovery of a theft (Lev. v. 1; Judg. xvii. 2; Prov. xxix. 24). The form of the O. was generally an imprecation by God or Jehovah, but also by heaven, the earth, the sun, Jerusalem, the temple, the angels, or distinguished persons (1 Sam. i. 26, xvii. 55; cf. Gen. xlii. 15). The ceremonies observed in connection with an O. were such as sacrificing seven animals (the Heb. verb to swear is literally to *seven*, cf. Gen. xxi. 23-31), calling seven witnesses, pointing to heaven (Gen. xiv. 22; Deut. xxxii. 40), putting the hand under the thigh (Gen. xxiv. 2, xlvii. 29), which is a euphemism for taking hold of the genital organs, a part of the body always considered sacred, as appears from phallic worship and circumcision. One of the most solemn rites was when two parties making an agreement cut one or more animals in halves and passed between the pieces laid opposite each other, implying an imprecation that the fate of the divided animals might befall the one who should break the agreement (Gen. xv. 9; Jer. xxxiv. 18, 19). See Smith's *Dict. of the Bible* (1863); Kitto's *Cyclo. of Bib. Lit.* (new ed. Edinb. 1866); Spencer's *De Legibus Hebr.* (Hagæ, 1686); Potter's *Ants. of Greece* (4th ed. 1722).

Oatmeal. For the preparation of O. the oats are first kiln-dried and submitted to a process of milling by which the husks are removed, leaving the grain in the condition of groats or grits. These subsequently ground to a more or less coarse meal constitute ordinary or Scotch O. O. made into Porridge (q. v.) or baked into cakes formerly constituted the staple food of the Scotch peasantry and working classes, and considering that it formed at once an eminently wholesome, nutritious, and economical diet, it is a matter for great regret that the substance is now more looked on as a luxury for the wealthy than as the staple food of the poor. As compared with wheaten flour, O. contains much larger proportions of albuminoid or nitrogenous matter, fat and mineral matter, but less starch and water. The following shows the average composition of 1 lb. of good Scotch O.:—Water, 350 grs.; fibrin, &c., 2 oz. 252 grs.; starch, &c., 10 oz. 352 grs.; fat, 1 oz. 269 grs.; cellulose, 259 grs.; mineral matter, 147 grs.

Oaxaca (pron. *Oahaca*), one of the S. states of the Mexican confederation, lies S.W. of the Isthmus of Tehuantepec, bounded S. by the Pacific, E. by Chiapas, N. by Vera Cruz, and W. by Puebla and Guerrero. Area 35,591 sq. miles; pop. (1875) 648,779. The surface is covered in the E. with offsets from the mountains of Chiapas, and in the W. is a high plateau, rising in the Cerro ('mount') de Zempualtepec to 11,483 feet, and broken by deep valleys, from which the Rio Verde flows to the Pacific

and the Rio Alvarado to the Atlantic. The climate is mild and healthy except in the plains near the coast. Violent earthquakes are frequent. The soil of O. yields abundant maize, rice, sugar, coffee, and indigo, and there is rich mineral wealth still unwrought.—O., the capital of the State, is situated in a fertile valley of the river Atoiac 4967 feet above the sea, and 185 miles S.S.W. of Vera Cruz. It is the seat of a bishop and of a university, and has manufactures of cigars and chocolate, but the chief industry is the raising of cochineal. O. was founded in 1528 on the site of the ancient capital of the Zapotecs, and has large ruins of palaces and temples. Pop. 25,000.

Ob, or **O'bi**, the principal river of Western Siberia, is formed by the confluence of the Bia and Katunga, which rise in the Altai Mountains, the former in Lake Toleskoi ('gold lake'), the latter at Mount Belucha, and unite 8 miles below Biisk. Following a general north-westerly course, the O. receives on the right the Tom, Chulim, and Kat, and on the left the Charish, Irtysh and Konda; and after a course of some 2600 miles flows into the Gulf of O., an inlet of the Arctic Ocean. It passes the towns of Barnaul, Narim, Surgut, Beresov, and Obdorsk; and drains an area of 1,300,000 sq. miles. Owing to the slight fall of the stream—4 feet in 12 miles—it readily overflows its banks; and it is frozen over for half the year. Steamboats, however, have for some years been established on its waters. In the spring of 1876 an expedition was despatched from Bremen by the German Polar Society to explore the territory of the O., and in the same year, the English steamer *Louise*, despatched by M. Trapeznikoff, a Moscow merchant, ascended the O. and Irtysh to Tobolsk, a distance by river of more than 1000 miles.

Obadi'ah (Heb. 'servant of Jehovah') is the name of the fourth of the Hebrew 'minor' prophets, whose 'vision' is directed against the Edomites for their malice and perfidy when Jerusalem was destroyed. If this was the destruction by Nebuchadnezzar (B.C. 588), as seems most probable, then O. wrote some time during the Babylonian captivity.

O'ban (Gael. 'the little bay'), a town of Argyllshire, Scotland, on a bay of the same name, which forms an excellent harbour, being of great depth, and protected by the island of Kerrera in front, and the elevated shores of the mainland behind. Though of recent origin, O. has become a great rendezvous for tourists, and is sometimes called the 'Queen of the Western Highlands.' It contains several superb hotels, and a court-house, while on the heights above the town numerous villas have been erected. To the N. are the interesting ruins of Dunolly Castle, and three miles N. is Dunstaffnage Castle, which preceded Scone as the seat of the Scottish Kings. O. belongs to the Ayr group of burghs. Pop. (1871) 2426.

O'beah, a species of magic practised by the W. African races, and from them transferred to the negroes of the United States and W. Indies. It is a development of Fetichism (q. v.), being based on a supposed connection between living beings and inanimate objects. Spells, philtres, and waxen images, form, as in witchcraft, the chief instruments of the O. man or woman. The superstition still lingers on in the W. Indies; and cases have recently occurred of negro Methodists of high standing being suddenly smitten with the O. frenzy and abandoning themselves to the most revolting rites. See Bryan Edwards' *History of the British Colonies in the W. Indies* (1793), and E. Tylor's *Primitive Culture* (1871).

Ob'elisk (Gr. *obeliskos*, dim. of *obelos*, 'a skewer or spit'), a lofty four-sided monolithic pillar diminishing in width from the base upwards, and terminating in a low pyramid called a *pyramidium*. The height is invariably about nine or ten times the thickness of the lower extremity of the shaft, and this thickness, compared with that of the upper extremity directly under the pyramid, is usually in the ratio of 8 to 5. Egypt is peculiarly the land of obelisks, which were mostly formed of blocks of rose-coloured granite, quarried at Syene and thence transported to different cities at a marvellous expenditure of manual power. The monoliths were polished, usually covered with hieroglyphics, and raised on pedestals in the form of a cube, or, in early instances, truncated pyramids. The apices were sometimes capped with gold or finished with metal terminals. The true significance of the Egyptian O., which was called *tekhens* (root 'to hide'), is obscure beyond the fact that it was a symbol of the sun and an emblem of the god Amen or Amun, whose name signifies the 'un-

revealed.' During the 12th dynasty great obelisks were placed at the sides of the pylons or gates of a temple; and during the 19th and later dynasties they were erected as triumphal monuments. In earlier periods an O. of diminutive size was commonly raised at the tomb of a king; some of these small obelisks are to be met with in European museums. Many of the great Egyptian obelisks have likewise been transported to different continental cities, where they adorn the public places. Rome possesses twelve which owe their removal to the cupidity of Roman emperors. Five of these are of historical importance:—(1) the Lateran O. (105 feet high without base), taken from Heliopolis to Alexandria by Constantine, and thence removed by his son to Rome and erected in the Circus Maximus; it fell and broke, and in 1588 was raised in its present site in the Piazza del Laterano by Pope Sixtus V. (2) An O. of Rameses II. (height 78 feet), erected by Augustus in the Circus Maximus, and transferred to the Piazza del Popolo in 1589, where it now stands as the Flaminian O. (3) O. (height 72 feet) of Psammetichus II. (B.C. 594), set up by Augustus in the Campus Martius as a gnomon, and removed to the Piazza di Monte Citorio by Pope Pius VI. in 1792. (4) O. (height 82 feet) placed in front of St. Peter's about 1590 by Fontana. It was brought to Rome by Caligula and placed in his circus on the Vatican. It is said to have been originally erected at Heliopolis by Menephtah, son of Rameses II., but its Egyptian origin has been questioned, as it is destitute of hieroglyphics. (5) O. (height 55 feet) placed by Domitian in the Circus Maxentius, and removed in 1651 by Innocent X. to the Piazza Navona, its present position. Egyptian obelisks are also to be seen at Constantinople, Florence, and in France, at Paris and Arles. The Parisian O. (height 76½ feet) was removed in 1831 from the temple of Luxor and erected in the Place de la Concorde in 1836. The cost of its removal has been variously stated at from £30,000 to £80,000. London, too, is now in a position to boast of its Egyptian O., since one of those popularly called 'Cleopatra's Needles' was in 1877 removed from Alexandria for erection in the British metropolis. The history of this O. is interesting. The Egyptian city An, or Heliopolis (Biblical On) was called *ben-ben-ha*, 'house of obelisks,' and around its temple of the sun six obelisks originally stood; two were raised by Osertesen I. (12th dynasty), and the others by Thothmes III. (19th dynasty) and his successors. Only one O., a shaft of Osertesen, and probably the oldest great O. in the world, now keeps guard over the ruins of the ancient city. Its neighbour shaft has disappeared and probably lies buried in the sands. Of the remaining four obelisks, one is at Rome, another at Constantinople, and two are celebrated as 'Cleopatra's Needles,' which were transported to Alexandria and raised in front of the Water Gate of the Cæsarium in the eighth year (Alexandrian era) of the reign of Augustus, B.C. 23, exactly 1900 years ago. Cleopatra was then dead a few years, but she may have directed their removal before her death. In 1801, one of these Needles lay prostrate, half embedded in the sands, and its removal to England was contemplated by the British forces in Egypt after the disastrous defeat of the French. The companion O. is still erect at Alexandria, but it is reported to have been acquired for the city of New York. In 1820 the fallen O. was formally presented to Britain by Mehemet Ali, and the gift was renewed in 1867 by the present Khedive of Egypt. The Government, however, regarded the venerable monument as unworthy of removal, and it lay on the shore of Alexandria till 1877, when, through the enterprise and munificence of a private citizen—Mr. Erasmus Wilson—it was secured for erection in London. The removal of the O. was successfully accomplished by firmly securing it inside of an iron cylinder, which was built round the O. where it lay, and then rolling the whole down to the sea. The cylindrical vessel, rigged with sails and fitted with steering gear, and called the 'Cleopatra,' was taken in tow by a merchant vessel and brought safely as far as the Bay of Biscay. Here the 'Cleopatra' was cast adrift during a severe storm. In the first attempt to transfer her crew to the merchantman six lives were unhappily sacrificed. The 'Cleopatra,' contrary to expectation, rode safely through the storm, and two days afterwards was sighted by a ship and taken to Ferrol, where she remained till January 1878, when she was brought to London, arriving in the East India Dock, Blackwall, on the 21st of that month. It consists of syenite, and has a total length of 68 feet 5½ inches, 7 feet 6 inches being contributed by the pyra-

midion. The O. is not square at the base, but measures 7 feet 10½ inches by 7 feet 5 inches. The weight is estimated at 186 tons, and the cubical measurement at 2529 cubic feet. Three vertical lines of hieroglyphics are inscribed on each of the four sides. The central line on one side shows that this singularly interesting monolith was originally set up by Thothmes III. as one of 'two great obelisks capped with gold' dedicated 'to his father Haremakhui,' (the sun in the horizon). The lateral lines of hieroglyphics were added by Rameses II. (the Sesostris of the Greeks). Birch's *Notes on Obelisks in the Museum of Classical Antiquities* (vol. ii, 1862); Figeac's *L'Obélisque de Lougcor* (Par. 1833); Cowper's *History of Egyptian Obelisks* (Lond. 1877); and Erasmus Wilson's *Cleopatra's Needle* (Lond. 1877).

Obelisk (+) in printing, a mark of reference to a note. It was originally employed in Roman Catholic Church books to guide the priest where to make the sign of the cross.

O'ber-Amm'ergau, a village of Upper Bavaria, 34 miles by road S. of Weilheim, which is 31 miles S.S.W. of Munich by rail. The inhabitants (1198 in 1871) are excellent carvers in wood and ivory, but O.-A. is chiefly celebrated for the decennial *Passion Play* performed by more than 400 actors. A permanent theatre, recently erected, accommodates 6000 spectators. The play was instituted in 1634 in accordance with a vow of gratitude for the cessation of a pestilence. It comprises the entire narrative of the Passion, interspersed with Old Testament tableaux, and lasts from seven to eight hours. The performance of 1870, interrupted by the Franco-German war, was repeated in 1871, and the next will take place in 1880. See Dr. Molloy's *Passion Play at O.-A. in 1871* (3d. ed. Lond. 1877).

O'berlin, Johann Friedrich, a famous Christian philanthropist, was born at Strassburg 31st August 1740, educated at the university there, and in 1767 accepted the charge of the parish of Waldbach in Steinthal, a mountainous district of Elsass. Here, until his death, 1st June 1826, with the utmost zeal, and with a success which excited the wonder of his contemporaries, he laboured to improve the resources of his parish and to educate his people. His supervision was of the most wide-reaching character, extending even to the most insignificant events in the lives of all his parishioners. He introduced better methods and implements of agriculture, and under his care his parish quadrupled its inhabitants and reached a high degree of cultivation. See Sims' *Brief Memorials of O.* (Lond. 1830), *Memorials of O., with a Short Notice of Louise Schepler* (Lond. 1838-52). There are numerous biographies of O. in French and German, of which the latest is that of Spach (Par. 1866).—**Jeremiah Jakob O.**, brother of the preceding (born 1735, died 1806), became a professor of classical philology in the University of Strassburg, and wrote some interesting works.

Oberlin College was founded in 1833 at Oberlin, a village in Ohio, U.S., 35 miles S.S.W. of Cleveland. It was designed for the liberal education of both sexes, a special feature being that the students support themselves by manual labour. There are departments of theology (under Congregational control), of philosophy, the arts, literature, and music, besides preparatory classical and English schools. The library contains 11,000 volumes. In 1875 the total income of O. C. was \$20,603; the faculty consisted of a president, 12 professors, 3 principals, and 14 lecturers, and the number of students was 475.

O'beron (Fr. *Auberon*, *Alberon*; from Ger. *Alberich*, old Ger. *alb*, 'elf,' or 'fairy' and *rich*; comp. Old Eng. *rica*, 'a king'), king of the fairies and husband of Titania, appears first in the French poem of the 13th c. *Huon de Bordeaux*. A quarrel between O. and Titania and their subsequent reconciliation through Huon, a French noble, and Amanda, daughter of the Sultan of Babylon, whom the former leads home by the help of O. after much difficulty, form the basis of this tale, which was reissued as a prose romance at Paris in 1516. It is from this source rather than from the older poem, that Chaucer, Spenser, and Wieland especially, have borrowed their conceptions of O. Some extracts from it were published by Comte Fressan in his *Bibliothèque Universelle des Romans* (1778), while the old *chanson de geste* was published in 1860 by MM. Guesard and Grandmaison in their collection of *Anciens Poëtes de France*. Shakespeare has introduced O. in his *A Midsummer*

Night's Dream, and Wieland has made O. the subject of a romantic epic first published in 1780.

Obesity or **Corpulence** is the term used to denote 'all those anomalous conditions of physical configuration which have as their prominent outward mark an excessive development of the subcutaneous layer of fat as well as a corresponding unshapeliness of the figure.' The morbid tendency to O. may be developed in the fatty tissues all over the body, as well as in certain limited portions of the *tela adiposa*, and the anatomical changes may be regarded as the expression of a general morbid condition, or as the localisation of a constitutional affection. Morbid O. depends, in great measure, on a general lesion of the function of nutrition, the fat-store, or fat laid up in the fatty tissues being markedly dependent both on the amount of food and the assimilation thereof. It is of importance to ascertain the kind of food from which fat is chiefly derived; and 'recent physiology regards the greater portion of the fat-store as probably a product of the decomposition of the *albumen of the pabulum*, just as the fat which occurs in degenerative processes is a product of the decomposition of the *organised albumen*.'

The results of the most recent investigations may be stated as follows:—The fat-store of the animal body is renovated and increased from the albumenates and homologous fat of the food supplied; the remaining constituents of which (heterologous fats, hydrocarbons, glutens) have mainly a conservative action upon the fat already formed, but are not directly lypogenetic. The conditions for the accumulation of fat are most favourable when the quantity of the fat-forming and conservative, or indirectly fat-forming elements of the diet is greatest; when the quantity of oxygen in the blood is least; and when the trophic and plastic energy of the tissues that absorb albumen is smallest.

It is a well-known fact that under identical dietetic conditions, and external circumstances, certain individuals remain thin, while others become fat, even to a morbid degree; so that the tendency to O. is obviously in great measure constitutional, and in many cases hereditary, or at least congenital. The periods of life specially favourable to O. are the first year and above forty, the tendency being greatest in the female sex. The extent to which fat may accumulate in the body is enormous. The normal weight of a man, six feet high, should not exceed 178 lbs., but Daniel Lambert, who died at the age of forty, weighed 739 lbs.

In addition to congenital disposition the following may be mentioned as frequent causes of O.:—(1.) Intemperance in diet and the use of spirituous liquors. Fat meats, butter, oily vegetable substances, milk, saccharine, and farinaceous substances are the most fattening articles of food. The vegetarian races of India have a marked tendency to O. The copious use of alcohol, especially in a concentrated form, is a frequent source of O., as the alcohol greedily absorbs oxygen, and hinders the combustion of the stored up fat. (2.) The influence of local activity. Increased muscular action lessens the tendency to the production of fat, and favours the production of flesh; bodily rest, on the contrary, favours fat production by antagonising the production of flesh. A combination of these predisposing causes invariably results in O., and the principles are so well understood that even amongst savage African races, where O. is much admired among females, the condition is intentionally induced, and frequently to such an extent that the female beauty is unable to assume or to maintain the upright position. (3.) There are certain morbid processes, calculated to produce O. symptomatically and as a sequela, such as chlorosis, morbus Addisonii, &c. There is a form of physiological anæmia, which predisposes to O., though sluggish blood formation, or relaxed constitution, is not invariably followed by O.

Treatment.—The prophylaxis of O. must aim at (1) diminution of the introduction of fat-producing material in the food. (2) Increase of the trophic and plastic energy of the albumenised tissues of the body, especially those of the voluntary muscles. (3) Increase of the general stock of red blood corpuscles, by promoting their new formation. (4) Increase of the animal process of oxidation, by increased introduction of oxygen. In regard to diet, Immermann says:—'A diet which contains an abundance of albumen, little fat, few hydrocarbons, and not a great deal of gluten, is best suited to the prophylaxis against O. . . . The supply of gluten, hydrocarbons, and even fats must

never be so curtailed as to produce a considerable diminution of the natural feeling of strength, and of the functional capacity of the body; and, further, the supply of albumen must never be so great that disorders of digestion, or signs of the lithic acid diathesis are produced.' 1. The articles of food most *permissible* are: Meat broths of ordinary meats—beef and veal (both of them boiled as well as roast), lean ham; of game—venison (red or fallow-deer), hare, chamois, partridge, fieldfare, red grouse, heathcock, ptarmigan, pheasant; of domestic fowl—poultry, pigeon, turkey; of fish—pike, trout (both boiled, but not fried); of other remaining kinds of animal food—oysters and snails. Besides this, green vegetables of all descriptions (asparagus, cauliflower, green peas, beans, spinach, the common kinds of cabbage), prepared in the English or French manner (without fat); acid fruits (raw or stewed).

2. Articles of food which should habitually be partaken of only in small quantities are:—*Bread*, biscuits, *milk*, *eggs*, *potatoes*, carrots, and other vegetables of the like nature, dried husk fruit, rice, millet, buckwheat, mealy and sweet soups; *sugar*, as an addition to food and drinks (coffee or tea, for instance); of animal foods—mutton in every form, beef in the form of beef-steaks, veal as cutlet; of fish—carp; and besides, green salad with oil, and of dessert dishes, wine jellies.

'*N.B.*—The italicised words represent articles of diet widely used, but from their composition ill-adapted for the prophylactic method, and here enumerated among those articles which may be used in small quantities only, because it would be extremely difficult for most persons to give them up altogether.

3. Articles of diet which should be used very *exceptionally*, and then only in *very small quantities*:—*Butter* (as an addition to bread, potatoes, &c.; *cream* (as an addition to coffee); *fats*, hot and cold; *saucers* (especially hot butter sauces with fish, Mayonnaise with fish, lobster, poultry); of ordinary kinds of meat—*pork*, &c. (with the exception of lean ham), in every form and preparation, goose and duck; of game—black game, marmot, otter, wild duck, woodcock, snipe, quail, ortolan, lark; of fishes—eel, salmon, common trout, turbot; and of other kinds of animal food—crayfish, lobster, frog's thighs (with their ordinary accompaniment of fatty pastry); all sorts of stuffing (for tame or wild fowl), potato and meat salads, patties (especially *paté de foie gras*), sweets, pastry, *confitures*, creams, ices, sweet grapes (and particularly raisins), dates, and preserved candied fruits of all sorts, chestnuts, nuts, and almonds." See article 'Corpu- lence,' by Immermann, in *Cyclopedia of the Practice of Medicine*, by Dr. H. Von Ziemssen, vol. xvi. 1877.

Object, a term employed in metaphysics, æsthetics, and grammar. In metaphysics it denotes anything of which a think- ing being or *subject* can take cognizance. It does not follow that the thing of which cognizance is taken has any real or absolute existence. It may exist merely in the conception of the thinker; but whether it do so or not, it is equally in metaphysical lan- guage an O. In æsthetics the term is used in the adjective form. A poem, novel, or picture is said to be *objective* when the author has not allowed his own personality to colour the scene, the inci- dent, or the delineation of character; when everything stands out fresh and wholesome as from the hand of Nature. When the author, on the contrary, is full of himself, and throws his own individualism egotistically into whatever he does, he is then said to be *subjective*. Shakespeare and Scott are instances of the former; Byron and Victor Hugo of the latter. In grammar an O. is the name given to whatever directly determines the appli- cation of a verb. It may be a word, a phrase, or a clause. In the following sentences the words italicised are the O. of the ac- tion expressed by the verb:—*I lifted my hat*; *I wish you to suc- ceed*; *I believe that the man is guilty*.

Object-Glass, in a telescope or microscope, is the lens or combination of lenses which receives the parallel or diverging rays from an object and converges them to form the image which is viewed through the eye-piece.

Obliga'tion is, in Law, 'a legal tie by which one is bound to pay or perform something to another.' In England, the debtor is termed the *obligor*, the creditor the *obligee*. In Scotland, the corresponding terms are *obligant* and *grantee*. The difference between a real right and an O. is, that the former gives a *jus in re*, or right to possess or recover the subject; the latter gives only a *jus ad rem*, or right of action against the person who has become bound. See PROMISE.

Obliga'to (compulsory), a term in music applied to an inde- pendent or prominent part in a composition, written for a par- ticular instrument. An O. accompaniment is one that is essential, as opposed to one that is *ad lib*.

O'boe, an ancient and charming musical wind instrument, sounded through a reed. The Egyptians had instruments of this description, with reeds or straws inserted in the tubes. The old English name was wayght, but subsequently the French hautbois (derived from its high piercing sound) was current till about eighty years ago, when the Italian name came into use. The present form of O. was introduced about 1720. It has a double reed, is composed of three joints formed of wood, and is shaped like a clarinet, slender in the upper and spreading out conically at the lower end. Its usual compass is two octaves and one fifth, the deepest note being C below the treble clef. The natural notes are obtained by the stopping and opening of holes, and the semitones by the manipulation of keys. It is most effective in simple keys, is much used in pastoral pieces, and with its peculiar and rich tone is adapted for music either of a wailing and plaintive or of a calm and cheerful nature. The term O. is also applied to an organ stop formed by reed pipes made of brass.

Ob'olus (Gr. *obelos*, 'a spit'), the smallest of the four chief weights and coins among the Greeks, was of silver, and in the Attic system equalled $\frac{1}{4}$ grains troy, or $\frac{1}{16}$ d., six oboli (a handful) making a Drachma (q. v.). It derived its name either from its being stamped with a spit, or because in the barter of primitive times iron or copper nails were used as money (Aristot. ap. Poll. 9, 77).

O'Bri'en, an ancient Irish family, descended from Brian Boroihme (q. v.), one of the most celebrated heroes in the history of the nation. The successors of Brian called themselves kings of Thomond, became first tributary to the English, and finally in 1543 entered the ranks of the Anglo-Irish peerage, Murrough O., becoming Earl of Thomond and Baron of Inchi- quin. From Donough, a younger son of this Earl of Thomond, are descended the O'Briens of Dromoland in County Clare. Sir Edward O., fourth baronet, married the heiress of William Smith of Cahirmoyle, in County Limerick. He died 13th March 1837, and left several sons, of whom the most notable and unfortunate was **William Smith O.**, born 17th October 1803, and educated at Harrow, and Trinity College, Cambridge. He entered public life as a Tory M.P. for Ennis in 1826, but shortly changed his politics and was returned as a Radical for County Limerick in 1835. He was one of O'Connell's strongest supporters till the great Repealer alienated the extreme 'Young Ireland' party by refusing to use other than 'moral force' in his contentions with the British Government. An Irish Confederation was projected in 1846 with O. as its president, the assistance of France was unsuccessfully sought, an appeal was made to the peasantry to take up arms, and the affair culminated on 29th July 1848 in O.'s ridiculous attack upon a body of police near Balingarry, 'the battle of the cabbage- garden,' when eighteen of the rebels were killed. O. was apprehended at Thurles on the 5th August, and being found guilty of high treason was sentenced with three others to be hanged, drawn, and quartered, which sentence was commuted to transportation for life. He was, however, liberated in 1856. He died at Bangor, North Wales, 18th June 1864.

Obscene Publications. The Act known as Lord Campbell's Act gives additional power to the authorities for suppressing the trade in these. On any one making oath before a magistrate that he believes obscene books or prints to be kept in any place for sale, and on the magistrate being satisfied that the complaint is well founded, he may issue a warrant to a police officer to enter the premises, by force if necessary, and carry any articles which may appear to him suspicious before the magis- trate, who will pass judgment upon them, giving seven days' notice to the owner to appear at the trial. If the judgment be unfavourable, the articles are to be destroyed; otherwise, they are to be restored to the owner. An appeal lies to the next general quarter sessions.

Obser'vatory, a building equipped with suitable apparatus for the systematic observation of natural phenomena. An astro- nomical O. is concerned with the study of the heavenly bodies, a

magnetic O. with terrestrial magnetism, its variations and the laws that govern them, and a meteorological O. with atmospheric phenomena and their relation to weather and climate. Magnetic and meteorological observatories are invariably combined, and occasionally an O. devoted mainly to astronomical research possesses the means of conducting simultaneously the work of the other two.

The instruments of an astronomical O. are such as enable the positions, motions, and sizes of the heavenly bodies to be studied, and also the nature, arrangement, and motions of the molecules constituting these bodies. Accordingly, the instruments comprise the *transit instrument*, *transit circle*, and *mural circle* for meridional observations, the *equatorial*, and the *altitude and azimuth instrument* for extra-meridional observations, or study of objects in any part of the heavens, sidereal clocks and chronometers, spectroscopes, photo-heliographs, and many other auxiliary instruments. It is of prime importance that the situation of an astronomical O. be dry, and that the stone piers for the reception of the telescopes be stable, wholly unconnected with the walls of the building, and in the least degree affected by changes of temperature. Public observatories are established in all civilised countries, and by an exchange of the publications of each, showing the results of the work accomplished, astronomical science is constantly advancing. Many private establishments, too, in the United Kingdom especially, possess most perfect means of conducting astronomical investigations, and contribute greatly to the furtherance of the science. It is impossible to do more here than mention some of the principal British and foreign public observatories. The largest and most important O. in Great Britain is the Royal O. at Greenwich, which was founded in 1675 and stands on Flamsteed Hill, named after the first Astronomer-Royal. Greenwich O. 'was expressly built for the aid of astronomy and navigation, for promoting methods of determining longitude at sea, and more especially for determination of the moon's motions. All these imply as their first step the formation of accurate catalogues of stars, and the determination of the fundamental elements of the solar system. These objects have been steadily pursued from the foundation of the Royal O. The lunar deductions in connection therewith are probably the greatest single work ever undertaken in astronomy' (Report of H.M. Astronomer-Royal for 1875). In addition to the main pursuits, photo-heliographic, spectroscopic, meteorological, and magnetic investigations are carried on, and a system of correct time is maintained throughout the country by means of time-signals and clocks, electrically controlled by a standard clock in the O. Under the direction of the present Astronomer-Royal, Sir George B. Airy, the sphere of labour has been considerably extended and the instruments in use vastly improved. One of the latest additions to the equipment of Greenwich O. is a beautiful standard sidereal clock. The Royal O. for Scotland, situated on the Calton Hill at Edinburgh, was founded by the Astronomical Institution of Edinburgh in 1812, and transferred to the State in 1846. The principal work being conducted at this O. is the preparation of a catalogue of stars embodying the results of observations, as to the proper motions of those stars, taken during a period of 40 years prior to 1870. A mean-time clock in the O. electrically controls several clocks in the city, fires a time-gun at the castle, and simultaneously drops a time-ball on Nelson's monument. The meridional instruments are old or out of repair, but it is expected, consequent on the report of a Commission appointed in 1876 to inquire into the condition of this Royal O., that State aid will soon be given to render it more useful and effective. The equatorial reflector, which was designed by the present Astronomer-Royal for Scotland, Mr. Piazzi Smith, to meet the exigencies of the dome under which it is mounted, is remarkable for its 24-inch aperture in relation to the short focus of 10 feet of the silver-on-glass speculum. The observatories at Dublin, Oxford, and Cambridge, and, in the British Dependencies, the Royal O. at Cape Town, and the establishments at Mauritius, Melbourne, and Sydney are noteworthy for their importance and activity. Among foreign observatories those of Paris, Poulkova, and Cambridge (United States) occupy the first rank.

Obsidian, a term said to be derived from Obsidius, a Roman general, who first brought the mineral from Ethiopia, is a rock of volcanic origin, being found in lava streams. It is dark coloured, glassy in its structure, breaks with a distinctly con-

choidal fracture, and is indeed scarcely distinguishable from many metallurgical slags. In composition it is allied to felspar, containing generally 80 per cent. of silica, 10 of alumina, and varying small proportions of lime, potash, soda, and iron. From its hardness, and the sharp edge its fractured masses take, it has always been a favourite substance with all rude and savage nations where obtainable for cutting-tools, spear and arrow heads, and like purposes.

Ob'verse (Lat. *obversus*, turned towards or against), in numismatics, that side of a coin which bears the head or initials of the sovereign or other image of the state issuing the money.

Ock'am, William, one of the greatest schoolmen of the Middle Ages, known to his admirers and followers, as the *Doctor singularis et invincibilis*, was born at Ockham in Surrey in the latter part of the 13th c. He held several benefices in the English Church before entering the Franciscan order. He then proceeded to Paris, attended the lectures of Duns Scotus, and soon after became a lecturer himself. O. first singalised himself by coming to the rescue of Philippe le Bel in his contest with Pope Boniface VIII., arguing, in his *Disputatio Inter Clericum et Militem*, that Christ in *quantum homo* was not made the judge and censor of kings, and that the Popes have therefore no temporal dominion. The same principles he again asserted in the case of Béranger Salou, a Franciscan of Perpignan, charged in 1321 by Pope John XXII. with the heresy that the apostolical poverty ought to be imitated by the Church. O.'s *Dialogus de Hæreticis, de Erroribus Joannis XXII., et de Potestate Papæ Conciliorum et Imperatoris*, attacks bitterly the canon lawyers of the Church, and the Papal Infallibility. Infallibility resides only in a General Council of the Universal Church. The Pope himself was a noted heretic and sinner, and ought to be tried by a Council, and their sentence carried out by the Emperor. O. was thrown into prison at Avignon, but escaped to Munich, where, under the protection of Ludwig of Bavaria, he lived until his death, April 7, 1347. His *Opus Nonaginta Dierum*, which still retains an honoured place in the *Index Expurgatorius*, is another exposure of the corruption and inconsistency of the Papal position. But it is as the destroyer of the fictions and illusions of scholasticism that O. will be longest remembered. His doctrine of Nominalism demonstrated the unreality of 'universals.' This doctrine carried out, had an incredible influence in freeing philosophy from the trammels of super-sensible dogma. O.'s *Expositio Aurea* criticises the *Isagoge* of Porphyry and the *Categories* of Aristotle, and recalled Europe to a proper conception of the Aristotelian psychology and logic. O. also wrote on Predestination and on the *Sentences* of Peter Lombard. See Luke Wadding's *Scriptores Ordinis Minorum* (1650), Haureau's *De la Philosophie Scholastique* (Par. 1848).

Occasionalism, or the theory of occasional, instrumental, or conditional causes, was substituted by Malebranche for the continuous influence or assisting cause of Descartes. The problem was to account for the observed effects produced by matter on mind, two substances essentially distinct, and *vice versa*. A physical cause could not produce a mental effect, because the non-extended excludes the idea of the extended. The division is the most fundamental in human experience, and could not be bridged over by any of the ordinary metaphysical abstractions which did duty as *vera causa* in either of the two worlds. The only resource was to assume either that the first cause operated everywhere and always, thus depriving particular causes of all real efficiency, or that the first cause had instituted a set of subordinate causes for the purpose of overcoming the difficulty. This latter hypothesis, known as O., really meant that in certain circumstances or on certain conditions the first cause would supplement or vary the ordinary system of secondary causes established in the world. It was succeeded by Leclerc and Cudworth's Plastic Nature, *Ratio mersa in materiam*, *et veluti corpore ebria*, and by Leibnitz's Pre-established Harmony between the atoms, monads, or entelechies constituting the soul and those constituting the body, which is still the common conception of the mental and bodily life as parallel, and in a sense independent. It is rejected by those who dogmatically assert that mind is merely a function of the body. It is now seen that so far as the question of causes is concerned, the simplest set of physical, chemical, or vital conditions presents as much difficulty as the connection between mind and body, and consists, as regards our knowledge, merely of antecedents and consequents.

Occipital Bone, an important bone of the vertebrate skull, forming the hinder bone of the cranium in man and in vertebrates generally. In the newly-born child this bone consists of four distinct pieces: (1) a central or *basilar* portion lying in front of the *foramen magnum* or *occipital foramen*, through which the brain is continued to form the spinal cord; (2) and (3) two lateral portions (*ex-occipitals*), each supporting a *condyle* or rounded process whereby the skull articulates with the first or *atlas* vertebra; and (4) a large central portion or segment lying *above* the 'foramen magnum,' and known as the *supra-occipital* segment. The *basio-occipital* element of this bone or 'basilar' part in the adult skull unites with the *sphenoid* bone, whilst the upper surface is grooved for the reception of the *medulla oblongata* of the brain. In front of each 'condyle' is a foramen or aperture through which the last or 9th cranial nerve (*hypoglossal*) passes. The O. B. articulates with the *parietal* or side bones of the skull, and with the *temporal* bones. The bone itself is made up of two compact bony plates or *laminae*—the *outer* and *inner* tables—with a soft tissue, the *diploe* between them for the support of bloodvessels. In *Amphibia* the *basio-occipital* segment of the O. B. is represented by a cartilaginous portion, and its hinder end in reptiles and birds bears the single 'condyle' for articulation with the spine.

Occleve, Thomas, of whom little is known except through his writings, flourished about the beginning of the 15th c., living in Chester's Inn, Strand, where Somerset House now stands. He was a writer to the privy seal, and a very frigid but copious poet. A list of his poems, nearly all in MS., may be seen in Warton's *History of English Poetry*. His most successful attempt is a translation of *De Regimine Principum*, by the monk Egidius, in the prologue to which he gives us the only authentic portrait of Chaucer we possess.

Occultations, in Astronomy, are eclipses of stars or planets by the moon, or of stars by other planets. The term eclipse is restricted to the intervention of the moon or earth between the sun and the earth or moon. O. are ordinarily understood to mean the interception of a star's or planet's light by the moon; and such occurrences, predicted in the *Nautical Almanac* several years in advance, are valuable to the navigator as a means of determining his longitude or testing his chronometers. Only those stars can be occulted which lie within the limits of the moon's orbit, i.e., those stars which are confined to a belt of the heavens extending to 5° 8' 48" on either side of the ecliptic.

Ocean, a name used to denote the body of water which encircles the globe on every side and separates continent from continent. The O. covers three-fifths of the surface of the earth, and though strictly speaking there is but one O., yet it is divisible into certain areas more or less defined by the intervention of the land—the *Atlantic O.* (q. v.) between America and Europe and Africa; the *Pacific O.* (q. v.) between America and Asia and Australia; the *Indian O.* (q. v.) between Africa and Australia; the *Arctic O.* (q. v.) surrounding the N. Pole; the *Antarctic O.* (q. v.) surrounding the S. Pole. The properties and characteristics of the O. are described under SEA.

Oceania, the name given to the fifth division of land on the globe, including the great island regions of the Indian and Pacific Oceans. It is usually divided into four parts, viz., the Malay Archipelago, Australasia, or Melanesia, Micronesia, and Polynesia.

Ocellus, the name given to the rudimentary organs of sight found in lower animals (e.g. Jellyfishes, *Echinodermata*, etc.), and which are also found in Insects (in addition to compound eyes), in Arachnida (q. v.), &c. In insects the O. in its simplest form consists of a modified group of pigment-cells derived from the skin-tissues. According to Newport, a typical O. consists of a 'convex, smooth, single cornea, beneath which is a spherical crystalline lens, resting upon the plano-convex surface of the expanded vitreous humour, the analogues of the transparent cones of the compound eyes.' Müller states that the function of the ocelli in insects is that of perceiving near objects; the compound eyes being used to perceive distant objects. In adult insects they usually number three. In lower animals the O. are simple masses of pigment, covered by a lens; they are adapted to receive impressions of light and darkness, but are useless for more perfect perception.

Ocelot, the name given to various species of Carnivorous quadrupeds of the family *Felidae* (q. v.), and which appear to be closely related to the Leopards (q. v.). The Common O. (*Leopardus Pardalis*) occurs in tropical America, where it represents the Old World leopard. It attains a length of 4 or 5 feet. Its colour is a light or greyish fawn, marked with longitudinal bands of darker brown, edged with black. A dark band runs along the whole length of the spine. The head, neck, and inner aspects of the limbs are marked by spots of irregular shape. The ears are black; at the base of each there is a white spot. The O. exhibits all the ferocity and agility of the leopard, and preys upon smaller quadrupeds. It is not remarkably courageous, however, and will not face man unless brought to bay. It is said to be readily and permanently tamed. The Grey O. (*L. griseus*) also occurs in tropical America. It has a more uniformly light fur than the preceding, and the spots and dark markings are lighter than in the common O. The Painted O. (*L. pictus*) is still more definite and rich in its colour-markings. Along its throat a number of very dark streaks are to be seen, and the spinal mark is velvety black. Allied to the O. is the Margay (*L. Tigrinus*) of Guiana and other parts of S. America.

Ocelot.

Ochils (Gaelic, 'the heights'; Lat. *Ocellis Montes*), a range of hills in Scotland extending for about 24 miles through parts of Stirling, Perthshire, Clackmannan, Kinross, and Fife. The scenery is very peculiar in character, the hills from a distance appearing like artificial mounds, but in reality they are separated by deep clefts, so narrow as not to be visible at a distance. Of the peaks, the most picturesque is Dunmyat, and the highest Ben Cleuch (2340 feet). The hills are formed mainly of basalt and greenstone, and offer a rich field to the geologist. They are entirely occupied with sheep-farms.

Ochino, Bernardino, a noted Italian reformer, born at Siena in 1487, passed in 1525 from the Franciscan to the newly-founded and more rigorous Capuchin order, of which he was chosen general in 1538 and again in 1541. For forty years he had enjoyed a prodigious reputation for his oratory, purity of life, and devotion to the Catholic Church, when, suddenly in the August of 1542, we find him at Florence denouncing that Church as Antichrist. Cited to Rome, he fled to Geneva in the company, says Spondanus, of a young laundress, whom he subsequently made his wife. It is certain at least that he had four children, one of whom was married in 1562. After three years' stay at Geneva, O. visited Basel, Augsburg, and Strassburg, from the last place proceeding to England (1547), on the invitation of Cranmer, who made him a prebendary of Canterbury and Italian preacher at London. On Mary's accession (1553) he returned to Switzerland and held the post of pastor to an Italian church at Zurich from 1555 to 1563, when his *Dialogi XXX.*, containing an approval of polygamy, gave offence to Beza, who calls O. 'a most impure hypocrite, the concealed favourer of Arianism, and a mocker of all Christian doctrines.' Thenceforth O. was hunted like a hare by his co-religionists from Basel to Mülhausen, and from Nürnberg to Frankfurt, dying at last of the plague at Schlakow, in Moravia, in 1564. He was author of various treatises, both Catholic and Protestant, a list of which is given by J. Voigt in his *Catalogus Librorum Rariorum* (Hamb. 1732). See Karl Benrath's *B. O. of Siena* (Eng. trans. Lond. 1877).

Ochnaceæ, a natural order of dicotyledonous small trees or shrubs, with simple, alternate, toothed leaves, flowers solitary or in racemes, with their pedicels articulated in the middle, and fruit consisting of several-seeded carpels, attached to the large succulent prolongation of the receptacle. There are about 140 species, widely spread in tropical countries. They generally possess a bitter principle, and some are used as tonics, but are comparatively unimportant. Several species of *Gomphia* and *Ochna*, neat shrubs with yellow flowers, are in cultivation.

Ochre (Gr. *ōchra*, from *ōchros*, 'pale'; Fr. *ocre*) is a term applied to any compact earth or clay coloured yellow, red, or brown, from the combination of hydrated sesquioxide of iron.

O. is used as a painter's and artist's pigment. It is the *sil* of the Romans. O. occurs chiefly in the Secondary and Tertiary deposits. It is extensively mined in France, that of Vierzon being most esteemed for its rich yellow colour. In Cornwall large quantities of ochrey pigments are obtained from the ferruginous sediment, resulting from the treatment of tin and copper ores of poor quality. Holland produces much O., and Anglesey and the Isle of Man are also sources of varieties of this mineral.

Och'terlony, Sir David, a distinguished Indian officer of Scotch extraction, was born at Boston, U.S., February 12, 1758, entered the service of the East India Company, and took part in the wars against Hyder Ali at the close of the last century. In 1804 he defended Delhi with a small force against a Maharratta army under Holkar. In the Goorkha campaign of 1814, his was the only division which did not meet with disaster, and the successful issue of the war in the following year is mainly to be attributed to his wisdom and bravery. He was subsequently employed in the political or diplomatic department. He died July 15, 1825, at Meerut, while Political Resident for Delhi and Central India. A column of mixed architecture was erected to his memory in the Maidan, or Park of Calcutta.

Ockley, Simon, born at Exeter in 1678, entered Queen's College, Cambridge (1693), became vicar of Swavesey, in Cambridgeshire (1705), and Professor of Arabic in the University of Cambridge (1711), and died at Swavesey, August 9, 1720. His *History of the Saracens* (1708-18) is commended by Gibbon, who speaks of the author as 'an original in every sense, who had opened his eyes;' but it brought little profit to O., the second volume being dated from Cambridge Castle, where he was imprisoned for debt. Other works by O. were *Introductio ad Linguas Orientales* (1706); *An Account of South-West Barbary* (1713); and translations from Italian and Arabic.

Ockmul'gee, a river of the United States, rises in and flows mainly S.S.E. through Georgia to Colquitt, where it joins the Oconee and forms with it the Altamaha. It is navigable to Macou, and is about 300 miles in length.

O'Clery, Michael, the greatest of the 'Four Masters,' was born near Ballyshannon, in Donegal, Ireland, about 1575, entered the Franciscan Order, and spent his life in collecting materials for elucidating the history of his native island. He was assisted by three other Irish antiquaries, Conary O'Clery, Cucogry O'Clery, and Forfeara O'Mulconry. The result of their labours was the *Annala Rioghachta Eireann* ('Annals of the Kingdom of Ireland'), commonly called 'The Annals of the Four Masters.' The best edition is that by Dr. John O'Donovan (3 vols. Dub. 1848-51; 2d ed. 7 vols. 1856), which contains, besides the Irish text, an English translation and valuable notes. Another work of O., *The Martyrology of Donegal, a Calendar of the Saints of Ireland*, was also edited by Dr. O'Donovan (Dub. 1864). Several of his compositions remain in MS. O. died at Louvain in 1643.

Oco'nee, a river in Georgia, United States, rises near Hartford, and flows S. by E. almost parallel with the Ockmulgee, to Colquitt, where with the latter river it forms the Altamaha. It is navigable to Milledgeville, 90 miles from Colquitt.

O'Connell, Daniel (known as the 'Liberator,' the 'Irish Agitator,' and the 'Champion of the Church'), was born at Carhen, Co. Kerry, 6th August 1775. His family was an old one which had been deeply implicated in the rebellion of 1641; his great-grandfather had commanded a company of foot at Derry, the Boyne, and Aughrim, and was included in the capitulation of Limerick. Educated at the local school, and at St. Omer and Douay (the president of which told him that he was 'destined to make a remarkable figure in society'), O. arrived in England in 1793. He became a student of law at Lincoln's Inn, and ultimately attached himself to the Munster circuit. 'A large and well-used law library, numerous *liaisons*, a pack of beagles (for hare-hunting), and a good collection of fishing-tackle, attest the variety of his tastes.' This strong healthy animalism lasted all through his life. In 1800 and 1803 he took the side of loyalty with the yeomanry against the United Irishmen. In 1802 he married his cousin, Mary O. of Tralee, and thus lost the inheritance of his uncle, 'Old Hunting Cap.' O.'s skill in addressing juries, and frightening and coaxing witnesses, and his popular speeches on the lost Irish Parliament, brought him a great deal of *nisi prius* business; and in Curran's Rolls Court,

he also succeeded. It was not till 1809—after both Pitt and Perceval had proved untrustworthy on the subject of Catholic emancipation; after Saurin and the other government lawyers of the day had, by reviving obsolete statutes and instituting press prosecutions, done everything in their power to irritate the Irish population—that O. began to be recognised as the political leader of the Pacifators (in Conciliation Hall) or Repealers (in Mullaghmast), Delegates, Associators, Precursors, who carried on a sort of sham Parliament with the object of repealing the penal laws, collecting and administering the rent, and keeping up the popular agitation. To this work he devoted a great part of a hard-working life, rising at five in the morning, and abstaining from wine and spirits, though these had become almost essential to him. At this time he was 'the best abused man in Ireland.' The corrupt Orange municipality of Dublin passed a resolution to have him shot, which led to O.'s duel with D'Esterre, the latter being killed. Soon after he was challenged by Mr. (afterwards Sir Robert) Peel, secretary to the lord-lieutenant, but this duel was prevented by the police, and O. then registered a vow against the use of duelling pistols. Gradually the efforts of the Catholic Association told, the liberalism of the Canning policy prevailed, and Catholic Emancipation became an open question before 1825. On 5th July 1828 O. was returned for Co. Clare against the popular and liberal Lord Fitzgerald. He entered the House, and proposed to take his seat without taking the oaths except that of allegiance. Next year the Relief Bill passed, and O. became a member for all Ireland. He now sought to revive the movement for Repeal of the Union, which he had only laid aside for Emancipation. In 1831 he was charged along with Messrs. Steele and Barrett with holding meetings contrary to proclamation, but the statute authorising the prosecution expired before the trial could begin. After the Reform Bill, O. represented the following places in succession:—Co. Waterford, Co. Kerry, Dublin, Kilkenny, Dublin, Cork. His motion for repeal was first submitted in 1834, when the division was 523 to 38; 'the O'Connell Tail,' as it was called, being mostly returned by clerical influence. By an adroit use of the 'Tail' he managed to secure much Irish patronage during the Melbourne Administration of 1835-41. When 'the base, brutal, and bloody Whigs' left office, the agitation for repeal increased. Monster meetings were held on the royal hill of Tara, the Curragh of Kildare, the Rath of Mullaghmast. A great military review was announced for the historic plain of Clontarf. Before this, however, O., his son, C. G. Duffy of the *Nation*, Gray of the *Freeman*, Barrett of the *Pilot*, Rev. Mr. Tieney, and others, were arrested and tried for seditious practices. The sentence, imposing a fine of £2000 with imprisonment for a year, was afterwards set aside by the House of Lords on a technical point relating to the loss or theft of some of the jury slips. After this O.'s spirit was somewhat broken, and his purse was also emptied. He entered into friendly relations with Lord John Russell, spoke in favour of the abolition of the corn laws, and proposed test resolutions for the Repeal Association which condemned every effort to redress political wrongs by physical force. This very much disgusted the Young Irish war party, which has subsequently developed into the two branches of the Nationalists. The health of the old warrior was now breaking. The terrible events of 1846-47 further prostrated him, and he died at Genoa, 15th May 1847. O. was one of the greatest of modern speakers. His language was often coarse, and he seldom reasoned conclusively. He had no wide political intelligence, and on all subjects his mind was cramped by Catholic teaching. But he was full of imagination and humour, and possessed an intensity of passionate statement which won its greatest triumphs with the Irish mobs, yet made a deep impression on the House of Commons also. See his son John's *Life and Speeches of D. O.* (2 vols. Dub. 1846-47); Fagan's *Life and Times of D. O.* (2 vols. Cork, 1848). In 1877 a centenary edition of O.'s life was published.

Octagon (Gr.) is any closed figure of eight sides. When the sides are equal and lie all in one plane, the angles are also equal, and the figure is a *regular O.* The regular O. may be easily formed by bisecting each of the four equal arcs into which the circle circumscribing a square is divided.

Octahedron is a solid figure bounded by eight faces, and having twelve edges and six angles. The *regular O.* has its faces and edges all equal, and may be regarded as formed of two

equal square pyramids, with equilateral triangles for sides, placed base to base. The O. is a form of crystal which certain minerals, sulphur, for instance, assume.

Octave in music. (1) The interval of an eighth.

Major Octave.

Minor Octave.

Augmented Octave.

In the major O., the two notes being struck together form almost one sound, the vibrations in the higher being exactly twice in number those of the lower note. (2) The complete series of notes in the scale.

Great Octave.

Small Octave.

Once marked octave, the notes being written C', D', &c.

Twice marked octave, C', D', &c.

Octave in alt. (the octave higher being in altissimo).

Octavia, a sister of the Emperor Augustus, was first married to C. Marcellus, consul in B.C. 50, and on his death in 41 to M. Antonius. Her beauty, virtue, and accomplishments effaced for awhile the charms of Cleopatra from Antony's breast, but called to the East by the Parthian war (36), he suffered O. to attend him only as far as Coreyra, and himself proceeding to Asia, soon forgot wife and glory alike in the arms of the Egyptian wanton. O. started, nevertheless, in the year following, to co-operate with arms and money against the Armenians, but was met at Athens by a message commanding her return. She obeyed, and, formally divorced by Antony (32), lived quietly at Rome, bringing up his younger son by Flavia, Julius, along with her own family, and after Antony's death (30) even adopting his children by Cleopatra. She died in 11 B.C., and was publicly buried, Augustus pronouncing the funeral oration.

Octet or Ottetto (in music), a composition for eight instruments or voices.

October (Lat. *octo*, 'eight') was the eighth month of the year of Romulus, which began with March. The Roman Emperors Commodus and Domitian attempted in vain to change its name to *Faustinus*, *Invictus*, or *Domitianus*. It is the tenth month of our year, and consists of 31 days. Chief among the ancient festivals which occurred in O. was the sacrifice to the god Mars of *Equus Octobris* ('the O. horse') among the Romans. The blood, which dropped from its tail was preserved by the Vestal virgins in the temple of Vesta for the purpose of being burnt to procure a purifying smoke at the festival of the Palilia on the 21st of April. Our English forefathers called it the *winter-fylleth* ('the winter full moon'), because the full moon in October was reckoned by them to mark the beginning of the winter season.

Octopoda (Gr. 'eight-footed'), a family of *Cephalopoda* (q. v.) or Cuttlefishes, in which eight arms of equal length are developed. The O. are *Dibranchiate* or two-gilled cephalopods. The body is usually oval or globose, and the suckers unstalked. There is no pallial shell, but in one genus (*Argonauta*), represented by the paper nautilus, two of the expanded arms secrete the delicate paper-like shell.

Octopus, the typical genus of the Cephalopod family *Octopoda*, which is characterised by having eight arms and two branchiæ. The English name for the true O. is *poult*, and the German *see-spinne* (sea-spider). These molluscs frequent the Mediterranean and contiguous seas, but only lately have their habits been studied with any degree of success. We owe this increase of knowledge solely to the establishment of aquaria in this country and on the Continent. The poulters are extremely pugnacious, and resent the intrusion of any new-comer. Combats with lobsters in the tanks of aquaria have been often observed, and result usually in favour of the O., whose flesh is too

soft and spongy to suffer permanent injury from the clutches of his foe. The female deposits her eggs within a nest of large stones, sitting over them and guarding them with the carefulness of a hen. If hard pressed, the O. covers his retreat in an inky discharge, which disappears through gradual oxidation. That the poult has a more than ordinary degree of intelligence is attested by Professor Kollman, who records that those in the Naples aquarium recognise their keeper and even exhibit attachment to him. The O. is endowed with keen eyesight and well-developed ears, can swim backwards or forwards, and can use his limbs for crawling, grasping, feeling, &c. He has been known to leap 4 feet out of the water, and can change his colour through almost all the shades of the rainbow. See *The O., or the Devil Fish of Fiction and of Fact*, by Henry Lee (1876).

Octroi, or **Octroy** (Low Lat. *autorium*, from *autoritas*), originally a privilege or monopoly granted by a sovereign to an individual, in modern times denotes a tax levied in France on articles of produce destined for local consumption, and paid on their entering the gates of a city. The O. was at first solely devoted to the profit of the towns, but since 1663 a part has been taken by the National Treasury (at present 1/10th). It was suppressed in 1791, but it was found necessary to re-establish it in 1797, and since that date it has given rise to much legislation, and was last reorganised in 1852. The O. was abolished in Belgium in 1860, and, though it never existed in England, has something analogous to it in the coal-tax levied for the good of the City of London.

O'Curry, Eugene, an admirable Irish scholar, was born in County Clare about 1795. Along with Dr. O'Donovan he was employed to transcribe and translate the ancient Irish laws (see BRENNON LAWS), was afterwards appointed Professor of Irish History and Archaeology in the Catholic University of Dublin, and died 30th July 1862. His *Lectures on the Manuscript Materials of Ancient Irish History* (1861) are among the finest fruits of Celtic scholarship, and are indispensable to every student of the national history.

Od, the name invented by Baron Reichenbach, and applied to what he deemed a new force in nature. This odic force was all-pervading, and manifested itself in certain circumstances as a luminous appearance at the poles of magnets, of crystals, &c. These appearances were supposed to be more evident to some persons than to others. The whole hypothesis seems to have been a fanciful theory with no true foundation in fact, and is now generally discredited. There is, however, a strong resemblance between the properties of this odic force and the so-called phenomena of modern spiritualism.

Odal or Udal Right is a tenure of land from the Crown, which is said to have prevailed in Britain before the introduction of the feudal system, and is still to be found in Orkney and Shetland. The tenure was completed without charter by undisturbed possession for a certain period, which might be proved by witness before an inquest. The tenant was called a Udaller, and he paid a tribute called *skat* to the Crown.

Oddfellows, Independent Order of, the name of a very extensive body of friendly societies with a large membership in Great Britain and Ireland, the United States, and various parts of the world. In the latter part of the 18th c. a society composed of London mechanics held convivial meetings under the name of 'The Ancient and Honorable Loyal Odd Fellows,' from which the 'Union Order of Odd Fellows' sprang. Attempts to abolish the convivial element induced a schism in 1812, when the Manchester Unity was founded. In 1825 a central standing committee was formed in Manchester, and since that date the Manchester Unity has included the great body of Oddfellows in this country. The objects of the society are to raise a fund by mutual contributions to meet payments on the deaths of members and their wives or widows, the relief of sick and aged members, and various other charitable purposes. Distressed lodges may apply for assistance to the districts with which they are connected, and distressed districts to the Unity. The number of members in Great Britain and Ireland and the colonies amounted on 1st January 1877 to 518,370, distributed among 457 districts and 4114 lodges; 475,887 members, 424 districts, and 3591 lodges being in Great Britain and Ireland alone. 3984 lodges in all supplied returns of their

income and expenditure during the year 1876. The amount received in contributions was £522,048, 16s.—an average of 20s. 6½d. per member, and the total income was £683,650. The expenditure was £435,999, 2s. 4d., of which £339,063, 5s. 6d. was for sick benefits (average, 13s. 4½d. per member), and £96,935, 16s. 10d. for funeral benefits (3s. 9½d. per member). The capital on hand on 1st January 1877 was £3,933,245, 14s. 7d. The *Oddfellows' Magazine* is a quarterly publication. The order is established in every state and territory in the United States, but since 1843 the organisation in that country has had no connection with that in Great Britain. The Grand Lodge at Baltimore is the centre of the American body, which numbered on December 31, 1873, 414,815 lodge members and 80,131 encampment members. The aggregate relief granted during 1873 was \$1,490,274.

Ode (Gr. *ōdē*, contracted from *ooidē*), with the Greeks and Romans, denoted any poem intended to be sung to the accompaniment of the lyre. The great classic composers of odes were Pindar, Anacreon, and Horace. Ronsard (q. v.), who introduced the O. into modern poetry, adopted Pindar as his model, ignoring, however, that poet's division into the strophe, antistrophe, and epode. In present usage, the term is applied to a composition irregular in metre, and differing from a song in its greater length, and from an epic in its dealing, not with deeds and events, but with the author's thoughts and emotions. Among our grandest odes may be reckoned those of Milton, Dryden, Gray, Shelley, Coleridge, and Wordsworth.

Odenkirchen, a town of Rhenish Prussia, 16 miles S.W. of Düsseldorf, on the Niers, a tributary of the Maas, has manufactures of silks, half-silks, woollens, and half-woollen stuffs. Pop. (1875) 7848.

Odense (old form *Odinsø*, 'Odin's sanctuary'), the chief town of the Danish island of Fünen, situated on the O. Canal and the Odenseaa, 3½ miles from its mouth, and 88 miles W. by S. of Copenhagen. The old town lies N., and the new, called the Albani quarter, S. of the river. The chief buildings of O. are St. Knuds Kirke, built 1081-93, burnt in the 12th and 13th c., and restored in 1864; Vor Frue (Our Lady) Kirke, 12th c., restored 1851-65; St. Hans Kirke, restored 1823-24; the castle; and the town-house. One of the oldest towns in Denmark, O. owed its importance in the middle ages (when it had six monasteries), to King Knud IV., the first Danish martyr and saint, killed here 1086 in St. Albani Kirke, and buried in the church named after him, to which many pilgrimages were made. O. was burned in 1247, and was the seat of the National Diets of 1527, 1539, and 1657. Pop. (1870) 16,970.

Odenwald ('Odin's forest'), a wooded mountain district of S. Germany, in the E. of Hessen-Darmstadt, 40 miles in length by 24 to 30 in breadth, extending between the Neckar and the Main as a continuation of the Schwarz-wald. The general elevation is about 1600 feet, while the highest point, Winterhauch, rises to 2063 feet.

Ode'on (Gr. *Odeion*), a Greek building in the style of a theatre, but of a smaller size, used for rehearsal of odes and music. The first O. was erected by Pericles; the most splendid was that of Herodes Atticus.

Oder (Lat. *Viadrus*, Slav. *Odra*), one of the chief rivers of N. Germany, rises on the N. slope of the Odeergebirge, in the Austrian province of Moravia, about 5 miles from Olmütz, at a height of 2057 feet above the sea. After passing through the Austrian province of Schlesien, it enters Prussian Schlesien at Oldersberg, and flows mainly N.W. through Brandenburg and Pomerania to the Stettiner Haff, from which it empties itself into the Baltic by the Divenow, Peene, and Swine, inclosing the islands of Wollin and Usedom. The O. becomes navigable at Ratibor, where it has a breadth of 106 feet; at Oppeln it is 266 feet wide, and at Breslau 597 feet. Its chief tributaries are, on the right, the Klodnitz, the Malapane, rising in Poland, the Warthe, and the Inna on the left, the Oppa, Ohlau, and the Peene. The O. has a length of 513 miles, and drains an area of 46,920 sq. miles.

Odessa, the most important Russian seaport and commercial town on the Black Sea, and the third city of the Empire, is situated between the mouths of the Dniester and the Bug, and is

connected with the former by a canal commenced in 1872. The houses are built of limestone, with flat iron roofs. The finest part of the town stretches along the edge of the elevated platform, in which the land here terminates, which is skirted by a magnificent promenade descending to the shore by a spacious stairway. Good water was first supplied to the town in 1874 by an aqueduct from the Dniester. O., which is the capital of the government Kherson, and the seat of an archbishop, contains 2 cathedrals, 34 churches, 31 synagogues, 2 monasteries, and a university, founded in 1865, with an observatory attached. The university is (1877) the only institution of the kind in S. Russia, and in 1876 had 43 professors, 252 students, a library of 150,000 vols., and schools of history, law, mathematics, sciences, and physics. The harbour consists of three parts, one for merchantmen, one for war ships, and one for vessels in quarantine. The quick growth of this town has been owing not only to the construction of the South Russian railways, but also to the proximity of two large navigable rivers. It has regular steam communication with Constantinople, Galatz, Taganrog, Berdiansk, Nicolae, and Kherson, and the trade with China and Japan has received a great impulse from the opening of the Suez Canal. The exports in 1874 amounted to 46,977,898 roubles, of which ¾ths were in wheat; next in value being wool, rye, spirits, barley, and turnip seed. The imports were valued at 42,375,238 roubles, the chief items being cotton, oil, coal, coffee, tea, iron, and hardware. In the trade with O. Great Britain takes the largest part, 180 British vessels having entered the port in 1873, with a tonnage of 144,357. During the last few years the industries of O. have increased in importance, and now embrace, besides shipbuilding, which takes the most important place, the manufacture of flour, macaroni, ship provisions, ropes, &c. Pop. (1873) 162,814, of whom about 6000 were Germans. Near O. lay the ancient Greek colony of *Odessus*. The Turks erected here the fortress Hadshibei, in the place of which O. was founded by the Vice-Admiral Joseph de Ribas, under the Russian Empress Catherine II. in 1794. At the commencement of the Crimean War, the steamer sent from Britain to take away the British consul, having been fired upon by the batteries of O., the town was invested by 12 British men-of-war, and its fortifications destroyed in a few hours.

Odeypoor (*Odaipur*), a native State of Chota Nagpur, India, in political connection with the Bengal government. Area, 1051 sq. miles. Pop. (1872) 27,708, of whom 73 per cent. are aboriginal tribes; revenue in 1874-75, £2762; tribute, £53. Much of the area is jungle. The products are rice, oil-seeds, cotton, gold, and lac. Gold is washed in the rivers, and coal is known to exist. The late Rajah was dethroned in 1859 for participation in the Mutiny, and sent to the Andaman Islands.

Odin is in Northern Mythology (q. v.) the highest of the gods. He rules over all, and is called *Allfödr* ('Father of all'), also *Valfödr* ('Father of Battle'), as 'they that die in battle are his beloved sons.' War is called the sport, and the sword the fire of O. He is the wisest of all, and is described as old, tall, long-bearded, and with but one eye, having bartered the other for a drink of the giant Mimir's Well of Wisdom, under the ash-tree of Ygdrasil. In his great hall in heaven, named Valaskjálf, roofed with figured gold, is the high seat Hlidskjálf, from which O. can survey the whole world. On his eight-footed horse Sleipnir he rides through the air, clad in a dark blue cloak, with a helmet of gold, and bearing his spear Gungnir, the work of the dwarfs. Wine is O.'s sole food, and the meat on his table is given to his two wolves Geri and Freki. His two ravens, Hugin ('thought'), and Munin ('memory'), are sent forth at daybreak to return at eve, when they sit upon his shoulders and tell all that they have seen and heard. O.'s attendant is named Hermod the Nimble. From O.'s gold ring, Drypnir (also made by the dwarfs), drop every ninth night eight gold rings of like weight. O. was the inventor of runes. With much ado he found the *Skaldunjad* ('Scalds' mead'), which the giant Suttung had hid in a mountain; hence poetry is called the Drink of O. and of the *Æsir* (q. v.), and this he and they quaff every day from golden cups in his palace of Sökkvabek. The name of O. is preserved in many names of places, as Odense (q. v.), Odinshöi, Önsbjerg, and Önsild in Denmark, and in Slesvig Vonsbæk, Vonsild, and Vonsmose.

Wodan (Old Eng. *Woden*) is the Low-German, and *Wotan* the High-German name of the same god. It is from a verb meaning 'to storm' or 'rave'; comp. Old Eng. *wōd*, and Low.

Scot. variant *wud*, 'mad.' The only pre-Christian writings in which Wodan is expressly mentioned are the two so-called Merseburg Poems, but tradition strongly testifies that the same myths clustered round Wodan in Germany as round O. in Scandinavia. The Lord of Heaven, whose single eye, broad-brimmed helmet, and dark mantle symbolised the sun, the clouds, and the firmament, was not only the giver of fruitful seasons, and the fulfiller of wishes, but inspired the poet and the warrior, and was the source of all knowledge. He was the god of the state, of all public business, laws, and solemn oaths, and kings traced to him their origin and power. Under the Roman Empire the Low-Germans, identifying Wodan with Mercurius, translated the Roman *Dies Mercurius* (Fr. *mercredi*, Ger. *mittwoch*) by the term *Wodnesdag*, which is still preserved in our *Wednesday*. Numerous local names attest the popularity of Wodan's worship, as, in Germany, Godesberg (*Wodenesberg*), Gudensberg, Godensholt, and in England, Wednesbury, Wednesham, Wansford, Wanstrow, and Wanstead. See references under NORTHERN MYTHOLOGY, also Bender, *Die Deutsche Ortsnamen* (Siegen, 1846).

Odoacer, king of Italy, was the son of a chieftain of the Scurri, Edecon, who with Orestes had been despatched by Attila on an embassy to the Emperor Theodosius (448). On the dispersion of the Scurri by the East Goths (463), O. led for awhile a wandering life among the Barbarians of Novicum, till, entering the service of the Western Empire, he gained a high rank in the Imperial Guards by his courage and capacity. In 476, with the aid of these mutinous mercenaries, he besieged Pavia, put Orestes to death, and deposing his son Romulus Augustulus, the last of the Roman emperors, himself assumed the title of king. The submissive Italians received him without a murmur, but the better to establish his authority he sent ambassadors to the Emperor Zeno, consenting to the transference of the seat of universal empire from Rome to Constantinople, while requesting his own investiture with the title of Patrician and the administration of the diocese of Italy. O.'s fitness for his high station was evinced in his respect for the institutions and prejudices of his subjects, in his re-establishment of the consulate, and enforcement of the edicts of his predecessors. Himself an Arian, he exercised toleration towards the Catholics; and once more he carried the Roman arms beyond the Alps, in two successful campaigns against the Dalmatians and Ruvians (487). His greatness, however, kindled the jealousy of Zeno, who supported Theodoric (q. v.), king of the East Goths, in the invasion and conquest of Italy (479). Defeated at Aquileia, Verona, and on the banks of the Adige (490), O. threw himself into Ravenna, which he had made his residence. After a three years' siege he reluctantly consented to the partition of the Italian provinces, and six days later was stabbed at a banquet, March 5, 493. See Gibbon's *Decline and Fall of the Roman Empire* (chaps. xxxviii., xxxix.).

Odometer (Gr. *hodos*, 'a way,' and *metron*, 'a measure'), a way measurer or instrument for measuring the distance travelled over by a wheeled vehicle. In one form it is designed for attachment to the wheel of a carriage, and in another to be dragged after the vehicle, or driven by a pedestrian, the number of revolutions of the carriage-wheel in the former instance, and of the wheel of the machine itself in the latter, being calculated by a series of index wheels. A kind of O. is described by Vitruvius. In 1550 a degree of the meridian between Paris and Amiens was measured pretty accurately by means of an O. Butterfield in England (1677), Meynier in France (1724), and Hohlfeld in Prussia (about 1760) altered and improved the construction of the O. See PEDOMETER.

O'Donnell, Leopold, Duke of Tetuan, Count of Lucena, of Irish descent, was born at Santa Cruz in Teneriffe, 12th Jan. 1809. By 1832 he had risen to be a colonel in the army, and became a declared partisan of Maria Christina's regency. He compelled Cabrera to raise the siege of Lucena (July 1839), and was appointed lieutenant-general. That year he threw in his lot with the queen-mother and followed her to France, from which he intrigued against Espartero, the regent. After the fall of the latter in 1843, he was nominated captain-general of Cuba. In 1845 he returned with an ample fortune, and was elected to the Senate, holding the post of director-general of cavalry until 1851. He was outlawed for his share in an insurrection (1854), reinstated by Espartero, who

created him a marshal, and whom he supplanted by *coup d'état* (July 1856). From 1858 to 1866 he acted as Prime Minister, conducting in person during that period a war in Morocco, whose successful termination lifted him into the highest rank of the Spanish nobility; but in 1866 his government was overthrown by Narvaez. O. died in exile at Biarritz, 5th Nov. 1867.

O'Donovan, John, LL.D., the prince of Irish scholars, was the son of a small farmer, and was born at Atateemore, in the county of Kilkenny, Ireland, 9th July 1809. In 1830 he was appointed to an office in the historical department of the Ordnance Survey, Ireland, and was employed to examine Irish MSS. and gather local information, for the purpose of fixing the orthography of places on the Ordnance maps. O. was also conjoined with O'Curry (q. v.) in the transcription and translation of the Brehon Laws (q. v.). In 1849 he was appointed Professor of the Irish Language in Queen's College, Belfast. He died at Dublin, 9th December 1861. No Irish scholar has equalled O. in the amplitude and accuracy of his philological and historical knowledge of the national language; his topographical erudition was also immense. His most important works are his *Grammar of the Irish Language* (1845), and his edition of *The Annals of the Four Masters* (2d ed. 1856), besides which, however, he edited several very interesting volumes for the *Irish Archaeological and Celtic Society*.

Odontophore, the name given to the dental apparatus characteristic of the highest classes of Mollusca (*Pteropoda*, *Gastropoda*, and *Cephalopoda*), which are hence collectively named *Odontophora*, in contradistinction to the *Lamellibranchiata* in which no O. is developed. The O. is often named the 'tongue' of Mollusca. It consists of a *cartilaginous skeleton*, of a *radula* or *lingual ribbon* armed with flinty teeth, and which is gradually reproduced from behind as it is worn away by the friction in front; and of the *muscles*, by means of which the radula is moved like a chain-saw, and thus rasps down the food on which the animal subsists.

Ecodoma, a well-known genus of the Ant (q. v.), celebrated for their intelligent habits. The species are abundant in America. *Ec. Mexicana* is common on the Gulf coast of Mexico; *Ec. cephalotes* and *Ec. sexdentata* are found in large numbers in Brazil. The *Ec.* are popularly termed 'leaf-cutters.' They cut and transport leaves to great distances. They build very large nests, occupying a surface frequently of many square yards. A large tree may be stripped of its leaves in a single night by these insects, who are also known to tunnel beneath rivers and streams when occasion requires.

Ecclampadius, Johann (orig. Ger. *Heussgen* or *Hussgen*), a German Reformer, was born at Weinsberg, Wirtemberg, 1482. Having abandoned the study of law, which he had begun at Bologna, he studied theology at Heidelberg, Greek at Tübingen and Stuttgart under Melancthon and Reuchlin, and Hebrew at Heidelberg under a converted Jew Adrian, and became a priest. While preacher in the Minster at Basel he assisted Erasmus with his edition of the New Testament. He became a monk in 1520, but being soon infected with the opinions of Luther, he escaped from the convent and returned to Basel (1522), where he joined the Reformers, and spent the rest of his life as a preacher and professor of theology. He died 1st December 1531. *Ec.* took a prominent part in the controversy between Luther and Carlstadt regarding the Real Presence (q. v.), having published his views in a letter to his friends in Swabia, entitled 'A Genuine Exposition of the Words of our Lord—This is my body.' Like Zwinglius he maintained that the bread and wine were mere symbols, but differed from Zwinglius, who regarded the word *is* as equivalent to 'represents,' in regarding *body* as used by metonymy for 'symbol of my body.' His other works were chiefly commentaries on the books of the Bible, which were of considerable value owing to his philological and Patristic knowledge. See Heizog's *Das Leben des Joh. Ecclampadius* (Basel, 2 vols. 1843), and the later biography of Hagenbach (Elberb. 1859).

Ecumenical. See ECUMENICAL.

Edeema (Gr. 'a swelling') is caused by the effusion or infiltration of serum into the cellular or areolar structures. O. may also occur in the submucous and subserous cellular tissues of the parenchymatous viscera. O. is not a distinct disease, but a symptom of a great variety of diseases, and the gravity of the symptom depends

very much upon the locality of the disease; thus *O.* of the *glottis* may cause death in a very short time. *Active O.*, which is by far the most common form, is associated with an inflammatory action in the cellular tissue, and is peculiarly well-marked in erysipelas, and in inflammation of the lungs. *Passive O.* depends on impeded venous circulation, due to obstruction or obliteration of one or more veins, and may result in a variety of local symptoms, according to the nature and extent of the obstruction. Organic diseases of the heart, lungs, liver, and kidneys, give rise to distinct local symptoms, and the amount of *O.* is often commensurate with the danger which exists. *O.* is frequently caused by interruption of the venous circulation owing to the pressure of gravid uterus and abdominal tumours.

Ödenburg (Hung. *Soprony*, Lat. *Sempronium*), one of the oldest and most beautiful towns in Hungary, 37 miles S.E. of Vienna by rail, is situated among the spurs of the Leitha mountains, on the Ilika, a branch of the Raab, and two miles W. of the Neusiedler See. It has three large churches, several monasteries, and a theatre. The town watch-tower is reckoned the highest in Hungary. Cloth, sugar, and preserved fruit are manufactured, and in the surrounding district one of the finest wines of Hungary is made. The coal obtained from the neighbouring Brennberg forms also an article of trade in the town, whose annual cattle markets are much resorted to. Pop. (1869) 21,108.

Œdipus (Gr. *oideō*, 'I swell,' and *pous*, 'foot'), in the Greek myth was the son of Laius, King of Thebes, and Jocaste, who, to avert an oracle that their child should some day slay the father and commit incest with the mother, pierced his feet and exposed him on Mount Cithæron. Found by a shepherd, he was brought to Corinth, to the palace of Polybus and Merope, who reared him as their own child till he had grown a man. But the stigma of his unknown origin affixing itself to his name, he repaired to Delphi to inquire of its truth, and there received the selfsame answer that had affrighted his true parents. Applying it, however, to Polybus and Merope, he determined never more to return to Corinth, and on the way to Daulis fell in with Laius. A scuffle arose, and *O.* slew his father, thus working out the first part of the doom. Shortly after, the ravages of the Sphinx (q. v.), who killed all who failed to solve her riddles, caused proclamation to be made that her vanquisher should receive the hand of Jocaste. *O.* fulfilled the task, and wedding his mother became by her the father of Eteocles, Polyneices, Antigone, and Ismene. A pestilence fell upon the land, that should only cease, said the oracle, on the expulsion of Laius' murderer. Him, with tragic irony, *O.* solemnly cursed, and straightway learnt from the seer Teiresias that he was himself the man. Thereupon Jocaste hanged herself and *O.* put out his eyes. There are varying traditions as to his later fate—one, that forthwith expelled by his son and brother-in-law Cleon, he fled with Antigone to Attica; another, that he was first imprisoned at Thebes, and only banished by Cleon after his sons had fallen by one another's hands, and that coming to Colonus in Attica, he was honourably received by Theseus and finally translated from this earth by the Eumenides. The myth of *O.* and his descendants has formed the theme of tragedies by Æschylus, Sophocles, Euripides, Seneca, Corneille, and Voltaire. By comparative mythologists *O.* has been compared with Indra, the slayer of Dahanā and the Night who gave him birth, and the Sphinx with Python or Fafnir, the winter dragon of Northern mythology. See Schneidewin's *Die Sage vom Œ.* (Gött. 1852); and Breal's *Le Mythe d'Œdipe* (Par. 1863).

Øhlenschläger, Adam Gottlob, the prince of Danish poets, was born 14th November 1779 at Vesterbro, near Copenhagen, where his father was steward of the king's summer palace. Forsaking the stage, which he had first chosen as a profession, he spent his twentieth year in the study of law under A. S. Oersted, and during the attack on Copenhagen by the English fleet under Nelson, 2d April 1801, served as an ensign in the student-corps. From this time he mainly devoted himself to the study of the literatures and languages of Scandinavia. In 1803 *O.* gave the first evidence of his genius in a collection of *Digte* (Copenh.), which were followed in 1805 by *Poetiske Skrifter* (2 vols. *ibid.*), the latter containing the charming Eastern tale *Aladin* (Ger. trans. by U. Amst. 1808) and the tragedy *Hakon Jarl* (Eng. trans. by F. C. Lascelles, 1874). Aided by a royal stipend from the government, *O.* visited in 1805 Berlin, Dres-

den, Weimar, and other German cities, and made the acquaintance of Fichte, Schleiermacher, Wieland, Jean Paul, Tieck, and Goethe, and afterwards went to Paris, where he wrote his dramas, *Palnatoke* (Copenh. 1809) and *Axel og Valdborg* (*ibid.* 1810). After residing a few months with Mme. de Staël at Coppet, in Switzerland, he proceeded to Italy, where he wrote the drama *Corregio* (*ibid.* 1811; Eng. trans. by Theodore Martin, Lond. 1854). On his return to Copenhagen in 1809 *O.* was appointed professor of æsthetics at the university. The controversy between the new romantic school, which recognised *O.* as its leader, and the older spirit of classicism gradually now settled into a personal contest between Baggesen (q. v.) and *O.*, which lasted till the former left Denmark in 1820. To this period belong some of *O.*'s greatest poems, *Helge* (1814), *Hroars Saga* (1817), and *Nordens Guder* (1819), a cycle of ballads on the old Scandinavian gods, translated into English by W. E. Frye in 1845. In 1817-18 he went on a second tour through Germany and Italy, and published his impressions, *Reise fortalt i Breve til mit Hjem* (2 vols. Copenh.). He died at Copenhagen, 20th January 1850. In his later years *O.*'s renown filled all Scandinavia. To his countrymen his name was as precious as that of Goethe to the Germans, and his death was mourned as a national calamity. His dramas and poems are marked by originality and force of imagination; his lyrics are unsurpassed for harmony and sweetness. A collected edition of his *Tragedier* was published by himself (10 vols. 1831-38; *édition de luxe*, 10 vols. 1849), also of his *Digterværker* (10 vols. 1835; *édition de luxe*, 23 vols. 1851-52). *O.* executed a German translation (4 vols. Leips. 1822-23), of Holberg's *Comedies*, and twice issued German translations of his own works (18 vols. Breslau, 1829-30; and 21 vols. *ibid.* 1839), which include (vols. i. and ii.) an interesting autobiography. The first complete edition of his *Samlede Værker* (38 vols.) appeared 1848-52; the latter of these years also saw the publication of his *Lyriske Digte, Romancer, og Ballader*, in 5 vols. A complete critical edition of his *Poetiske Skrifter* was edited by Liebenberg (32 vols. Copenh. 1857-65). See *O.*'s *Lebenserinnerungen* (4 vols. Leips. 1850-1), and Deumier, *O., le Pote national du Danemark* (Par. 1854).

Œil-de-Bœuf (Fr. 'bull's eye'), a small round or oval window, gave name to an ante-chamber in Louis XIV.'s palace at Versailles, which communicated with the royal apartment by such an opening in the frieze. The name *fastes* or *contes de l'Œil-de-B.* was extended from the gossip of the courtiers in waiting to scandal generally.

Öland, an island in the Baltic, off the S.E. coast of Sweden, is separated from the mainland by the Kalmar Sound, which is about 10 miles broad. The island is 92 miles from *O.* Point in the N. to the Björnabben in the S., with an average breadth of 5 miles, and an area of 530 sq. miles. The land, which is but sparsely covered with soil, is chiefly used as pasture ground by the inhabitants, though crops are also grown to a small extent. Alum is obtained and manufactured in large quantities, and along the centre of the island, where there is a low ridge called the Alvar Hills, there are numerous windmills. The capital Borgholm (pop. 829) was founded in 1817 near the ruins of an old castle of that name. *O.* is chiefly inhabited along the western coast, which is skirted by the only highway that traverses the island. Pop. 45,000.

Oels, a town in the province of Silesia, Prussia, on the left bank of the Oelse, 16 miles N.E. of Breslau by rail. It has four churches, a synagogue, and a large castle with old fortifications. The manufacture of flax and cloth is carried on. Pop. (1875) 8856.

Œnanthic Acid ($C_7H_{14}O_6$) is one of the results of the destructive distillation of Castor Oil (q. v.). The corresponding aldehyd ($C_7H_{14}O$), or *ananthole*, also results from the same operation. If castor oil be distilled with caustic potash, the *œnanthic* compounds do not appear, but instead caprylic alcohol ($C_8H_{18}O$) is obtained. *Œnanthic* alcohol ($C_7H_{14}O$) belongs to the series of primary alcohols, the corresponding acids of which form the homologous series known as the *fatty acid series*.

Œnothe'ra, a genus of *Onagraceæ* (q. v.) principally consisting of herbaceous plants, with alternate leaves, large yellow, red, or purple flowers, petals four, stamens eight, ovary four-celled, capsule usually splitting when mature into four valves. There are fully 100 species, and, with the exception of one found in Tasmania, all are natives of America. *O. biennis*, or the

evening primrose, so called from its primrose-yellow flowers opening at sunset, is often seen in gardens; it has also escaped from cultivation or been accidentally introduced, and has established itself as a weed in various places. In Germany it is grown for the sake of its roots, which are used as a vegetable. Various other species from California and Oregon are also grown in gardens as ornamental out-door plants, e.g., *O. caespitosus*, with fragrant white flowers $3\frac{1}{2}$ inches across when expanded, and *O. grandiflora*, which is perhaps the largest flowered and prettiest member of the genus.

Oerebro, one of the wealthiest towns in Sweden, and capital of a län of the same name, is situated on the Svart-Elf where it enters the western end of the Hjelmars lake. It has a fine church, a beautiful council-house, before which stands the statue of the hero Engelbrecht, and an old castle founded by Birger Jarl on a small island. Carpets and woollen goods are the chief manufactures, and there are silver, copper, and iron mines in the neighbourhood. Formerly O. was of political importance, having on several occasions been chosen as the seat of government by the Swedish kings. Fifteen parliaments have been held here, at one of which, in 1540, the throne was declared hereditary, and at another, in 1814, Bernadotte was chosen king of Sweden. Pop. (1875) 10,193.

Oersted, Hans Christian, a celebrated Danish physicist, was born at Rudkjøbing, in the island of Langeland, August 14, 1777. He entered Copenhagen University in 1794, studied medicine and chemistry, and at the same time took a lively interest in poetry and the fine arts. In 1800 he became assistant to the Professor of Chemistry, and after several years spent in Holland, Germany, and Paris, which he visited as holder of a travelling scholarship, he was appointed in 1806 Professor of Physics in the University of Copenhagen. In 1819 he made the great discovery which has placed him among the first of experimental investigators—the discovery, namely, of the action of an electric current upon a magnet in its vicinity. It is the fundamental fact of electro-magnetism (see **ELECTRICITY**), which has since received such an impulse from Ampère and Faraday. The account of his discovery is given in a Latin essay, entitled *Experimenta circa Efficaciam Conflictus Electrici in Acum Magneticum* (1820). In 1829 he became director of the Polytechnic Institute and the Magnetic Observatory. He was an honorary member of most of the scientific societies, receiving from the Royal Society of London and Institute of Paris the Copley Medal and the mathematical prize respectively for his great electro-magnetic discovery. His constant endeavour was to bring science within the reach of the people, and to this end he published numerous works, of which may be mentioned *Ansicht der Chemische Naturgesetze* (1812); *Naturlærens Mechaniske Deel* (1844); *Aandens i Naturen* (1850, Eng. trans. in Bohn's 'Scientific Library'); *Die Naturwissenschaft in ihrem Verhältnisse zur Dichtkunst und Religion* (1850); *Die Naturwissenschaft und die Geistesbildung* (1850). Most of his works are translated into German, and he himself wrote both German and French with great facility, as evidenced by his memoirs in Poggenдорff's *Annalen*. O. died at Copenhagen, March 9, 1851. See Möller, *O's Charakter und Leben* (1851), and a biography by Hauch and Forchhammer (German translation, 1853).

Oesel, an island of Russia in the Baltic, forming part of the government of Livonia, and stretching across the entrance of the Bay of Riga. It is 45 miles long with an average breadth of 25 miles. Area 1200 sq. miles; pop. 46,000. The soil is rocky; but in some places grain is raised and good pasture land obtained. Seal fisheries are also carried on. The only town is Arensburg (3378) on the S.E. coast. O. anciently belonged to the Danes, by whom it was ceded to Sweden in 1645. In 1721 it finally came into the possession of Russia along with Livonia.

Oesophagus (Gr. 'the food-passageway') is the name given to the 'gullet' or canal extending from the *pharynx*, or back part of the mouth to the *Stomach* (q. v.). In shape the O. is almost cylindrical, and in length it measures from 9 to 10 inches. Its upper level in the neck corresponds to the body of the sixth cervical vertebra. It enters and passes through the thorax or chest-cavity, pierces the *diaphragm* or *midriff*, and merges into the stomach, close below the latter muscle. In structure the gullet is composed of three layers. The external layer is the *muscular coat*, which is itself divided into an external and

internal portion. The external muscles of the O. run longitudinally, the internal fibres being circular. The *submucous coat* forms the middle layer of the gullet, and consists of bundles of white fibrous tissue intermingled with elastic fibres, and supporting nerves and bloodvessels. The former are given off from the pneumogastric trunks, and the latter from the inferior thyroid artery, the thoracic aorta, and the coronary artery of the stomach. The *mucous coat* lines the interior of the gullet. When the gullet is at rest, this coat exhibits longitudinal *rugæ* or folds. This layer is lined by a thick layer of *squamous* or *pavement epithelium*, whilst papillæ project from its surface, and small *racemose* (mucous) *glands* open on the internal surface of the tube. The deep layer of this mucous coat consists of unstriped muscular fibres arranged longitudinally, this layer being named the *muscularis mucosa*.

Diseases of the O.—This portion of the alimentary canal is liable to a considerable number of morbid changes, and all the diseases thereof have a tendency to occlude its passage, and hence are commonly described as *strictures* of it. *Œsophagitis*, or inflammation of the *oesophagus*, may be idiopathic, but it is generally caused by hot, irritating, or caustic substances, and sometimes by direct violence. Stricture of the *oesophagus*, one of the most terrible diseases with which man is afflicted, may occur as the result of several distinct conditions; folds of the mucous membrane, cicatrices after injury, pressure occasioned by neighbouring tumours, thickening or contraction of its walls, or lastly, and most frequently, cancerous affections of the tube. The symptoms of stricture of the *oesophagus* are dysphagia and emaciation, but it is often difficult to distinguish the various forms from each other. The malignant differs from the innocent by generally occurring later in life; by the general cachexia; by the implication of the glands of the neck, the larynx, and neighbouring organs. Obstruction from a tumour is generally caused by aneurism of the aorta. The seat of the stricture may be ascertained by passing a bougie, and if it be cicatricial the cicatrix may be divided by either external or internal incision. Billroth has attempted the extirpation of a cancerous deposit in the *oesophagus*, but the operation is not usually regarded as justifiable. The passage may sometimes be kept open by means of bougies, and failing this, no means of support can be introduced into the stomach except by the operation of *Gastrotomy* (q. v.).

Spasmodic stricture of the *oesophagus* usually occurs in hysterical women. The dysphagia in such cases is not constant, and frequently there is less difficulty in taking solids than fluids. Sir J. Paget has pointed out that the difficulty of swallowing may in many of these cases be analogous to that in stammering, viz., an inability from mental causes to co-ordinate the various muscular actions which are necessary to deglutition. Such cases require judicious management more than medical or surgical treatment. It occasionally happens that there is a congenital defect of the *oesophagus*, the tube contracting into an impervious muscular cord, or terminating in a *cul-de-sac*. In such cases, the child dies from inanition in from the third to the twelfth day.

Foreign bodies in the *oesophagus* are frequently a cause of trouble and pain, and often of great danger. A pin, a small bone, or a bristle may be hidden behind the arches of the fauces, or at the upper part of the pharynx. Large bodies are generally arrested opposite the cricoid cartilage, but they may pass lower. When a large mass rests above the pharyngeal opening of the larynx, it must be displaced at once, or instant death results; but when lodged in the *oesophagus* there is no such urgent danger. The first point is to ascertain, as nearly as may be, the size and shape of the substance impacted and its position in the gullet, so as to determine whether it should be pushed down into the stomach or extracted. Extraction may be accomplished with the long *oesophagus* forceps, by a blunt hook at the end of a probang, or by the horse-hair probang. This instrument contains a skein of horse-hair inserted near its extremity, which is dilated by pulling its handle out. It is useful for extracting foreign bodies, such as coins, bones, &c., which are lodged but do not entirely obstruct the tube. There are certain cases, however, in which it is necessary to cut down on the foreign body and remove it at once.

Œstridæ, a family of *Diptera* (q. v.) or Flies, including the 'bot,' or 'breeze-flies.' The body is stout and hairy, the mouth-opening small, and the mouth-organs rudimentary. The larvæ are thick, fleshy, footless grubs, composed of eleven segments.

The O. deposit their larvæ under the skin, or within the bodies of animals—the 'sheep bot-fly' (*Strutius ovis*) depositing her larvæ within the sinuses or spaces in the frontal bone of the sheep, to which it gains access through the nostrils. *Gastrophilus equi* or horse bot-fly, is of pale yellow colour, banded with black on the chest. Its eggs, deposited on the skin of the horse, are licked off by that animal, and live within the horse's stomach and intestines from May till October, when they are ejected along with fecal matter. *Hypoderma bovis* or ox bot-fly, has larvæ which live in the *worms* or tumours found in the backs of cattle.

Offa, King of Mercia, began to reign about 757 A.D. He immediately set himself to deal with the troublesome Welsh on his western border, beating them back from Hereford, and forcing the King of Powys from his capital, which changed its name from Pengwern to Scrobbesbyrig ('the town in the scrub'; mod. Shrewsbury). This position he maintained by planting settlements of English in the basin of the Severn. He likewise asserted his lordship over Kent and Wessex, and raised Mercia to a position of such importance as to incur the serious jealousy of Karl the Great, by whose intrigues, when O. died in 795, it was speedily reduced to insignificance. O. was a skilful soldier and a wise king, as the code of Mercian laws which bears his name testifies; but tradition lays to his charge some acts of revolting cruelty. See *Green's History of the English People* (new and enlarged ed. 1877).

Offa's Dike was a ditch and rampart extending from the mouth of the Dee to that of the Severn, built by Offa, King of Mercia, for the purpose of confining the marauding Welsh within their own country.

Offenbach, a town of Hessen-Darmstadt, Germany, lies in a level district on the left bank of the Main, and is connected with Hanau, Frankfurt, Mainz, and Darmstadt by rail. It contains an old castle, 5 churches, and 1 synagogue. The important industries of O., which owe their growth largely to the influence of French emigration, embrace the manufacture of machinery, cast-iron and plated goods, jewellery, chemicals, carriages, wax-cloth, leather, tobacco, hats, &c. Pop. (1875) 26,008.

Offenbach, Jacques, a popular composer of light music, born of a Jewish family at Köln, 20th July 1822, studied music at the Paris Conservatoire, and became leader of the orchestra at the Théâtre Français in 1847. In 1855 he undertook the management of the *Théâtre des Bouffes Parisiens*. His *Orphée aux Enfers* (1859) was an unbounded success, and is in many respects his best work. On its revival under his management with additional music at the Gaiété in 1874 it ran for 500 nights. His very numerous operas-bouffes include *La Belle Hélène* (1864), *Barbe Bleue* (1866), the enormously popular *Grande Duchesse* (1867), *La Perichole* (1868), *Les Brigands* (1869), *Genevieve de Brabant*, *Le Roi Carotte* (1872), *La Jolie Parfumeuse* (1873), *Bagatelle* (1874), *Le Voyage dans la Lune* (1875), and *Madame l'Archiduc* (1876), most of which have obtained high popularity in this country as well as in France. Though he has never attempted high art, he cannot be denied the possession of an inexhaustible fund of sparkling and graceful melody.

Offer and Promise. An offer is not binding on him who makes it until it is accepted. A promise is not binding on the promiser by English law unless given for a valuable consideration. By the Statute of Frauds no verbal promise is sufficient to ground an action, without at least some note or memorandum of the matter signed by the promiser, or by some one authorised by him, in the following cases: where an executor or administrator promises to meet out of his own estate a claim for damage on the estate for which he is executor or administrator; when a man undertakes to answer for the debt, default, or miscarriage of another, and in this case even a written promise was formerly void, unless a good consideration was specified in the writing, but this was altered by 19 & 20 V. c. 97; when an agreement is made in consideration of marriage; where any contract or sale is made of lands, tenements, hereditaments, or of any interest in these; and when there is any agreement that is not to be fulfilled within a year from the date of entering into it. The statute requires not merely that the bare promise be in writing, but that the terms of the contract and the consideration be stated in writing. The third clause does not include *mutual* promises to marry. An offer may, in ordinary cases, be accepted

at any time, if not withdrawn, unless a time be specified for acceptance. But in mercantile affairs there is an implied condition in an offer to buy or sell, that it be accepted without undue delay. An offer bearing that an answer is expected in course of post is not binding after the arrival of that post without an acceptance. In Scotland a promise is binding on the promiser though given without consideration, if deliberately and seriously made. See **MARRIAGE LAW**. Suppose A offer to sell B anything, say a horse, at a given price, and B promises to consider for a specified time, or to examine the horse on a given day, and A sells the horse while B is considering, or before he has examined the horse, it seems that by English law A is entitled to sell because he has had no legal consideration for waiting, in Scotland he would have been bound to wait. See **CONTRACT**.

Offering. See **FIRST-FRUIT** and **SACRIFICE**.

Offertory (Lat. *Offertorium*), is that part of the Eucharistic service in which the people make their offerings to God. In the ancient Church it was the practice for all communicants who had the means to make oblations of bread and wine, and sometimes other things, at the altar, out of which the elements for the Eucharist were taken, the surplus being devoted to a common feast (cf. 1 Cor. xi. 21), and at a later time to the support of the poor and the clergy. As soon as the people's offerings were made, and bread and wine were set apart for the Eucharist, an elaborate service followed, which is described in the Apostolic Constitutions. After thanksgiving to God for all His mercies, and particularly for the redemption of mankind by Christ, a form of Consecration was used, consisting of the words of the institution, with prayers that God would send His Holy Spirit upon the gifts and make them become the body and blood of Christ, and 'would receive the gift that was then offered to him to his altar in heaven, as a sweet-smelling savour, by the mediation of his Christ.' In the Anglican Liturgy the O. begins with the verses appointed to be read while the alms are being collected. The prayer offered in presenting the alms is sometimes called the first or lesser oblation, and the prayer of self-consecration after receiving the Eucharist, the second or greater.

Office (Lat. *Officium*), in the early Church, like Mass (q. v.), order, &c., meant divine worship and also the book containing the method for the regular performance of it. O. is thus the form of divine service appointed in the Breviary (q. v.) to be used daily as distinguished from the Liturgy (q. v.); that is, the Psalms, Lessons, Prayers, and Hymns which form the Canonical Hours (q. v.).

Officers, Military and Naval. Descriptions of the various grades of officers in Her Majesty's service will be found under their respective headings. Officers enter the army as sub-lieutenants under various regulations and subject to certain examinations, and obtain promotions in consideration of services and the passing of examinations. The combatant officers in a regiment consist of sub-lieutenants, lieutenants, captains, majors, lieutenant-colonels, and colonels, the last three being field-officers. The highest rank in the British army is that of field-marshal, next to which come various grades of generals. Non-combatant officers include paymasters, surgeon-majors, surgeons, and veterinary surgeons. The principal classes of officers in the navy are sub-lieutenants, lieutenants, commanders, captains, and the three ranks of admirals. Boatswains, carpenters, and gunners (warrant officers); and a superior class of artificers and seamen (known as petty officers) corresponding somewhat to non-commissioned officers in the army.

Offices, Sale of Public. The buying or selling of public offices has been considered as an offence indictable at common law. By 5 & 6 E. c. 16, if any person bargain to sell any office in the administration of justice, or of the public revenue, he loses his right of nomination to that office. And the person offering to purchase the office is disqualified from holding it. The Act did not extend to the sale of commissions in the army for prices fixed by the Queen's regulations. Its provisions have been extended to Scotland and to Ireland, and to all offices in the gift of the Crown, and to the principal offices of any department of the Government in the United Kingdom and in the Colonies, by 49 G. III. c. 126.

Official Assignee. See **BANKRUPTCY**.

Official Plants (Lat. *officina*, 'a shop'), are those plants which have a place in the pharmacopœia, and are therefore sold by apothecaries and druggists. Many medicinal plants have similar properties, but only those which appear in the pharmacopœias are called O. P. See MEDICINAL PLANTS.

Offset, or **Set-off**, in Architecture, the part of a wall left bare when the portion above it suddenly diminishes in thickness. Offsets are sometimes covered by projecting mouldings. In classical architecture they are horizontal and plain, in Gothic they slope and have a projecting drip.

Offsets, in Surveying (q. v.), are perpendicular to the chord of an arc or to the longest base of a polygon from points in the arc or from the corners of the polygon. By this means the areas of the jutting or irregular portions of a field are computed with sufficient approximation for practical purposes.

Ogam, the general name of the alphabet employed in their inscriptions by the Celts of Great Britain and Ireland, which, as given in medieval Irish MSS., runs thus:—

Here the continuous line indicates the edge of the stone on which the inscription was engraved, and the vowel marks should strictly be represented by mere notches. There were various special names for the Ogmic alphabet, as the Bethluisiun, in which the twenty letters were named after trees and shrubs (*beth*, 'birch' = *b*; *luis*, 'mountain ash' = *l*; &c.), or the Belloth alphabet, where they are called after Biblical names. O itself may probably be connected with a mythical character, *Ogyrven* (Cym. 'evil spirit'), the literal counterpart of the Zend *Ahriman*, and suggests the awe with which the ignorant multitude regarded the clerical knowledge of the learned few. There is nothing, however, to lead us to suppose that the O. was ever a cryptic alphabet, except perhaps in its last days, when it may have fallen into the hands of those who, like Glendower, were 'profited in strange concealments.' Ogmic monuments are commonest in Ireland, there being seventy-five in Kerry, forty-two in Cork, twenty-six in Waterford, and twelve in the rest of Ireland. There are twenty in S. and one in N. Wales, two in Devonshire, and one in Cornwall. Others have also been found in Scotland, especially in the counties of Fife, Aberdeen, and Sutherland, and in the Shetland Isles; but these have hitherto defied interpretation, and may prove to be not of Celtic, but Teutonic origin. Roughly speaking, the extant Ogmic monuments may be said to range from a date anterior to the departure of the Romans down to the close of the 9th c. The O. alphabet must, however, have been in use some time before the coming of the Romans, as its characters present no traces of Latin influence, and it is inconceivable that so clumsy a system should have been introduced with a better already to hand. Of all the Ogams the Welsh are the most valuable, nineteen out of twenty-one of them being accompanied by a Latin legend, whilst in Ireland this is the case with only two. The Welsh also are as a rule more legible, and it is easier to fix their approximate dates. The vexed question of the history of Ogams is left an open one by Mr. Rhys, the latest and ablest writer on the subject. He inclines, however, to the opinion that the Irish received the Ogmic alphabet from the Welsh, and the latter from the Teutons. 'It is,' he says, 'of a double origin, forming a sort of compromise between the East and the West. The characters used are European, and traceable to the quaternary period, the same may probably be said of the direction of the writing from left to right. The order of the letters, on the other hand, and some of their names, admit of being traced to a Phœnician origin.' See *Transactions of the Royal Irish Academy*; *Journal of the Kilkenny Archaeological Society*; Stuart, *Sculptured Stones of Scotland*, *Archæologia Cambrensis*; and Rhys, *Lectures on Welsh Philology* (Lond. 1877). Professor Westwood is at present preparing a work, *Lapidarium Wallie*, on the Ogams of Wales.

Ogdensburg, a city of New York, U.S., on the Oswegatchie River, where it falls into the St. Lawrence, 72 miles below Lake

Ontario, is the headquarters of the Northern Transportation Company's steamers plying between Chicago and intermediate lake ports, and is on the Central Vermont railway. It has considerable commerce, and possesses six churches, three parks, and three newspapers. Pop. (1870) 10,076.

Ogee (Fr. *ogive*), a moulding identical with the *cyma reversa* (see MOULDINGS). An O. arch is one in which the sides are formed of ogival curves; it is common in decorated Gothic.

Oglethorpe, General James Edward, a distinguished English soldier, was born at London, 22d December 1696. He entered the army in 1710, and served some time under Prince Eugene and Marlborough. In 1722 he represented Haslemere in Parliament, but having obtained a charter for the foundation of Georgia, he sailed for America in 1733. Two years after he revisited England, but returned in 1735 with John and Charles Wesley to Savannah, which he had founded two years previously. From 1737 to 1742 he commanded in Carolina and Georgia a regiment which he had brought over from Britain. Having returned to England in 1743, he served as major-general against the Pretender in 1745. In 1765 he became general and retired upon half-pay. O. died at Cranham Hall, Essex, 30th June 1785. See his *Life*, by Robert Wright (Lond. 1867).

Ogovai, one of the largest rivers of W. Africa, flows into the Atlantic at Cape Lopez by several widely separated mouths, the largest of which are known as the Fernand Vas, the Mexian, and the Nazareth. Formerly these were all regarded as distinct rivers, Du Chaillu having first ascertained them to be merely branches of the O. About 140 miles from its mouth occurs the junction of the two streams by which it is formed, the Okanda, the larger, flowing almost direct from E. to W., with a breadth varying from 100 yards to 1 mile, and the Ngunié, coming from the S.E. The latter was explored for some distance by Du Chaillu in 1864, and in 1872 Walker followed the main stream Okanda as far as the village of Lope, when he discovered the existence of a long series of rapids, which check navigation for a considerable distance, and are caused by the descent of the river through the Okeko mountains from the elevated plateaus of the interior. In 1874 the French travellers Marche and Compiegne passed these rapids, penetrating up the Okanda a distance of 200 miles from its confluence with the Ngunié, 80 miles farther than Walker, where they reached the mouth of a large affluent named the Ivindo. Here, according to the assertions of the Okanda natives, they were only four days' journey from the great lakes from which the river takes its rise, when hostile attacks by the Osyeba tribes forced them reluctantly to return. In 1876 attempts in the same direction were made by Savorgnan de Brazza and Dr. Oskar Lenz, but though these travellers made some further progress the sources of the O. still remain unexplored. See *Proceedings of the R. Geog. Soc. of Lond.* for 1873, No. v. p. 354; Petemann's *Mittheilungen* for 1874, No. xi. p. 425; *Ibid.* for 1877, No. i. p. 40.

Ogyges, in Greek legend, is variously described as king of the Hecenes, a Boeotian autochthon, and the first ruler of the Theban territory—hence called Ogygia—in whose reign Lake Copais flooded the valley of Boeotia. The Athenians, again, connected him with Attica; Strabo calls him the last of the Achaian monarchs; and some traditions even make him a king of Egypt.

Ogygia, a genus of Trilobites (q. v.), the species of which are found exclusively as fossils in the Lower Silurian rocks and in the Llandeilo flags of that period.

Ohi'o, an inland State of the American Union, is bounded N. by Michigan and Lake Erie, E. by Pennsylvania and West Virginia, S. by West Virginia and Kentucky, from which it is separated by Ohio River, and W. by Indiana. Area, 39,964 sq. miles; pop. (1870) 2,665,260, of whom 63,213 were coloured, and 100 Indians. The greater part of the State consists of tableland 1000 feet above the sea-level, rising to 1400 feet at the watershed between the basins of the O. River and Lake Erie. The lake-shore is 230 miles in extent, but has few indentations, the principal harbours being in Cleveland, Sandusky, and Maumee Bays. Sandusky Bay, the largest of these, extends 20 miles inland, and contains several islands. The chief rivers are the Ohio, which has a navigable course of 436 miles along the S.

and S. E. boundaries, and its northern tributaries the Mahoning, Muskingum, Scioto, and Great Miami. The Maumee is the only navigable river flowing into Lake Erie. The geological formations belong to the Paleozoic period, and include, besides sandstone, limestone, and shales, a portion of the great Appalachian coal-field, which occupies one-third of the area of the State. The aggregate thickness of all the workable beds of coal is estimated at about 50 feet, and the product in 1874 was nearly 5,000,000 tons. The principal other minerals are iron (mined annually to the extent of 340,000 tons), salt, petroleum, and lime. Fifty years ago four-fifths of the surface of the State were covered with forest; now there is little more than one-fifth, the principal trees being the oak, ash, beech, poplar, and maple. O. is one of the most important States for cereals and fruit. In 1874 the produce of Indian corn was 101,815,494 bushels; of wheat, 26,896,818; of oats, 19,557,014; of barley, 1,233,934; of buckwheat, 240,015; of rye, 235,435; of potatoes, 7,348,907; of apples, 15,918,974; of peaches, 2,235,574; of tobacco, 9,245,520 lbs.; of maple sugar, 1,248,955; of grapes, 17,965,604; of butter, 44,335,657; of cheese, 33,123,880; of wool, 16,684,276, and of hay, 1,508,385 tons. The value of all farm produce in 1874 was \$198,256,907. The live-stock comprised 738,839 horses, 894,700 oxen, 778,500 milch cows, 4,333,868 sheep, and 1,778,399 swine—total value of live-stock, \$130,148,655. The State of O. ranks fourth in the amount of its manufactures. In 1870 the capital invested was \$141,923,964, and the value of the annual produce \$269,733,610. The principal manufactures are iron, machinery, farm implements, flour, tobacco, malt liquors, and clothing. The export of white fish, lake trout, &c., from the harbours on Lake Erie amounts to \$1,500,000 yearly. In 1876 there were 5650 miles of railway, and 736 of canals. Columbus is the capital, but Cincinnati the chief city of the State; other large towns are Cleveland, Toledo, and Dayton. The territory of O. was first explored by the French under La Salle, but no actual settlement was made in it till 1788, when a colony from New England founded Marietta and Cincinnati. In 1802 O. was admitted into the Union. The battle of Lake Erie, in which the British were defeated by Commodore Perry, was fought at Putin Bay, September 10, 1813. Since then the history of the State has been one of continuous and steadily growing prosperity.

Ohio River (formerly 'La Belle Rivière'), the largest affluent of the Mississippi in respect of volume, is formed at Pittsburgh, Pennsylvania, by the confluence of the Alleghany and Monongahela, the former of which rises in Pennsylvania, the latter in W. Virginia. It flows first S., between the States of Ohio and W. Virginia, then W., between Ohio and Kentucky, and finally S.W., separating Kentucky from Indiana and Illinois, falling into the Mississippi at Cairo, after a course of 975 miles from Pittsburgh, and of 1265 from its source. Its chief tributaries from the right are the Scioto, Miami, and Wabash; from the left, the Kanawha, Big Sandy, Kentucky, Cumberland, and Tennessee. With its affluents it possesses 5000 miles of navigable waters, though in the upper part of its course it is generally frozen during one month of the year. The only important rapids are at Louisville, Kentucky. The basin of the O. is 202,400 sq. miles.

Ohio Wesleyan University, at Delaware, in the State of Ohio, was founded in 1843. Besides the president, there is a staff of 8 professors, 2 tutors, and a principal of the preparatory department. During the session 1872-73 there were 145 classical students, 28 scientific, 23 unclassified, 180 preparatory, and 46 in the graduating class. The University possesses a well-furnished laboratory, the Prescott collection of specimens in natural history, and the Mann cabinet of geological specimens.

Ohlau, a town of Prussia, in the province of Silesia, between the rivers O. and Oder, which unite at Breslau, 16 miles N.W. by the Upper Silesian Railway. It has a large old castle and manufactures of tobacco, cigars, machinery, &c. Pop. (1875) 7963.

Ohm, Georg Simon, a German mathematician and physicist, was born at Erlangen, March 16, 1787. He was first teacher of mathematics in Nidau (Bern), and then in succession at

Neuschâtel, at Bamberg (1815), at Cologne (1817), and at the Berlin *Kriegsschule* (1826). In 1833 he became professor and director of the Nürnberg Polytechnic School, and in 1849 was elected Professor of Physics in the University of Munich, where he died July 6, 1854. He wrote *Die Galvanische Kette* (1827; Eng. trans. in Taylor's *Scientific Memoirs*, Lond. 1841, vol. xi.); *Beiträge zur Molecular Physik* (1849), and *Grundsätze der Physik* (1853). His fame rests, however, upon the enunciation of the law bearing his name, which gives the intensity of a current in terms of the electromotive force and the total resistance of the circuit. See OHM'S LAW.—**Martin O.**, brother of the preceding, was born at Erlangen, May 6, 1792, and died Professor of Mathematics at Berlin, 1st April 1872. His best known works are *Versuch eines Vollkommen Consequenten Systems der Mathematik* (9 vols. Nürnberg, 1822-52), and *Geist der Mathematischen Analysis* (2 vols. 1842-45).

Ohm's Law, a fundamental law of current electricity, which rests solely for its truth upon experiment, and has been deduced from no simple hypothesis. If I be the intensity of a current due to an electromotive force or difference of potential E in a circuit whose total resistance, including the resistance of the battery and connections, is R —then Ohm's law states that $I = E \div R$. See ELECTRICITY.

Oidium, a genus of naked-spored fungi, of which in Britain there are nine species occurring on rotten wood, fruits, and, in the case of *O. concentricum*, upon the leaves of various plants. The name has been brought into notoriety from the vine mildew being classed as an O., although subsequent investigation shows it to be the early state of some *Erysiphe*, of which the perfect plant still remains unrecognised. The first notice of the pest, recent as 1845, was made by Edward Tucker, a gardener at Margate—from him the plant was called *O. Tuckeri*. In the course of a few years it was found in France, and made its way up the Mediterranean. In 1853 it appeared in Spain, reducing the Cadiz exports of wine from 70,000 to 18,000 butts, and increasing the price from £7 to £16 per butt. A year later it worked destruction in Portugal, whilst in Madeira it had by this time almost annihilated the grape crop. A damp stagnant atmosphere favours its development, and it attacks vines in all stages of growth. Generally it seizes on the leaves first, looking like a small speck of mould similar to that which appears on decayed fruit. These specks very soon multiply, and increase in size until the leaf is entirely covered, but before this stage is reached, the berries are generally affected, the part showing a small brown spot and decaying. Liberal dusting of flowers of sulphur is the most effectual remedy, and if applied in time will save all. Machines are manufactured to distribute the sulphur. If young vines are propagated from wood which has been affected with the mildew, it appears on them immediately they begin to grow.

Oil Beetle, a name given to beetles of the genus *Meloe*, and specially to the *M. violaceus*, a common British species, which has the power of exuding a yellowish fluid of oily matter from between the joints of its legs. The colour of the beetle is a dull indigo or metallic blue.

Oil-Cake is the solid residue from the extraction of oil from various seeds. As the cake retains a certain proportion of oily matter, and the whole of the nitrogenous and other essential constituents, such as are suitable for cattle-feeding purposes, it possesses high nutritive value. Oil-cakes prepared from linseed, rape, poppy seed, mustard seed, cotton seed, gold of pleasure seed, and palm-nut, are met with in commerce, but of these the linseed cake is by far the most important and valuable, next to which come rape, cotton, and palm cakes. English linseed cake is esteemed the best, and the following represents the mean of several analysis of that variety: albuminoids, 28.56; oil, 13.52; water, 8.60; ash, 7.27 per cent. Rape cake is apt to become rancid and develop a flavour which is disliked by cattle, but does not appear to be disagreeable to sheep. A large amount of cotton seed cake is imported from the United States, and palm-nut cake and meal have now become important feeding stuffs. The imports of O.-C. into Great Britain during 1876 amounted to 190,218 tons, of a value of £1,768,231, the greater part of which was American cotton seed cake.

Oil-Cloth. See FLOOR-CLOTH.

Oil-Mill. See OILS.

Oil of Mustard is a pungent volatile oil containing sulphur, and having the composition C_4H_9NS . It is prepared by distillation of the seeds of black mustard (see **MUSTARD**), after they have been crushed and moistened. Its presence is at once indicated by its peculiar odour.

Oil Palm (*Elæis*), a genus of wing-leaved *Palmaceæ*, of which *E. Guineensis* yields the palm oil of commerce. It is an abundant native of tropical Western Africa, the oil forming the chief export of the ports in the Bight of Benin, Liberia, and Bonny River. The palm is a low-growing species, but is of great longevity. The fruits from which the oil is obtained are borne in dense heads or spadices, sometimes two feet long and two or more feet in circumference, the fruits themselves being each about an inch and a half long, and an inch in diameter. The seeds are enclosed in a very hard bony shell, which is covered with a softish pulpy substance, outwardly, when ripe, of a bright orange or yellow colour. It is from this outer fleshy portion of the fruit that the best oil is obtained. The fruits are boiled by women in large earthenware pots, after which they are crushed in mortars. They are then placed in large clay vats filled with water, and women tread out the oil, which immediately comes to the surface, when it is collected and again boiled to throw off the water, after which it is placed in barrels or casks for exportation. Good palm oil is of a bright orange or deep yellow colour, about the consistency of butter, and when fresh has an agreeable smell. It is now most extensively used in the manufacture of soap and candles, and also for greasing the axles of railway carriage wheels. In Africa the solid oil is used for culinary purposes, often in place of butter, and the hard seeds are made into various ornamental articles. The other species of the genus is *E. melanococca*, a native of South America. It is not, however, of any economic or commercial value.

Oil-Refining. See OILS.

Oils (including **Fats**). The term oil was originally applied to all fluid substances of whatever nature, which flowed with a certain degree of viscosity, as for example oil of vitriol, a name by which commercial sulphuric acid is still known. The term continues to be popularly applied to several distinct classes of substances which, beyond inflammability, and being compounds of carbon, hydrogen, and oxygen, have very little in common. Thus under the general head of O. are included (1) fixed O., (2) essential or volatile O., and (3) mineral or paraffin O. It is only with the first of these, the fixed O., that we have here to do. See **ESSENTIAL OILS**; and for mineral or paraffin O., see **NAPIHTHA**, **PARAFFIN**, and **PETROLEUM**.

Fixed O., from which the fats are only distinguished by being solid at ordinary atmospheric temperatures—the one series passing into the other by insensible gradations—have the following physical properties in common. They are entirely insoluble in water, but dissolve perfectly in ether, and to some extent in warm alcohol; applied to paper they communicate a stain which is irremovable by heat; unlike the volatile O., they are not capable of distillation unchanged, but undergo destructive distillation on the application of high heat; they are all lighter than water, and in a pure condition they exhibit a neutral reaction. All natural O. and fats are chemical compounds of glycerine with certain organic acids, the chief of which are known as palmitic, stearic, oleic, and linoleic acids. These, as well as all the other fatty acids which occur less abundantly, are compounds of carbon, hydrogen, and oxygen, some being fluid at ordinary temperatures, e.g., oleic acid, and others forming solid white semi-crystalline bodies with an unctuous texture, of which stearic acid is an example. By the ordinary process of saponification as pursued in soap-making, the glycerine of the oil treated is separated from combination with the fatty acids; the *rationale* of the process being that a basic substance—soda or potash—having a more powerful affinity for the acids than glycerine is presented to them. Consequently the glycerine is separated, and new combinations between soda or potash and the fatty acids are formed which constitute ordinary Soaps (q. v.). According to their behaviour on exposure to air O. are separated into two classes—1st, drying O., and 2nd, non-drying or greasy O. The drying O., of which linseed oil is the most important example, on exposure to the air absorb oxygen, thicken at first to a transparent elastic mass, and ultimately form a hard varnish.

This property of drying is due to the fact that the fatty acid present in linseed and other drying O. is mainly linolein, a substance which in many respects approaches the gum resins in its behaviour. The non-drying O. also undergo changes in the presence of oxygen, but these are due to the presence of fermentable impurities in the O., whereby rancidity is induced, certain volatile fatty acids, as butyric, caproic, and valerianic acids, being evolved.

O. and fats are very generally disseminated in both the animal and vegetable kingdoms, being essential constituents of all the higher animals and of nearly all the more highly organised organs of plants, such as the seeds and fruits. The list of O. which are available in commerce is very extensive, although it only embraces the fatty products of a small proportion of the oil-producing animals or plants. Again, though the fatty matter in many animals or plants are not obtained in a separate form for use, they still play a most important part in almost all animal foods, and in many food substances of vegetable origin (see **FOOD**).

The industries connected with the collection of the raw materials and preparation of O. are necessarily of a most varied and diverse character, seeing the materials come from sources so widely different and in forms so various. The various O. and fats of any considerable industrial importance will be found noticed in detail under their respective headings; and here they may be classified as follows:—

1. O. and fats of animal origin, including—
 - a. Fish O. (so called).
 - b. Land animal fats and O.
 - c. Insect waxes.
2. Vegetable O. and fats, comprising—
 - a. Vegetable wax and fats.
 - b. Fluid O. (drying).
 - c. Do. (non-drying or greasy).

Of so-called fish O. the most important commercially is whale oil, obtained principally from the blubber or solid fatty matter which internally lines the skin of the great Greenland whale (*Balaena mysticetus*). Other species of whales yield also a similar oil which is not separately distinguished in commerce (see **WHALE**). Sperm oil is also the product of a species of whale (*Caodon macrocephalus*), being found in the head of the animal along with spermaceti, a solid waxy substance analogous to the fatty acids already mentioned. Seal oil, from its nature, source, and the methods by which it is obtained closely resembles whale oil. The only other fish oil of commercial importance is the cod oil or cod liver oil, obtained from the livers of various species of *Gadus* (see **COD LIVER OIL**).

Of other animal fats and O. the most important are tallow, the concrete fat obtained from ruminant mammals, and lard, the fat of hogs. From these solid fats a fluid oil is now obtained by pressure, which is extensively employed in soap making, and in oiling textile fibres, &c. Another animal oil of commerce is neats-foot oil, obtained, as the name indicates, from the feet of oxen. It does not solidify at the freezing point of water, and owing to its fluidity is employed for oiling fine machinery. From the yolk of eggs an oil is extracted in Russia which is there used in the manufacture of a variety of toilet soap held in peculiar esteem; but the manufacture is purely local. Butter (q. v.) is an animal fat of the first importance.

Beeswax is a substance analogous to solid animal fats. Pe la, a waxy substance obtained in China, is deposited by an insect (*Coccus ceriferus*) allied to the cochineal, on the twigs of the tree *Rhus succedaneum*. A similar product (*Ceros delas andaquies*) is found in the Orinoco Valley in Brazil.

Several solid fats on account of their hardness—some being firmer than beeswax—are known as vegetable wax. The principal of these are products of palm trees, natives of South America, the two chief being the wax of the wax palm, *Cereaxylon andicola*, Carnahuba wax, a similar product from *Corypha cerifera*. The wax exudes from the bark, and from the young leaf shoots of these trees. A similar wax is obtained from the fruits of various species of *Myrica*, chiefly from *M. cerifera* in the United States of America, and like the two preceding it can be profitably made into candles without any further preparation. From the milky exudation of the cow tree of South America, *Galactodendron utile*, a soft waxy substance is also isolated. In the province of Para, Brazil, a solid fat called ocuba wax is obtained from a species of wild nutmeg, and the ordinary nutmeg itself yields a solid fat—the butter of nutmegs.

A solid white 'butter' is extracted from cocoa seeds (*Theobroma cacao*), which at present finds its chief use in pharmacy. Of all the solid fats, probably that of greatest commercial importance is Palm Oil (q. v.). From the kernels of the common oil palm, which were formerly regarded as useless, valuable white fatty oil is now derived by heat and pressure. Next in importance to palm oil for soap and candle making is the coco palm oil expressed from the dried 'nuts' (copperah) of *Cocos nucifera*. From the fruits of various species of *Bassia* Shea butter is procured in India, and Galam butter on the west coast of Africa.

Drying O. pass by insensible gradations into the non-drying series, so that although the distinction between the extremes is obvious enough, there are many O. possessed of a certain amount of drying properties which may be used like the greasy O. and *vice versa*. Drying O. are mainly used for mixing painters' colours, the non-drying class being appropriated for illuminating and soap making purposes. The following is a list of the principal drying O.:

Name of Oil.	Plant Yielding Oil.	Sp. Grav.	Remarks.
Linseed Oil	<i>Linum usitatissimum</i>	0.9351	Seeds yield up to 22 per cent.
Nut Oil	<i>Corylus avellana</i>	0.9288	About 60 per cent. from kernel.
Walnut Oil	<i>Juglans regia</i>	0.9260	From 40 to 70 per cent. from kernel.
Poppy Oil	<i>Papaver somniferum</i>	0.9270	
Hemp Oil	<i>Cannabis sativus</i>	0.9307	Seeds yield 14 per cent. of oil.
Cucumber Oil	<i>Cucurbita</i> , Various Species	0.9231	Yield about 25 per cent.
Sunflower Oil	<i>Helianthus annuus</i>	0.9250	Yield about 25 per cent.
Tobacco-Seed Oil	Species of <i>Nicotiana</i>	0.9232	Yield about 31 per cent.
Grape-Seed Oil	<i>Vitis vinifera</i>	0.9202	Yield about 11 per cent.
Oil of Honesty	<i>Hesperis matronalis</i>	0.9232	
Camelina Oil	<i>Camelina sativa</i>	0.9252	Yield about 28 per cent.
Weld Oil	<i>Reseda luteola</i>	0.9358	From 29 to 36 per cent.
Cress Oil	<i>Lepidium sativum</i>	0.9240	Yield about 55 per cent.
Madia Oil	<i>Madia sativa</i>	0.9286	
Pine-Seed Oil	Various species of <i>Pinus</i> , <i>Abies</i> , etc.		
Cotton-Seed Oil	<i>Gossypium</i> , Various species of	0.9306	
Castor Oil	<i>Ricinus communis</i>	0.9639	Yield up to 62 per cent.
Croton Oil	<i>Croton tiglium</i>	0.94263	Used only medicinally.

Linseed oil and other drying O. are prepared for painters' use by boiling with litharge. The change thereby induced in the constitution of the O. appear to consist in the absorption of the ordinary oleic acid by the litharge to form an insoluble hard soap, and in the more or less complete decomposition of the glycerine, thus leaving a comparatively pure linolein or linoxin, which is quickly acted on by atmospheric influences.

Non-Drying O. are more numerous than the drying series, and a larger proportion are of commercial importance. The following list embraces the principal:—

Name of Oil.	Plant Yielding Oil.	Specific Gravity.	Remarks.
Olive Oil	<i>Olea Europea</i>	0.9170	Yield 32 p.c.
Almond Oil	<i>Amygdalus communis</i>	0.9184	" about 45 p.c.
Ben Oil	<i>Moringa pterygosperma</i>		
Apple-seed Oil	<i>Pyrus malus</i>		
Beech-nut Oil	<i>Fagus sylvatica</i>	0.9230	" about 16 p.c.
Oil from seed of	<i>Butea frondosa</i>	0.9170	
" "	<i>Calophyllum inophyllum</i>	0.9420	
" "	<i>Cannarium commune</i>		
Colza Oil	<i>Brassica campestris oleifera</i>	0.9136	" 39 p.c.
Oil of Cyperus	<i>Cyperus esculentus</i> (root)	0.9180	
Grass	<i>Prunus cerasus</i>	0.9239	" 33 p.c.
Cherry-stone Oil			
Cornel-berry Tree Oil	<i>Cornus sanguinea</i>	0.914 to 0.921	
Oil of Daphne	<i>Daphne mezereum</i>	0.9180	" 42-50 p.c.
Earth-Nut Oil	<i>Arachis hypogaea</i>	0.9220	
Ergot Oil	<i>Secale cornutum</i>	0.9230	
Henbane-seed Oil	<i>Hyoscyamus nigra</i>	0.9150	
Horse-Chestnut Oil	<i>Asculus hippocastanum</i>		
Laurel Oil	<i>Laurus nobilis</i>		
Mesua Oil	<i>Mesua ferrea</i>	0.9340	
Black Mustard Oil	<i>Sinapis nigra</i>	0.9210	

Name of Oil.	Plant yielding Oil.	Specific Gravity.	Remarks.
White Mustard Oil	<i>Sinapis alba</i>	0.9338	Yield ab. 30 p. c.
Oil from seed of	<i>Nigella sativa</i>	0.9200	
Oil from root and seed of	<i>Paris quadrifolia</i>	0.9350	
Parsley Oil	<i>Petroselinum sativum</i>	1.0780	" 33 p.c.
Plum-kernel Oil	<i>Prunus domestica</i>	0.9127	
Oil from seed of	<i>Pongamia glabra</i>	0.9150	
Summer Rape Oil	<i>Brassica præcox</i>	0.9155	" 33 p.c.
Winter Rape Oil	<i>Brassica napus</i>	0.9165	" 32 p.c.
Oil of Radish seed	<i>Raphanus sativus oleifera</i>	0.9187	
Sesamé or Teel Oil	<i>Sesamum orientale</i>	0.9241	" 46 p.c.
Spindle-Tree Oil	<i>Eunonymus Europæus</i>	0.9571	
Spurge Oil	<i>Euphorbia lathyris</i>	0.9261	" 30 p.c.
Oil from seed of	<i>Sterculia fatida</i>	0.9230	
Thea and Camellia Oils		0.9270	
Candle-Nut Oil	<i>Aleurites triloba</i>		
Oil from seed of	<i>Telfairia pedata</i>		

Extraction of Oil.—The O. contained in most seeds are extracted practically by the same mechanical means, with only a few modifications suited to the structure of the seeds and the condition of the oily product. Grinding of the seed, heating, and pressing, are the three main processes. For the first and finer portions of some O. the heating is omitted; but the cake resulting from cold pressure is in that case reground and pressed, with the application of heat, by which a further proportion of oil is obtained. The manufacturing process is conducted in oil-mills, of which there are two principal kinds—1st, the Dutch mill, in which the pressure is obtained in strong boxes by means of wedges driven in by cam stamps; and 2d, hydraulic mills, where the pressure is obtained by hydraulic presses. The hydraulic mills appear to be gradually superseding the older Dutch method.

A brief outline of the stages in the expression of linseed oil may be taken as a typical example of oil extraction. The seeds are first bruised by being passed through a hopper between a pair of heavy iron rollers, set horizontally close to each other. The bruised seed is next ground to a fine paste under a pair of heavy edge-rollers, which revolve in a shallow circular trough. If a fine cold-drawn oil is wanted, the paste is now filled into the flannel bag for pressure, but generally it is first heated in a steam-kettle. The flannel bags, filled with the material ready for pressure, are wrapped in horse-hair bags, and thus are ready for either the Dutch or the hydraulic press. The Dutch press consists of a strong cast-iron box in which two bags of seed are accommodated, each being placed between a pair of perforated iron plates. Against these a number of upright and oblique blocks are arranged, and between a pair of oblique blocks a wedge is inserted, the head of which is powerfully struck by a stamper falling on it. A means of unlocking the whole is secured by a spring or reverse wedge, which with a light tap falls down and frees the various blocks. The hydraulic press is generally used double, one side being under pressure while the other is being emptied and recharged. The bags are pressed between strong cast-iron plates, the oil exuding on all sides.

Refining of Oil.—Crude O. generally contain some proportion of mucilaginous and albuminoid substances, besides other impurities which render them turbid and liable to early rancidity. Several processes are pursued for freeing them from these impurities, most of them depending on the oxidation and consequent precipitation of the foreign substance. For some O., however, it is only necessary to employ simple filtration through newly-burned charcoal. In other cases the O. are mixed with hot water, or steam is forced through them, after which a flocculent deposit takes place, and a process of filtration is applied to the supernatant O. Menard's process consists in mixing the O. with 1 or 2 per cent. of strong sulphuric acid, which attacks the impurities and carries them down as a tarry sludge. Chromic acid, hypochlorous acid, and other oxidising agents are also used, and tannic acid is similarly employed, its action consisting in forming insoluble tannates with the impurities. A further process of bleaching is in some cases necessary, and that is best accomplished by the exposure of the O. to sunlight.

O. and fats form an essential feature in all diets, and are regarded as the chief force-producing constituents in human

food. In medicine, both internally and externally, several are of great use; and medicated O. are much employed for external application in various diseases. For preparing soaps, for burning in lamps, and for making into candles, the consumption of O. is of course enormous. Among other industrial applications may be mentioned the currying and dressing of leather, the lubrication of machinery, the oiling of flax and other fibres for spinning, the preparation of oil paints and varnishes, and the manufacture of ointments and plasters. Perfumed and other O. are also much used for the hair.

Exclusive of butter, and of the vast quantity of oil expressed from raw materials imported into or produced in the country, the following figures represent the imports of oil of Great Britain for 1876:—Train oil and blubber, 13,466 tuns, valued at £445,262; spermaceti head matter, 3218 tuns, of a value of £290,359; animal O. (neats'-foot, &c.), 26,914 cwt., value £62,515; castor-oil, 79,677 cwt., worth £133,838; cocoanut-oil, 199,431 cwt., valued at £377,480; olive-oil, 24,022 tuns, value £1,089,176; palm-oil, 879,824 cwt., worth £1,529,360; seed oil, 22,759 tuns, of a value of £811,421; and of oils unenumerated to the value of £145,504. The value of the tallow and lard imported was £4,454,891; and of seeds for oil extracting, £469,275. The greater part of the latter item is made up of palm seeds from the west coast of Africa, which formerly were regarded as waste and useless.

Oil- Wells and Trade. See NAPHTHA and PETROLEUM.

Ointments or Unguenta. Simple ointment is prepared by melting together, and stirring till cold 2 parts of white wax, 3 of almond oil, and 3 of lard. *Resinous* ointment is prepared by similarly treating 2 parts of resin in coarse powder, 1 part of yellow wax, and 4 of simple ointment. These O. may be regarded as the bases of all the O. of the British Pharmacopœia, the various medicinal substances being added. The following are the official O.:—viz., Ung. aconitiae, antimonii tartarati, atropiæ, belladonnæ, cadmii iodidi, cantharidis, cetacei, creasoti, elemi, gallæ, gallæ cum opio, hydrargyri, hydrargyri ammoniati, hydrargyri compositum, hydrargyri iodidi rubri, hydrargyri nitratis, hydrargyri oxidi rubri, hydrargyri subchloride, iodidi, picis liquidæ, plumbi acetati, plumbi carbonatis, plumbi iodidi, plumbi subacetatis compositum, potassæ sulphuratæ, potassii iodidi, resinæ, sabini, simplex, sulphuris, sulphuris iodidi, terebinthinæ, veratri, and zinci.

Oise (Esia), a river of France, tributary of the Seine, rises in the forest of Thiérache, in Belgium, within 3 miles of the French frontier, flows S.W., joining the Seine at Conflanz-Sainte-Honorine, after a course of 187 miles, 96 of which are navigable. About 2½ miles from Compiègne, it is joined by its chief tributary, the Aisne (q. v.). The O. is connected by canals with the Somme, the Sanibre, and the Scheldt, and forms an important means of communication between Paris and the N.

Oise, a department of northern France, extending along the Seine and Oise. Area, 2260 sq. miles; pop. (1872) 396,804. The surface is flat, and is watered by the Aisne, Therain, and other affluents of the Oise. Agriculture is in an advanced state, the soil being generally fertile. The chief products are cereals, wines and brandies, wood, coal, especially fruits and vegetables for the Paris markets. O. has manufactures of carpets, felt, tapestry, linens ('half-hollands'), leather, and cordage. The chief town is Beauvais; others are Compiègne, Clermont, Noyon, and Senlis.

Oiti (Mouguilea tomentosa), a Brazilian tree belonging to the sub-order *Chrysobalanacea* of *Rosaceæ*. The wood is very hard, and useful for shipbuilding purposes.

Oka, a river of Central Russia, tributary to the Volga, rises on the frontier of Orel, flows N. between banks 656 to 788 feet high through Kaluga, then E. forming the boundary between Moscow and Tula, then with great windings through Rjâsan, and finally N.E. through Vladimir and Nijni-Novgorod to the Volga, which it joins near the town of Nijni-Novgorod. Length, 929 miles; area of basin, 120,000 sq. miles. The stream is slow, without any rapids, but is covered with ice from November to March. The O. receives on the right the Upa (184 miles), the Pronja (120 miles), and the Zna (276 miles); on the left the Sidsra (115 miles), the Ugra (253 miles), the Moskwa (248½ miles), and the Kliasma (368 miles).

With its extensive network of watercourses, the O. forms for Central Russia a very important system of river communication.

Okecho'bee, the largest lake in the southern half of the United States, lies in the S. of Florida, and has a length of 40 and a breadth of 25 miles. Its area is 1200 sq. miles; its maximum depth only 12 feet. It is largely overgrown with weeds and grass, and is enclosed on all sides by an impenetrable swampy jungle. The Kissimee River is the largest stream which it receives, and its waters ooze out through the Everglades without forming anything that can be called a stream.

O'ken (properly **Oikenfuss**) **Lorenz,** a great German naturalist, was born at Bohlsbach near Offenburg, August 1, 1779. He studied at Würzburg and then at Göttingen, where he began his career as a *Privatdocent*. In 1807 he accepted the extraordinary professorship at Jena, and then made a wide reputation as a lecturer on natural science generally, including comparative anatomy and physiology. In 1812 he became ordinary professor of natural science; but this post he was forced to resign in 1819 in consequence of the opinions he expressed in the *Iris*, a semi-scientific, semi-political journal, which he conducted from 1817 to 1848. In 1827 he settled in Munich, and in the following year became professor in the newly established university. In 1832 he removed to a similar chair at Zürich, where he died August 11, 1851. He wrote *Lehrbuch der Naturphilosophie* (1808-11; Eng. trans. Lond. 1847), *Lehrbuch der Naturgeschichte* (3 vols. 1813-27), and *Allgemeine Naturgeschichte* (13 vols. 1833-41). His system of nature is a curious *a priori* philosophy, with a method of nomenclature totally unlike any that had preceded it. He was too much of a theorist and transcendentalist to find much favour among other naturalists; but he made some highly important discoveries in natural history. He was the first to conceive of the cell as the ultimate component of all animal tissues, and to suggest that the bones of the skull are merely modified vertebrae.

Okhotsk' Sea of, a large gulf of the N. Pacific Ocean, on the E. coast of Siberia, is bounded N. by the mainland, E. by the peninsula of Kamchatka, S. by the Kurile Islands, W. by the islands of Yezo and Sagalien, and communicates with the Sea of Japan by the Sound of Tarrakai and the Straits of La Perouse. It is about 1000 miles long by 500 broad. The coasts, which are quite barren, are for the most part steep and mountainous; and the sea, though free from ice during the greater portion of the year, is often visited by storms and dense fogs. It is chiefly frequented for the sake of the walrus fishing. On the northern shore lies the small town of O. (pop. 250) at the mouth of the river Okhota. The S. of O. was discovered in 1639 by Siberian Cossacks under Ivan Moskoitin.

Olaf the Saint, King of Norway, 1015-28, was descended by a side line from Harald Harfaager (q. v.), and was born in 995. He was early distinguished for pride and bravery, and in his twelfth year began a series of Viking expeditions in the Baltic and on the English and French coasts. After being converted to Christianity, and baptized at Rouen, he returned in 1015 to Norway, and soon afterwards wrested the sovereignty of that country from the powerful Jarls Erik and Svend. He now set himself to follow Olaf Trygvesson's (995-1000) example, propagating Christianity by fire and sword, and establishing his dominion over the whole of Norway. He married Astrid, daughter of the Swedish king Olof Skötkonung, who was forced by his people to yield his crown to his son Anund Jacob, in alliance with whom O. harassed Denmark during the pilgrimage of King Cnut. But after his return Cnut overpowered O., and even drove him from his own kingdom, where he re-established the régime of the Jarls. In 1033 O. reappeared in Norway, and was soon after defeated and slain at the battle of Stiklestad, near Thronhjelm Fjord. O. was canonised in 1164, is the patron saint of Norway, and till the Reformation his tomb in Thronhjelm Cathedral was that country's chief sanctuary and place of pilgrimage.

Olbers, Heinrich Wilhelm Matthias, a distinguished astronomer, was born at Arbergen, near Bremen, October 11, 1758. In 1777 he began the study of medicine at Göttingen; and on finishing his studies settled as a physician in Bremen. In 1811 he won the prize offered by Napoleon for the best *Memoir on the Croup*; but afterwards he devoted all his leisure to the study of astronomy. Comets were the great subjects of his re-

search, and he discovered no less than five. His great renown, however, rests upon the discovery of the Asteroids (q. v.), three of which—Pallas, Vesta, and Ceres—he first noticed himself. His observations and calculations of comets and planets are published in Bode's *Annuaire*, Encke's *Annuaire*, Zach's *Monatlische Korrespondenz*, and Schumacher's *Astronomische Nachrichten*. O. died at Bremen, March 2, 1840.

Oldbury, a town of England, in Worcestershire, 3 miles E. of Dudley by rail, on the Tame, a tributary of the Trent, and on the Birmingham Canal. It has a parish church (restored 1867), and numerous dissenting chapels, a people's hall, temperance hall, &c. There are large chemical works, iron foundries, steel works, malt kilns, and barge-building yards, and in the neighbourhood are iron mines, coal pits, and brickfields. Pop. (1871) 16,049.

Oldcastle, Sir John, 'the good Lord Cobham,' was born in Edward III.'s time. He became peer by marrying the daughter of the Lord Cobham who so sturdily opposed Richard II. In Henry IV.'s time he won a high reputation by his military prowess in France. Under Henry V. he was accused of heresy; and the king long reasoned with him privately, but in vain. Scholar as well as soldier, and a man of the firmest religious principles, Sir John had early embraced the tenets of Wiclif, and a Wiclifite he remained in spite of the king's entreaties and threats. He defrayed the expense of transcribing and circulating Wiclif's writings, and was most active in sustaining the labours of itinerant preachers. Examined before the Archbishop of Canterbury, he was committed to the Tower as a heretic, and from thence he escaped to Wales. He was accused of heading the rising at St. Giles's Fields, and subsequently of raising an army of 20,000 Lollards. The king believed the report; a bill of attainder was passed against Sir John, 1000 marks being set upon his head; and on the 25th December 1417 the brave knight died at the stake in St. Giles's Fields—hung in chains as a traitor, and at the same time burnt as a heretic. He was one of the bravest, wittiest, most religious yet most tolerant men of his time. He wrote *Twelve Conclusions Addressed to the Parliament of England*. See Gilpin's *Life* (1765); and Gaskey's *Life and Times of Sir John O.* (1844).

Old Catholics (Ger. *Altkatholiken*), the name assumed by a sect which has sprung up in Germany since the promulgation of the dogma of the Infallibility, July 18, 1870. Micheli's denunciation of Pius IX. as a heretic and devastator of the Church was followed by the protest of Döllinger, Friedrich, and forty-four other Munich professors against the binding authority of the Decrees. In August the leaders of the movement met at Nürnberg, and thence issued a manifesto declaring that they would not profess with their mouths that which, being men learned in ecclesiastical history, they could not believe in their hearts. Recalled by their bishops to obedience, some of the professors, as Haneberg and Dieringer, obeyed; others, of whom Döllinger, Reinkens, and Friedrich were the most prominent, refused, and were excommunicated, April 13, 1871. In the September of that year the first Old Catholic Conference was held at Munich, when it was affirmed that the object of the O. C. was not to create a new sect, but to reform the church from within, and that they accepted the Tridentine Decrees. Nevertheless, on August 11, 1873, Reinkens was consecrated 'Old Catholic Bishop of the German Empire' by the Jansenist Bishop of Deventer, and himself proceeded to consecrate a bishop of Basel. In October the Prussian government, in accordance with their policy throughout the whole ecclesiastical conflict, ratified Reinkens' consecration, and voted him a sum of £2400. The Bonn Conferences of 1874-75 discarded the authority of Trent, and 'came to an agreement' on the burning questions of the Immaculate Conception, the number of the sacraments, the merits of the saints, the nature of the Eucharist, &c., &c. At the same time it was agreed 'that the way in which the *Filioque* was inserted in the Nicene Creed was illegal, and that, with a view to future peace and unity, it is much to be desired that the whole Church should set itself seriously to consider whether the creed could possibly be restored to its primitive form.' The last concession was a sop to the Greek Church, self-chosen delegates from which, as well as from the Anglican communion, attended the conferences, hoping to further the reunion of the O. C. with the Oriental, Greek, and Russian Churches, and their 'gradual understanding with the Protestant and Episcopal Churches.' In Germany permission to

marry has hitherto been conceded only to the non-parochial clergy—in Switzerland it is open to all. The principle, however, of a married clergy is as fully admitted in one country as in the other. The advance of the O. C. in numbers has been far less rapid than in doctrine. In Germany, out of a Catholic population of 14,867,600, they claimed in 1876 but 17,203 adherents, divided into 118 communities, and served by 60 priests. The Mainz Congress (1877) attracted but 1500 hearers against the 5000 of the Congress of 1871; and secessions have already commenced, two Old Catholic priests having resigned their office in October 1877—Klein of Wiesbaden and Klemm of Hirschberg. For Switzerland there are no trustworthy returns, the numbers of priests being stated at 66, and of the members of their congregations at from 20,000 to 70,000. There, changes have been swifter, dissensions rife, than even in Germany, celibacy and confession having both been abolished by the National Synod of Olten (June 8, 1876), while the very founder of the Swiss branch, Pere Hyacinthe (q. v.), has quitted it in disgust. In truth, the Old Catholic schism has from the first been singularly lacking in vitality. Emphatically negative at the outset, it appealed to no fact or doctrine that could inspire growth into its members; a purely scholastic movement, it has served for a time the ends of careless Gallios, and, once discarded, must share the speedy extinction of the 'German Catholics,' or the lingering death of the Jansenists of Holland. See Döllinger's *Erklärung an den Erzbischof von München-Freising* (Mun. 1871); *Bericht über die Verhandlungen des Katholiken Congresses* (Mun. 1871); *Report on the Resolutions of the Bonn Conference of 1875* (Lond. 1876); and *The Offices of the Old Catholic Prayer-Book, done into English, and compared with the Offices of the Roman and Old German Rituals* (Oxf. 1876).

Oldenbarneveld. See BARNEVELD.

Oldenburg, a grand-duchy of Northern Germany, consists of three distinct territories—the duchy of O. and the principalities of Lübeck and Birkenfeld. Total area, 2471 sq. miles; pop. (1875) 319,314, of whom 71,743 are Catholics. O. PROPER (area, 2076 sq. miles; pop. 248,136) is bounded N. by the North Sea, and on the three remaining sides by Hanover. The chief rivers are the Weser in the E., and in the W. the Vechta, Leda, and other tributaries of the Ems. Uniformly level, the duchy consists of sandy moors (*geestland*), alternating with arable districts of no great fertility; while the coast is fringed by rich marshes protected from the sea by dykes. The moors cover 1600, the marshes 430 sq. miles, and three-eighths of the entire area are uncultivated. The absence of coal and scarcity of timber are partly compensated by immense stores of turf. LÜBECK (area, 201 sq. miles; pop. 34,085), 85 miles N.E. of O., consists of two portions, of which the northern and larger is entirely enclosed by Holstein, while the southern is bounded N. and W. by Holstein, S. by the free state of Lübeck, and E. by the Lübsche Bucht. With less marsh land than O., it has several large lakes, is watered by the Trave and Schwartau, and is well wooded. BIRKENFELD (area, 194 sq. miles; pop. 37,093), 184 miles S. of O., a hilly, vine-growing district, lies among the Hundsrück Mountains, between the French frontier and the left bank of the Rhine, is watered by the Nahe, and is the only part of the grand-duchy that is rich in minerals—iron, copper, lead, coal, &c. The population of West O. is of Frisian, of East O. and Lübeck of Low German, and of Birkenfeld of Frankish descent. The leading industries of the grand-duchy are agriculture, horse and cattle rearing, shipping, fishing, spinning, weaving, and the manufactures of sugar, tobacco, leather, &c. In 1876 it had 361 ships, of 57,364 tons; and in July 1877, 217 miles of railway. There entered its ports (1875) 2778 vessels, of 159,517 tons; and cleared 2801, of 166,283 tons. The government is a constitutional monarchy, the executive being vested in a responsible ministry of three departments, and the legislative in a *Landtag* of thirty-three deputies elected for three years. In the budget of 1877 the revenue was £296,985, the expenditure £328,112, and the public debt at the end of 1876 was £1,854,518. O. sends one member to the Bundesrath and three deputies to the Reichstag. Its military contingent is composed of an infantry and a dragoon regiment, with two batteries, all belonging to the 9th Army Corps. In the entire grand-duchy there are four gymnasia, one pro-gymnasium, nine *realschulen*, a school of navigation, and an agricultural college. O. (the capital) is the only town with more than 5000 inhabitants.

History.—From immemorial times the territory of O. was ruled by *grafs*, who claimed descent from the Saxon chieftain Wittekind, but first appear in history in the person of Egilmar (1108). His domains were divided among his descendants, vassals of Heinrich the Lion, Duke of Saxony, but were reunited under Dietrich the Fortunate, who in 1424 married Hedwig, a daughter of Gerhard VI., Duke of Slesvig-Holstein. The eldest son of this union, Christian, was elected King of Denmark (1448), of Norway (1450), and Duke of Slesvig-Holstein (1460), and became the ancestor of the Danish or Holstein-Glückstadt dynasty (extinct in 1863), and of the Dukes of Gottorp, one of whom in 1762 ascended the Russian throne as Peter III. (q. v.), his cousin Adolf Friedrich having nine years before been chosen King of Sweden. O. fell to Dietrich's second son Gerhard, whose grandson Anton I. (1526-73) introduced the Reformation, but remained true to Karl V. in the Schmalkaldic War, and from him first received his *grafschafts* as formal imperial fiefs. The younger line expired with Anton Günther, a wise and powerful ruler (1603-67), and for more than a century O. was governed by Danish viceroys. In 1773 Christian VII. ceded it to Paul Petrovitch, Duke of Holstein-Gottorp, and afterwards Paul I. of Russia, and he in turn renounced his claims in favour of a cousin, Friedrich August (1773-85), of the younger Gottorp line. A year later the Emperor Josef II. raised the *grafschafts* of O. and Delmenhorst to the duchy of Holstein-O. The second duke, Peter Friedrich Wilhelm (1785-1823), being insane, the governing power was intrusted to his cousin and successor, Peter Friedrich Ludwig. During his regency O. was forced by Napoleon to enter the Rhenish Confederation (1808), and in 1810 was annexed to the French Empire. Restored to the ducal family after the battle of Leipsic (1813), it was raised by the Congress of Vienna (1815) to a grand-duchy, and received an accession of territory in the principality of Birkenfeld. O. entered into a *steuerverein* ('impost-union') with Hanover and Brunswick (1836), during the revolutionary movement of '48 received a new and more liberal constitution (revised in 1852), which swept away many bureaucratic abuses, and greatly promoted trade and industries by joining the Zollverein (1854). Duke Nikolaus Friedrich Peter (1853-78) advanced his claims to the duchies of Slesvig-Holstein (q. v.) on their separation from Denmark, (1864), but having sided with Prussia against Austria in the war of 1866, relinquished those claims in favour of the former power (September 27, 1866), receiving a compensation of £150,000. See *Runde's Oldenburger Chronik* (3d ed. Old. 1863).

Oldenburg, the capital of the above duchy, is situated on the navigable Hunte, 24 miles W. of Bremen by rail. Its chief buildings are the Evangelical Lambertuskirche (1791), the Residenzschloss, with a library of 120,000 volumes; the Augusteum, containing the grand-ducal picture gallery; the Museum, Rathhaus, and theatre. In June 1876 a monument was erected to Herbart (q. v.), who was born here. There are manufactures of iron, tobacco, leather, gloves, &c.; and a lively river trade is carried on with Bremen and Bremerhaven. Pop. (1875) 15,701.

Oldham, an industrial town of Lancashire, on an eminence near the right bank of the Medlock, and 6 miles N.E. of Manchester by rail. Its textile industries existed prior to the reign of Charles I., but the rise of O., which has been unusually rapid, dates from the end of last century, and is due to the introduction first of Arkwright's large water-mills, and subsequently of steam-power, and to the situation of the town on the edge of the Lancashire coal-field, which gives employment to many of the inhabitants. O. has a parish church, rebuilt in 1830, a handsome town-hall, a school of science and art (1865), a Blue-coat school, founded by Thomas Henshaw, a public infirmary (1874), and a grammar-school, dating from 1617. During the period of distress consequent upon the failure of the cotton supply in 1863, various improvements were effected, the chief being the extension of the water-supply at a cost of some £200,000, and the laying out of the Alexandra Park, a recreation ground of 60 acres. Cotton is the staple product, and some of the finest cotton-mills in the kingdom, holding in the aggregate about 2,000,000 spindles, have been built in the town within the last three years (1875-78), the shares being largely held by working men upon the Limited Liability principle. Other manufactures are fustians, velveteens, corduroys, machinery, steam-engines and boilers, iron and brass wares, gas-meters, leather, and cordage. Pop. (1871) 82,629; of parliamentary

borough, 113,100. O. returns two members to Parliament, and publishes three newspapers.

Oldham, John, an English poet, born 9th August 1653, was the son of a nonconformist minister at Shipton, in Gloucester. He studied at St. Edmund Hall, Oxford, where he took his degree in 1674. While an usher in a school at Croydon, his gift of verse was accidentally discovered by the Earls of Rochester and Dorset and Sir Charles Sedley. After a short time spent in tutoring, O. proceeded to London, and found a patron in the Earl of Kingston, but was prematurely carried off by small-pox, 9th December 1683. O. had a fine and strong wit, and might have won fame had he lived. His chief work is a series of *Satyræ upon the Jesuits*, in which he imitates Horace and Persius with considerable success.

Oldhamia, the name of a peculiar fossil organism, represented by various species (of which the best known is *O. Antigua*), occurring in the Lower Cambrian rocks of Wicklow, Ireland. It consists of a central and jointed axis of small calibre, from various points of which, at regular intervals, fibres or branches radiate. According to Forbes the impressions of cells may be seen on these branches. O. has been regarded variously as one of an extinct group of *Sertularian* zoophytes allied to the existing 'sea firs,' as belonging to the *Polysoa*, and as a fossilised seaweed of Calcareous type. It is one of the oldest forms of life known, and is named after Dr. Oldham, late Director of the Geological Survey of India.

Old Red Sandstone, the name given to the formations, intermediate to the Silurian and Carboniferous, which stretch over the N.E. of Scotland, a large tract of Russia, and in a modified form over a portion of N. America. They seem to have been deposited contemporaneously with certain strata in Devon and the S.W. of England, described and grouped by Murchison and Sedgwick. These geologists regarded the O. R. S. of Scotland as identical with these English formations, and suggested the name Devonian as better applicable to the series. This name is now in general use, especially among the Continental geologists. It seems advisable, however, to retain both names, since the Scotch and English present distinct palæontological differences. Rocks of the true Devonian type are marine, and are met with in Ireland and the Rhineland near Koblenz and Köln. The rocks of the O. R. S. type have evidently been deposited in freshwater lagoons. The fossils are scarce; but when they do occur, it is usually in isolated groups, exactly as if they had collected in separate ponds or lagoons. Further, the species, mostly fishes, are not generally met with among the Devonian deposits, whose fossils are of deep-sea origin. In the S. of Scotland the O. R. S. is found skirting the hills in old valleys; it also occupies the larger part of the great central valley, and is widely developed in Forfar, Aberdeen, along the shores of the Moray Firth, in Caithness, Orkney, and Shetland. There are ordinarily recognised three subdivisions—Lower, Middle, and Upper—probably, however, as suggested by Professor Geikie, there are in reality only two. In certain localities the Lower seems to pass without break into the Silurian—near Edinburgh, however, there is an unconformability. The Lower consists of conglomerate and sandstone, singularly destitute of organic remains; but there are traces of crustaceæ, and the fish *Cephalaspis* is found. Volcanic rocks are frequent, especially in the lower strata. The Middle is represented by the Caithness flags, and passes down conformably to the Lower. Fossil fish and obscure vegetable remains abound. The characteristic genera are *Coccosteus*, *Asterolepis*, and *Dipterus*. The first occurs sometimes in Devon and the Rhine lands. The Upper Old Red resembles and passes conformably into the Carboniferous, and is unconformable with the Middle or Lower O. R. S. The characteristic fossil fish are the *Holopterychius*, *Pterichys*, *Dendrodus*, &c. The O. R. S. is further traceable through the Orkney and Shetland Islands to the S. of Scandinavia and eastward to Russia. In Russia they extend in unbroken strata just as they were deposited, and are identical in fossil contents with the Scottish rocks. In America—in New York, Pennsylvania, Canada, &c.—the rocks seem intermediate in character to the typical Old Red and the typical Devonian. The O. R. S. is for ever associated with the name of Hugh Miller, who did more than any other man to disclose its fossil contents. See Miller's *Old Red Sandstone* (1847).

Oldys, William, an English bibliographer and antiquary, was the natural son of Dr. Oldys of Lincoln, and was born July 14, 1696. In 1737 he succeeded Wanley as Lord Oxford's librarian, and was employed on the catalogue, and in the selection of *The Harleian Miscellany*. In spite of extreme habits of dissipation he was a laborious student, and in his *Life of Sir Walter Raleigh* and *The British Librarian* has collected much curious information. He likewise wrote *The Scarborough Miscellany*, *The Universal Spectator*, and 22 articles in the *Biographia Britannica*. But the most valuable of all his works is an annotated copy of Langbaine's *Account of the Early Dramatick Poets*, now in the British Museum. He is credited with the authorship of the delicious Anacreontic, beginning 'Busy, curious, thirsty fly.' Norfolk made him Norroy king-at-arms in 1755. He died of drink, 15th April 1761. See Yeowell's *Memoir of O.*, together with his *Diary*, &c. (1862), and Disraeli's *Curiosities of Literature*.

Olea'ceæ, a natural order of about 150 species of lofty or middle-sized trees or shrubs generally much branched. The leaves are opposite, simple, or winged; the flowers rarely unisexual, the corolla four-lobed or cleft, sometimes absent, and the stamens generally two; fruit, a drupe—as in the olive, or dry capsule—as in the lilac, or a winged samara—as in the ash. They are widely distributed over temperate regions, chiefly in the northern hemisphere. The properties are bitter, tonic, and astringent. Some yield a fixed oil; others furnish manna. See **ASH**, **OLIVE**, **LILAC**, **PRIVET**.

Olean'der (*Nerium*), a genus of *Apocynaceæ*, or the dogbane family, consisting of shrubs with a milky juice, entire leathery leaves, flowers large, in terminal cymes, with a crown of torn appendages opposite to the corolla lobes; fruit when ripe a cylindrical capsule. *N. Oleander*, a common handsome evergreen shrub of moist ravines in the Mediterranean region and Syria, has been cultivated in Britain for three hundred years for its ornamental appearance. The whole of the plant is poisonous, and it is recorded that persons have died from eating meat cooked on spits of the peeled stem. *N. odorum*, an Asian species, common along the sides of rocky stream beds in India, is grown in the gardens there with single and double flowers. Both bark and root are poisonous; the leaves are used in native medicine.

N. Oleander.

Oleas'ter. See **ELEAGNUS**.

Ole'iant Gas (C_2H_4) is a product of the action of heat upon coal or other substance rich in carbon, and is an important constituent in the illuminating gases obtained from such materials. It may be prepared by acting upon alcohol with strong sulphuric acid. It burns in oxygen with a bright clear light, is more soluble in cold than in hot water, and can be liquified under great pressure. If heated intensely it is decomposed partly into carbon and marsh gas (CH_4) and partly into acetylene and hydrogen. It acts upon an equal volume of chlorine, and forms a heavy oily liquid known as *Dutch Liquid*, which resembles chloroform in odour. It gives a similar reaction with bromine.

Ole'ic Acid ($C_{18}H_{34}O_2$) is the most important acid of the fatty group, and is obtained by saponification of *olein*, the fluid constituent of most fats and fixed oils. By cooling olive oil to 4° C. or lower, a large quantity of fat solidifies. This solid portion is mainly palmitin or margarin (see **MARGARIC ACID**), and the oily liquid left behind is chiefly olein ($C_{18}H_{34}O_2$). The olein is obtained pure by dissolving the liquid in alcohol, filtering, and then driving off the alcohol by heat. During the process of saponification, this oil is resolved into glycerine and O. A., which is readily distinguished from other fatty acids by its melting at 14° C. to a colourless limpid oil, which solidifies at 4° C. into a hard white crystalline mass. When solid it oxidises but slowly in the air; but when liquid, it absorbs oxygen rapidly, becoming yellow and rancid, and exhibiting a strong acid reaction. O. A. itself reacts neutral. It is insoluble in water, but very soluble both in alcohol and ether. A characteristic feature is its behaviour when subjected to destructive distillation—yield-

ing a solid crystallised dibasic acid known as *Sebacic Acid*. The other members of this dibasic series (suberic, pimelic, adipic, lipic, azelaic, &c., acids) result from the action of strong nitric acid upon O. A. O. A. forms neutral and acid salts, but the only important compounds of this class are the neutral oleates of potash and soda, which are soluble, and by evaporation of their aqueous solutions form *soaps*. The acid oleates are liquid and insoluble in water. The oleates of the alkalis occur in the animal body in the blood, chyle, bile, &c.

Oléron, Isle of (*Iluro*, *Uliarus*), an island of France, in the Bay of Biscay, S. of the Pertuis d'Antioche and N. of the dangerous Pertuis de Maumusson, at the mouth of the Charente, belongs to the department of Charente-Inférieure. It is separated from the mainland by a narrow and shallow channel, is $18\frac{1}{2}$ miles long, from $2\frac{1}{2}$ to $6\frac{1}{2}$ miles broad. Area, $59\frac{1}{2}$ sq. miles; pop. 18,200. The soil is remarkably fertile, and yields wheat, maize, wine, and fruits. There are large saltworks and fisheries, with some shipbuilding. The chief places are St. George d'Oleron (pop. 4110), Marais (3020), and St. Pierre d'Oleron (1575).

Ol'ga, Saint, a Russian saint, was wife of the grand-duke Igor of Kiev. After the death of her husband, she governed in his stead with great prudence for several years, and was finally baptized in 955 at Constantinople under the name of Helena, without, however, being able to induce her son Swatoslav to follow her example. Later tradition tells that she solicited German missionaries from the Emperor Otto I. She died in 969. St. O. is profoundly venerated in the Russian Church. Her festival is held on the 21st of July.

Olib'anum. See **FRANKINCENSE**.

Ol'fant's River, the name of two streams in Cape Colony—(1) O. R. West, rises in the Great Winterhock Mountains, and after a westerly course of 150 miles, falls into the Atlantic in $31^\circ 40'$ S. lat. Near its mouth this river overflows its banks, leaving fertile deposits of mud, on which account it has been grandiloquently termed 'the Nile of S. Africa.' (2) O. R. East, after a course of 150 miles from E. to W., through a very fertile district at the base of the Great Zwartberg range, joins the Gauritz River in $33^\circ 32'$ S. lat.

Ol'igarchy (Gr. *oligos*, 'few,' and *archê*, 'I rule'), a form of government in which the supreme power was restricted to a small exclusive class, usually composed of the wealthier members of a community, who legislated less for the common welfare than for their own personal aggrandisement. Aristotle regarded it as a corruption (*parekbasis*) of an aristocracy, to which it stood in the same relations as despotism does to monarchy. The Venetian constitution presents the latest and most powerful O.

Oligochœ'ta (Gr. 'few bristles'), an order of *Annelida* or Worms, of which the earthworm is the type. The name is applied to these worms from the absence of the characteristic bristles seen in the *Errantia* (q. v.) or marine worms. The body is segmented, the mouth anterior, and the anus posterior. In most of the segments paired 'segmental organs' exist. The O. are hermaphrodite, and the reproductive organs are situated in the front region of the body. To the order O. also belong the river-worms *Nais*, *Tubifex*, &c.

Olin'da. See **PERNAMBUCO**.

Ol'iphant, Lawrence, son of Sir Anthony O., C.B., sometime Chief-Justice of Ceylon, was born in England in 1829. He visited India in youth, and having accompanied Jung Bahadoor to the Nepalese court, published an account of his visit, entitled *A Journey to Katmandhu* (1852). Returning to England, he passed advocate in Scotland, and was also called to the English bar. After travelling through Russia, he wrote *The Russian Shores of the Black Sea* (1853). He was Secretary to the Earl of Elgin, Governor-General of Canada, and later Superintendent of Indian Affairs. O. travelled extensively in the United States, and published *Minnesota and the Far West* (1855). His *Coming Campaign* (1854) was followed by the *Trans-Caucasian Campaign under Omar Pasha* (1856), a personal narrative. He accompanied Lord Elgin on a special embassy to China in 1857, and in 1860 published a *Narrative of the Earl of Elgin's Mission to China and Japan*. He is the author of two novels, *Patriots and Filibusters* (1861) and *Piccadilly* (1870), the latter of which is a trenchant and witty satire on fashionable society. From 1865 to 1868 he represented the Stirling boroughs in Par-

lament; but in the latter year joined the semi-religious community established in Portland Township, New York, U.S., where he continues to reside. He was correspondent of the *Times* in Paris at the outbreak of the Franco-Prussian War, and a manager of the Direct Cable Company 1873-75.

Oliphaunt, Mrs., was born in Liverpool of Scotch parents about 1818. Her first work, *Passages in the Life of Mrs. Margaret Maitland of Sunnyside*, appeared in 1849; and wherever, as in this admirable book, the authoress has relied upon her thorough knowledge and humorous application of Scotch character she has been uniformly successful. Among her other novels are, *Merkland* (1851), *Adam Grange* (1852), *Harry Muir* (1853), *Katie Stewart* (1853), *Magdalen Hebburn* (1854), *The Quiet Heart* (1854), *Lilliesleaf* (1855), *Zaidee* (1854), the first series of the *Chronicles of Carlingford*, including *The Rector* and *The Doctor's Family* (1863); the second series, including *Salem Chapel* and *The Perpetual Curate* (1864), *Agnes* (1866), *The Minister's Wife* (1869), *John* (1870), *Three Brothers* (1870), *Squire Arden* (1871), *Omora* (1871), *At his Gates* (1872), *Innocent* (1873), *May* (1873)—perhaps the best novel of this authoress—its descriptions of Kifeshire scenery as fine as any of Black's northern sketches), *For Love and Life* (1874), *A Rose in June* (1874), *The Story of Valentine and his Brother* (1875), *The Curate in Charge* (1876), *Phoebe Junior* (1876—a *Last Chronicle of Carlingford*), *Mrs. Arthur* (1877), and *Carita* (1877). Mrs. O. has also written a very able *Life of Edward Irving* (1862), *Historical Sketches of the Reign of George II.* (1869), *St. Francis of Assisi* (1870), *A Memoir of Montalembert* (1872), and *Makers of Florence* (1877)—full of vivid description. She at present (1878) edits Blackwood's series of *Modern Classics for English Readers*, to which she contributed the first volume—a very interesting study of Dante (1877).

Oliver, Don Gasparo de Guzman, Count of, Duke of, San Lucar, was born at Rome, 6th January 1587, studied at the University of Salamanca, went to the Court of Spain, where by his adroit demeanour and convenient marriage he rose to the greatest favour. By the time Philip IV. ascended the throne O. had made himself essential to his existence by skilfully catering for his pleasures, and the position of Prime Minister he continued to retain for twenty-two years (1621-43) partly by a pursuit of the same policy and partly by bringing to disgrace all his rivals. But his enormous expenditure gradually sapped the resources of Spain—the war with France in 1636 was a failure, the Catalans and Portuguese revolted in 1643, and O. was dismissed to Toro, where he died, 22d July 1645.

Olive (*Olea*) a genus of about 30 species of trees or shrubs with opposite, leathery, evergreen, entire leaves; small, often fragrant flowers, frequently disposed in axillary racemes or terminal panicles; a drupaceous fruit consisting of an oily flesh and a hard kernel, which is rarely more than one-seeded, the cells of the fleshy albumen being filled with oil. The species are mostly Asian and African, though some reach Australia and New Zealand, but it is not certain whether the common C.—notwithstanding its name of *O. Europea*—is indigenous in Europe. That it is a native of Palestine is certain, and that it was well-known in Greece in the 6th c. B.C. is evident from Solon enacting laws regarding its cultivation. Greek colonists early carried it westward, and it is now thoroughly naturalised through the Mediterranean region. It was first planted in England in 1643. Quite recently it has been established in America, where it thrives well, particularly in Peru and California. From the earliest times the object of its cultivation has been the oil which is obtained by expression from the pulp of the fruit, forming a most important food-provision in many of the countries where the tree flourishes, and one of their principal exports. There are, besides the two recognised forms of the species, three principal varieties and perhaps fifty sub-varieties in cultivation. The quality of the O.-oil differs according to the country of growth, and care in preparation. That from Nice, Genoa, and Florence (Leghorn), is the best—the last in its wickered flasks being known as salad-oil. It is extensively used in various arts, manufactures, and in medicine. Spain alone yearly produces 250 million lbs. Some varieties of the unripe fruit preserved in brine are with many a favourite relish. The O. is a picturesque tree, and its associations give it special interest. It is remarkable for its fecundity and vitality, e.g., there are specimens on the Mount of O. at

Jerusalem reckoned on good authority to be 2000 years old. The wood is of a yellowish-brown, irregularly mottled, and veined with blackish-brown. The gum-resin exuded by the bark contains the crystalline oliv. From *O. cuspidata* a medicinal oil is extracted in Afghanistan; its very hard dark-brown and beautifully mottled wood is highly prized in India for turning. *O. fragrans*, well known in a wild or cultivated state in India, China, and Japan, bears fascicles of white flowers with an exquisite fragrance, used by the Chinese to flavour tea.

Olivénite, a copper ore occurring in prismatic crystals or in velvety coatings. Its colour varies from olive-green to brown. It consists chiefly of arsenate of copper with a little phosphate.

Olivénza, a town of Spain, province of Badajoz, 10 miles S.S.W. of that city, on a small tributary of the Guadiana. It is strongly fortified, has manufactures of oil, cloth, and pottery, and carries on a trade in corn and wine. Pop. 10,000.

Olive Oil, one of the most valuable of all oils as a source of food, and for use in many industrial processes. Its qualities and purity vary much according to the processes adopted for its extraction. Virgin O. O., flowing either spontaneously from the fleshy pericarp of the olive, or obtained by very gentle pressure, is the finest quality, but it is comparatively scarce. Fine or salad oil is obtained by crushing the entire fruit and pressing it at a gentle heat; by allowing the fruit to ferment previous to pressing it, a lower quality of oil, much used for food, is obtained. By fermenting and boiling the oil-cake resulting from these processes, a proportion of oil of inferior quality is obtained, and what is termed *huile d'enfer*, or oil of the infernal regions, is skimmed from the waste water of such boiling, which is run into reservoirs and allowed to settle. The oils of the various localities have different values; thus Provençe oil is the finest for the table, next to it come the Florence and Lucca oils. Gallipoli oil is the most important for all industrial applications, and Spanish oil is generally of inferior quality. Besides being used extensively as a substitute for butter on the Continent, O. O. is largely consumed in the preparation of tinned sardines. Gallipoli oil is indispensable in Turkey-red dyeing, and is also much used in making a special kind of soft soap. The imports into Great Britain during 1876 were 24,022 tuns, valued at £1,089,176.

Medicinal Properties of O. O.—Olive oil is used in medicine for its nutritious and laxative properties, and as a demulcent and a laxative enema. It is employed extensively in pharmacy, in the preparation of liniments, ointments, and plasters. For internal use, it is given in doses of from $\frac{1}{2}$ to 1 oz.

Olives, Mount of (mod. *Jebel et-tur*, 'the mount,' and *Jebel es-Zeitun*, 'the mount of olives'), a low hill on the E. side of Jerusalem, separated from the city by the valley of the Kedron. With Luke it has a distinct proper name, Elaion ('olive,' xix. 29, xxi. 37, xxii. 39, Acts i. 12, 'Olivet'). The name only occurs once in the Old Testament (Zech. xiv. 4), although the hill is several times alluded to (2 Sam. xv. 30, 1 Kings xi. 7, 2 Kings xxiii. 13, Neh. viii. 15, Ez. xi. 23). The M. of O. rises abruptly from the bed of the Kedron, in terraced slopes and white limestone crags, to a height of about 600 feet (2786 feet above the sea), while on the east side it slopes very gradually away to the wilderness of Judea. There are three summits. The central and highest, which is crowned with the Church of the Ascension, lies due east of the site of the Temple. About 500 yards to the north of the church, and a few feet lower, is the northern summit, called Viri Galilæi (cf. Acts i. 11; mod. *Karem es-Seiyad*, 'Sportsman's Vineyard'). Nearly the same distance to the south is the third summit, which is a little lower; and 1000 yards S. by W. is an eminence called the Mount of Offence. The M. of O. has many historical associations. Four events in the history of our Lord are specially connected with it: the triumphal entry into Jerusalem (Matt. xxi.); the prediction of the destruction of Jerusalem (Mark xiii.); the betrayal by Judas (Matt. xxvi.); and the Ascension, according to Luke (xxiv. 50). At its foot near the bridge over the Kedron is the Garden of Gethsemane.

Olive'tans, or Brethren of the Holy Mary of Mount Olivet, were a congregation of Reformed Benedictines founded on the olive hill of Siena by John Tolomei, and confirmed by Pope John XXII. in 1319. The Society has long since declined, and has now only a few houses.

Ol'vine, or **Olivin**, in Mineralogy, anhydrous silicate of magnesia, coloured pale or dark green by protoxide of iron. It is a common kind of Chrysolite (q. v.). It occurs in erupted rocks in volcanic districts.

Olla Podrida (lit. 'putrid pot'), the Spanish equivalent for the Fr. *pot-pourri*, and the Sc. hotch-potch, a kind of dish prepared from meat chopped up into small pieces and with a mixture of vegetables of all kinds boiled up to a broth or soup. The term has also come to signify any miscellaneous or incongruous collection.

Ollivier, Emile, a French minister not likely to be forgotten, was born at Marseille, 2d July 1825, studied law, and passed advocate at Paris in 1847. At the Revolution of 1848, the Republican Government sent him to the Bouches du Rhône as *Commissaire général*, and soon after he was made *préfet* of Haute-Marne. Returning to Paris in 1849 he resumed his position at the bar, and rapidly attained distinction as an eloquent pleader. In 1857 he was elected one of the deputies for Paris against a Government candidate, and in the Legislative body became the nucleus of a Liberal opposition which, though very small in point of numbers, was composed of men of brilliant talents, and gave the Emperor much trouble. He took a prominent part in the discussions (1858) on the *Loi sur la Sécurité Générale*, the Franco-Italian War (1859), the liberty of the press (1860), &c. He was more than once 'suspended' professionally for his bold and incisive speech. Yet soon after 1863 he began to show a leaning towards the Imperialist policy, which increased every session, until finally on the 2d of January 1870 he became Minister of Justice and Religion, and nominally, but only nominally (as appears from his recent defence), head of the Cabinet. In July 1870 he pronounced passionately for war with Prussia. The 'light heart' with which O. went into the fatal conflict was no doubt heavy enough before the 10th of August, when he and his colleagues were overthrown, and General Montauban, Comte de Palikao, was charged by the Emperor to form a new ministry. Since then O. has resided chiefly in Italy, but has written *Principes et Conduite* (1875), a defence of his policy.

Olmütz (Slav. *Holomuv*), a strongly fortified town of Austria in Moravia, on the March, about 132 miles by rail from Vienna, is the seat of an archbishop, and of a university (founded 1581, transferred to Brünn 1778, and restored 1827). Its library contains 50,000 volumes. O. has 13 churches, the chief of which are the Cathedral, a fine Gothic edifice erected by King Wenceslaus, who was murdered here in 1306, and afterwards canonised; the church of St. Mauritius, built 1412, with a famous organ, having 48 stops and 2332 pipes. Other noticeable buildings are the Town-house, with a fine clock of 1574 on a tower 262 feet high; the Tower of the Trinity, on the Oberring, 122 feet high; the Arsenal, and on the heights, half a mile from the town, the Monastery of the Premonstratensians, founded 1074. O. has manufactures of cloth, linen, and porcelain, and is an important centre of trade (chiefly in cattle) between Poland and Moldavia. Pop. 15,229, exclusive of a garrison of 6000 men. During the Thirty Years' War the town was taken by the Swedes, and, during the First Silesian War, by the Prussians in 1741, but was regained in 1742. In 1758 it was unsuccessfully besieged for seven weeks by Friedrich the Great. Here in 1848 Ferdinand abdicated the Austrian crown in favour of his nephew, Franz Joseph, and in 1850, a conference between the representatives of Russia, Prussia, and Austria met to regulate the affairs of Germany.

Olonetz, a Russian government, bounded N. and N.E. by Archangel, E. by Vologda, S. by Novgorod, W. by Finland and St. Petersburg. Area, 59,567 sq. miles. Pop. (1871) 302,490. The territory of O. is a continuation of the plateau of Finland, and comprises a similar variety of lake, forest, and barren steppe. The principal lakes are the Onega and the eastern half of Ladoga. Only three per cent. of the surface is cultivated, flax and hemp being principally grown. The people maintain themselves by woodcutting, hunting, and fishing. The capital is Petrosavodsk; the ancient capital O. (pop. 1341) dates from the 13th c.

Ol'oron or **Oléron-Sainte-Marie**, a town of France, department of Pyrénées-Basses, on the Gave d'O. (formed by the confluence of the Aspe and Ossan), 15 miles S.W. of Pau. It

contains the 10th c. churches of Ste. Marie and Ste. Croix, has tanneries, dyeworks, and manufactures of woollen and linen goods, and exports to Spain, hams, timber, wool, &c. Pop. (1872) 7175. The *Iluro* of the Romans, O. was sacked by the Arabs in the 8th, and by the Normans in the 9th c., and was the scene of the peace concluded between Alfonso III. of Aragon and Carlo II. of Naples, July 25, 1287.

Olot, a town of Spain, province of Gerona, Catalonia, on the Fluvia, about 12½ miles from the French frontier. Cotton-spinning and weaving, with manufactures of silks, woollens, hardware, and soap, are carried on. Pop. 10,000.

Olténitza, a village in Rumania, on the left bank of the Danube, 37 miles S.E. of Bucharest, was the scene of a Russian defeat by the Turks under Omar Pasha, 4th November 1853. During the war of 1877 it was occupied in force by the Russians, and almost incessantly bombarded by the Turkish artillery from Turtukai on the Bulgarian side of the river. Pop. 1500.

Olympia, a plain of Elis, in the Peloponnesus, 3 miles long by 1 broad, was bounded S. by the Alpheus, W. by the Cladeus, and on the N. by Mount Cronion. Within this plain, at the angle formed by the two rivers, lay the Altis or sacred plane-grove (430 yards long by 215 broad), where the Olympic Games (q. v.) were held, and where stood the temple of Zeus Olympius, erected by the Eleans (572 B.C.), and adorned by Phidias and his school (437-33 B.C.). Around the Olympieum sprang up a Metroum, Hieræum, prytaneum, gymnasium, &c.; and Pausanias speaks of 240, Pliny of 3000, statues. Overthrown by the earthquakes of 522 and 571 A.D., the monuments of O. served the barbarian invaders as quarries of building-stone. For more than a thousand years they lay overwhelmed in sand, awaiting their resurrection. A French expedition first determined the site of the Olympieum (1829); and in 1875 the German Reichstag, adopting a scheme proposed by Professor Curtius, voted £1850 towards the exploration of the Olympian plain. The result of excavations has hitherto been the unearthing of the temples of Zeus (211 feet by 86) and Here (171 feet by 58), and the discovery of many exquisite sculptures—the Nike of Pæonius of Mende, a Hermes bearing the infant Dionysus, ascribed to Praxiteles, &c. See *Die Ausgrabungen zu O. vom Winter und Frühjahr 1875-76, herausgegeben von E. Curtius, F. Adler, und G. Hirschfeld* (Berl. 1876).

Olympiads, in Greek chronology, the intervals of four years between the celebration of the Olympic games, were reckoned from the year in which Coræbus won the foot-race (776 B.C.), and closed with the 301st Olympiad (270 A.D.). The name of the champion foot-runner was often substituted for the number of the Olympiad, just as modern sporting-men speak of Blair Athol's or Bluegown's year. This era did not come into use till after Alexander's death, and was first employed in history by Timæus of Sicily (352-256 B.C.). Under the later system, dating from Hadrian's dedication of the Olympieum at Athens (131 A.D.), the 1st Olympiad would answer to Ol. 227, 3, of the Greek era.

Olympias, the daughter of Neoptolemus I., king of Epirus, married Philip II. (q. v.) of Macedonia (359 B.C.), and bore to him a son, Alexander the Great (356). Her divorce by Philip (337) she revenged by instigating Pausanias to murder him (336), and by the execution of her rival Cleopatra. After the death of Alexander (323), who had always treated her with childlike reverence, O. fled from the hated Antipater (q. v.) to Epirus, but on his death in 317 took the field against Eurydice, Philip's grand-daughter, whom she put to death, with 100 Macedonian nobles. Her triumph was brief. Cassander (q. v.) hastened from the Peloponnesus, besieged O. in Pydna, and executed her (316). Cruel, passionate, and unscrupulous, O. had yet something of the grandeur and lofty spirit that characterised her son.

Olympic Games, held in honour of Zeus on the plain of Olympia (q. v.), were founded, according to tradition, by the Idæan Herakles, and revived by Iphitos, king of Elis (884 B.C.). They took place every fifth year on the first full moon after the summer solstice, and extended over five days. The competitors—who up to the time of the Roman conquest must prove their pure Hellenic descent—had to undergo ten months of preparatory training, the last in the gymnasium at Elis. The victors (*Olympionikoi*) received simple chaplets of wild olive (*kolimoi*),

but were rewarded by their fellow-citizens with statues, processions, immunity from taxes, and at Athens with a prize of 500 drachmæ and public entertainment in the Prytaneion. The twenty-four contests, six of which were for boys, included foot and chariot races, wrestling, boxing, &c. So far as we can gather from ancient writers, the performances at the O. G. have been frequently surpassed by modern athletes, and the longest foot-race did not by the highest computation exceed 2½ miles. The judges (*Hellandikai*) were chosen, except on three occasions, from the Eleans. Subordinate to them were the *alystai* (a kind of stewards of the course), and various other minor officials. Sacrifices opened and closed the games, at which no women might be present, with the single exception of the priestess of Demeter. But men flocked to them from every part of the Hellenic world; and writers were in the habit of reciting, artists of exhibiting, their works to the assembled multitudes. Thus the masterpieces of Herodotus, Anaximenes, and Dion Chrysostom are said to have been first given to an Olympic audience. Poetry, too, was called upon to celebrate the victors, and fourteen of Pindar's hymns are devoted to their praises. See Krause, *Olympia, oder Darstellung der grossen Olympischen Spiele* (Vien. 1838), and the Histories of Thirlwall and Grote.

Olympiodorus, the last philosopher of the Alexandrian school of Neo-Platonists of any note, flourished in the reign of Justinian (527-565 A.D.). Nothing certain is known of his life, though Creuzer has inferred from a passage in his scholia to the *Alcibiades* that he taught before the final suppression of the Athenian school by the Emperor (529). His style is pure for the age in which he wrote, and his works have preserved many fragments of the lost writings of Iamblichus, Damascius, and other philosophers. We have by him a *Life of Plato* (Lond. 1771), a polemic against Strato (in MS. at Munich), and scholia on the *Phædo*, *Gorgias*, *Philebus*, and *Alcibiades Prior* of Plato.—**O.**, an Aristotelian philosopher of the latter half of the 6th c. A.D., wrote a commentary on the *Meteorologica* of Aristotle (Ven. 1551).

Olympus (mod. *Elymbo*), a mountain of Thessaly, separated from Ossa by the Vale of Tempe, and stretching northwards far into Pieria, has an elevation of 9749 and a snow-line of 9000 feet. The base of the mountain is clothed with oaks, chestnuts, beeches, &c., and the upper slopes with vast pine woods. Its broad summit was regarded by the poets from Homer downwards as the home of Zeus and the other divinities, who passed, they fancied, to heaven through the cloud that constantly caps the highest peak. Other mountains of the same name were the Mysian O. (mod. *Anadolı Daglı*), attaining in Keshish Daglı ('monk's mountain') an altitude of 3531 feet; the Cyprian O. (*Troodos*) of 6655 feet; and the O. of Lycia, Elis, and Laconia.

Om, or **Aum** = so be it. A mystic word of uncertain derivation that figures prominently in both the Hindu and Buddhist religions. In the Vedas or early Sanskrit Scriptures, it appears as an exclamation of solemn assent. Later on it formed the auspicious word with which the Brahmin had to begin and end every sacred duty, and finally it came to be regarded as an abbreviated symbol representing the names of the three gods of the Hindu Trinity. In one branch of Hindu philosophy, called the Yoga, the repetition of O. is supposed to be all-efficacious in giving knowledge of the supreme deity. Similarly among the Thibetan Buddhists *om mani padme hum*, or the 'formula of six syllables,' constitutes the repeated invocation which sums up their whole religious life. It is ground in countless numbers out of the well-known praying machines, and is emblazoned on silk flags whose every flutter is a prayer. Its meaning is variously interpreted to be, 'Oh! the jewel is in the lotus! oh! i.e. the self-creative force is in the Kosmos, or 'salvation is in the jewel-lotus. Amen.'

Omagh (Ir. Gael. *Ophmaighe*, 'the beautiful field'), the county town of Tyrone, in the N. of Ireland, 109 miles N.N.W. of Dublin, and 19½ S.S.E. of Strabane, is situated on the river Strule, at the junction of the Camowen and Drumragh. It is connected with Londonderry by railway, and is the head-quarters of the N.W. military district. There is some trade in leather and corn. Pop. (1871) 3724. The history of O. dates from the 15th c., when we hear of it as a stronghold of the O'Neills. It soon fell into the hands of the English, and was burned by James II. in 1689. It was again burned by accident in 1743, which, perhaps, accounts for the regularity of its streets.

Omaha, a city of Nebraska, U.S., on the W. bank of the Missouri, 4 miles W. of Council Bluffs, is a centre of the Union Pacific Railroad, and has numerous churches and schools, a deaf and dumb institution (1869), a public library, and 3 daily and 7 weekly newspapers. There are oilworks, silver-smelting furnaces, pork-packing establishments, foundries, furniture factories, &c. Pop. (1870) 16,083. O. was laid out in 1854, and is now one of the leading railway depots in the N.W.

O'man. See MUSCAT.

O'mar I., **Abu Hafsa** **Ibu al Kettab**, second Calif of the Faithful, was born about A.D. 581, of the tribe of Benou Ada. At first a persecutor of the followers of Mohammed, of whom he was a relative, he underwent sudden conversion in 615, after, as the story goes, he had wounded his sister, whom he found reading the Koran. He became the great military captain in the wars of Mohammed, on whose death he acted as the *hajib* or vizier of the Abu Bekr, the first Calif, whom he succeeded in 634. He now carried out to the full the policy of aggressive religious war and annexation which he had suggested to Mohammed. The fall of Damascus and Jerusalem and the defeat of the Byzantine armies of Heraclius placed Palestine and Syria at his feet. Not long afterwards Persia, Egypt, Khorassan, and Armenia were added to the new empire. To these victories his generals Khaled ('the Sword of God') and Abu Obeidat largely contributed. The fiery valour and military skill of O. were, however, the great makers of Islam as a civil power; while his stern religious sense of justice kept his subjects in discipline. He did not, at first, exterminate the infidel. Thus, in the capitulation of Jerusalem the churches were spared, and the inhabitants were not enforced to teach their children the Koran; they were to wear turbans and shoes and adopt Arabian names, while they were deprived of arms. O. himself worshipped at Bethlehem and built a great mosque beside the Temple. The Persian King Zerdejer and his general Firuzi were finally defeated in 638. In 640 Amru destroyed the library at Alexandria and carried the banner of the Prophet westwards to Tripoli and Barca. In 644 O. was assassinated by a Persian slave, whose fancied wrong he had refused to redress. In private life O. was austere to asceticism, living on bread, dates, and water, sleeping often under a porch or a tree. One Persian historian describes him as riding a sorrel-coloured camel in an old tattered habit of hair-cloth, and carrying within his saddle-bags the food which he used. He ate out of the same dish as his followers, and prohibited the use of wine and silk dresses. He observed the Koran to the letter, was called Al Faruk, 'the divider' or 'the just one,' and is still almost adored by the orthodox sects of Islam. He organised the army on the Persian model of regular wages and pension. See Ockley's *History of the Saracens*, D'Herbelot's *Bibl. Orient.*, Gibbon's *Decline and Fall of the Roman Empire*, and Platen's *Geschichte der Tödtung des Khalifen Omar aus der Chronik des Djarhekre* (Berl. 1837).—**O. II.**, the 8th Omniad Calif, and the great-grandson of the first 'Commander of the Faithful,' succeeded Sulciman in A.D. 717. Deeply religious, and resembling his ancestor in sobriety of life and love of justice, O. prohibited the reading of the formal maledictions against the heretical Ali and his descendants, which the Omniades had introduced into the Mosque service, and restored to his traditional enemies their lands. For these acts of justice he was promptly poisoned by his friends in A.D. 720.

Omar Pasha ('Michael Lattas'), a distinguished Turkish general, was born at Plaski, a village in Austrian Croatia, 24th Nov. 1806. He entered the Austrian army, and was employed in the surveying of roads, but for some reason deserted, and, taking a situation as tutor in the house of Hussein Pasha, governor of Widin, became a Mahometan. He next obtained the appointment of writing-master in the military school at Constantinople, and, gaining the favour of Khosrew Pasha, the Seraskier, became in 1833 an adjutant on that officer's personal staff. He assisted in the suppression of the insurrection in Syria (1839), and Albania (1846), and received the title of Pasha (1848), with an important command in Wallachia. In 1852 he was charged with the expedition against Montenegro, and was on the point of occupying Cetinje when Austrian intervention induced the recall of his army. In June 1853 he was appointed commander-in-chief, and in that capacity inflicted several defeats on the Russians, at Oltenitza, 4th November 1853, Kalafat, 6th January 1854,

&c. He entered Bucharest in August 1854 on the withdrawal of the Russians from the Principalities. In February 1855, at Eupatoria, he harassed the Russian rear and brilliantly repulsed a strong attack on the 17th of that month. He was sent in October 1855 to relieve Kars with a force of 35,000 men, but failed to reach that city in time to prevent its surrender. Appointed Governor of Bagdad, he fell for one year (1859) into disgrace. He subdued the Montenegrins in 1862 and occupied Cetinje. His last achievement was the suppression of the Cretan insurrection in 1867. O. died at Constantinople April 18, 1871.

Ombay', an island of Australasia, N. of Timor, is 50 miles long and 30 broad, rises abruptly from the sea in high volcanic masses, and is inhabited by mixed Negro and Malay tribes. At Alor the Dutch have a settlement and carry on some trade in edible birds'-nests, pepper, wax, &c. Estimated pop. 194,000.

O'Meara, Barry Edward, was born in Ireland in 1786, joined the English army as assistant-surgeon in his eighteenth year, was disgraced in 1818, but entered the navy, where he served with credit. Napoleon was attracted to him in the voyage of the *Bellerophon* from Rochefort to Plymouth; and in his exile to St. Helena O. accompanied the emperor as private physician. His sole title to remembrance consists in his book, *A Voice from St. Helena, or Napoleon in Exile* (1822), which gave a record of conversations held with the fallen dictator, while it exposed at the same time the petty tyrannies of Sir Hudson Lowe. O. had already brought a charge against the governor of St. Helena of wishing to make away with Napoleon, and had very properly been dismissed the service, as the charge was both reckless and unfounded. He then lived in the neighbourhood of London, where he died, 3d June 1836.

Omelette (Fr. *aufs mûles*, 'mixed eggs'), a dish, the chief constituent of which is eggs. The eggs are whipped into a froth, flavoured, and lightly fried. The variety of omelettes is very great, and, although the dish appears to be simple, the successful cooking of an O. requires great skill and dexterity.

O'mens (akin to Sansk. *avman*, 'protection'), foreshadowings of coming events by casual occurrences, have been observed at all times and in all places. Reginald Scot, writing in 1584, says: 'Many will go to bed again, if they sneeze before their shoes be on their feet; hunters, if they chance to meet a friar or a priest, will couple up their hounds and go home; and he that receiveth a mischance will consider whether he met not a cat or a hare when he went first out of his doors in the morning, or stumbled not at the threshold at his going out, or put not on his shirt the wrong side outwards, or his left shoe on his right foot, which Augustus Cæsar reputed for the worst luck that might befall.' Even to-day there are educated people who at heart believe that the death-tick, the spilling of salt, a dog's howling, &c., are ominous of impending evil. Special families may have their own peculiar omen—in Ireland the wailing of the Banshee; in England the fall of a branch or the flight of a bird against a window. O., as a rule, are shrouded in time-honoured obscurity; only in rare instances can we trace them to their origin. The belief that he who first rises from a party of thirteen will die before the year is out is probably assignable to the Last Supper, where Judas first left the chamber. Friday, the day of the Passion, is unlucky, because on it the fairies vent their spite on mortals in whose redemption they have themselves no share. And it foreboded harm to meet a cat or hare, because these were the forms most frequently assumed by witches. *Prodigies* (Lat. 'exceptional cases,' from *pro*, 'forth,' and *ago*, 'I lead') differed from casual and natural O., in being supernatural and of strictly divine origin, as when dogs spoke at the expulsion of the Tarquins, or trees before the death of Cæsar. See Fallati's *Ueber Begriff und Wesen des Kômischen Omens* (Tüb. 1836); Brand's *Popular Antiquities* (new ed. Lond. 1876).

Omerkote (Umarkot), the chief town of the Thur and Parkar Political Superintendency, Scinde, British India, on the confines of the Great Indian desert, 95 miles E. of Hyderabad; pop. (1872) 3999. It has a considerable transit trade, and the neighbourhood is watered by a canal. O. is celebrated as the birthplace of the Mogul emperor, Akbar the Great, whose father, Humayun, had fled here after his defeat by Shere Shah. In 1847,

at the time of the acquisition of Scinde, it was ceded to the British by the Rajah of Jodhpore.

Ommiades, a dynasty of fourteen califs, who reigned at Damascus for nearly a century. Their founder, Moawiyah, the son of Mohammed's great adversary, Abu-Sofian, in early youth was dignified with the title of Secretary of the Prophet, and for forty years administered the government of Syria. He claimed the succession on the assassination of Othman (655), but not until Ali had shared his predecessor's fate (661) could he make his claims good. Moawiyah's reign was marked by the disastrous siege of Constantinople (668-675), by the advance of the Saracens in Africa, and by his important change of an elective to an hereditary califate. His son and successor Vezid (680-683) lost Persia to Husein, the son of Ali, and Arabia to the anti-calif Ibn-es-Sobeir. Abdulmelek (685-705) by his arms and policy reunited the Moslem empire, discontinued the tribute claimed by the Byzantine Emperors, and established a national mint. The next thirty-seven years were occupied by the reigns of his four sons, and of Omar, the best of the Ommiade race. Under the indolent Walid I. (705-716) the Arabic numerals were introduced into general use, Saracenic architecture attained a high perfection, and Spain and Transoxiana were conquered by Musa and other able lieutenants. Under the gluttonous Suleiman (716-717) and Omar (717-720) the second siege of Constantinople resulted in a second discomfiture; and under Hesham (723-742) the defeat of the Arabs at Tours by Karl Martel (732) turned the tide of Moslem conquest. Merwan II., the last of the Ommiade califs (744-750), had won in the Georgian wars the title of the Ass of Mesopotamia, an honourable epithet in the East. But in 747 the Abbasides (q. v.) raised the standard of revolt at Meru in Persia. Their first victory on the banks of the Zab was followed by a still greater one at Busir in Egypt (February 10, 750), in which Merwan fell, pierced by a lance. Eighty of his kinsfolk, invited to a banquet at Damascus, were treacherously massacred, two only escaping—one to S.E. Arabia, where he founded a califate that lasted for seven centuries; the other, Abd-ur-Rahman, to Andalusia in Spain. 'Except among the Syrians,' says Gibbon (*Decline and Fall*, ch. lii.); 'the califs of the house of Ommiyah had never been the objects of the public favour. The life of Mohammed recorded their perseverance in idolatry and rebellion; their conversion had been reluctant, their elevation irregular and factious, and their throne was cemented with the most holy and noble blood of Arabia.'

Ommiades of Spain.—Abd-ur-Rahman I. (756-787), Hesham's grandson, was gladly welcomed by the Arabs of Spain, and speedily established himself as Emir of Cordova (q. v.). He secured and extended his domains, which embraced nearly the whole peninsula, in the face of a formidable coalition headed by Karl the Great, whom he defeated at Roncesvalles (q. v.) in 778. He had also, like his two immediate successors, to struggle against the frequent revolts of his own subjects, Christian and renegade, which were first wholly suppressed by Abd-ur-Rahman II. (821-852), a wise and liberal prince, the splendour of whose court rivalled that of Bagdad, and attracted a host of scholars, poets, and artists. During the wars of his son, Mohammed I. (852-880) with Alfonso III. (q. v.), there grew up a spirit of chivalry that honoured women as nowhere else in Islam. But the greatest of all the Spanish O. were Abd-ur-Rahman III. (912-961), the vanquisher of Leon and Asturias, and his son Al-Hakem II. (961-976)—monarchs who 'employed the awful engine of despotism in promoting the happiness and intelligence of their species.' They fostered commerce and agriculture, founded eighty free schools, collected a library of 600,000 volumes, and under them the university of Cordova attained a European fame. Hesham II. (976-1013) was a child of eleven at his accession, and throughout his reign was overshadowed by the Grand Vizier Al Mansur, who, dying in 1002, transmitted his office to his son. By them the Arab army was recruited with Berber and Christian mercenaries, who, after co-operating in the conquest of Leon, Castile, and Barcelona, turned on their masters, and rent the Ommiade empire into a hundred petty principalities, the last of the emirs, Hesham III. (1027-31), dying despised and forgotten at Cordova in 1036. See Dozy's *Histoire des Musulmans d'Espagne* (4 vols. Leyd. 1861); and Weil's *Geschichte der islamitischen Völker* (Stutt. 1866).

Om'nibus (Lat. 'for all'), colloquially '*bus*,' a familiar large vehicle for conveying passengers short distances in cities. Om-

omnibuses commenced to run in the streets of Paris in 1827, but were indifferently profitable until Madame de Berry patronised them; thereafter they became the vehicles of the *bourgeoisie* and proved eminently successful. The prototype of the O. was the Parisian 'carriage of the five soldi,' the introduction of which in 1662 is ascribed to Blaise Pascal and several noblemen. In 1829 Mr. Shillibeer ran the first O. in London, which was drawn by three horses and carried twenty-two *inside* passengers. The seat on the roof for outside passengers was added in 1849. The London General Omnibus Company, founded in 1856, possessed in 1876 560 buses and 6000 horses. Each O. is adapted for carrying twenty-eight passengers in all; its weight averages 24 cwt., and the distance travelled daily 60 miles. About 70,000,000 passengers are annually carried by the London buses. In many cities tramway cars have to a large extent superseded the O.

Omsk, the capital of Western Siberia, government of Tobolsk, on the right bank of the Irtysh, near its junction with the Om, and more than 2200 miles E.S.E. of St. Petersburg. It is strongly fortified, and is the seat of the governor-general of Siberia, of the courts of justice, and the Siberian corps of cadets. Among the inhabitants are many who have been banished from Europe for political offences. A considerable trade is carried on with the Khirgiz in cattle, and there are also some manufactories and mining works. Pop. (1867) 26,722.

O'mul (*Salmo migratorius*), a species of *Salmonide* or Salmon (q. v.) found in Lake Baikal, and attaining a length of from 12 to 15 inches. Its flesh is palatable, and like the common salmon it ascends rivers to spawn.

Onagraceæ, a natural order of dicotyledonous herbs or shrubs, with simple, opposite, or alternate leaves, flowers regular, usually axillary, with parts as a rule in fours. The fruit is a round or oblong, many-seeded, fleshy berry, or a dry, four-valved capsule; the seeds are numerous, naked, or with a feathery appendage. The species are widely distributed, the annuals being generally found in temperate countries, and the shrubby members in Mexico, S. America, and New Zealand. A few yield minor edible products, and a good number have been brought into cultivation as ornamental plants. Chief among these are the *Fuchsia* (q. v.) genus. The N. American representatives are also favourites for out-door purposes, as *Enothera*, *Clarkia*, and *Godetia*. See CIRCÆA and TRAPA.

One'ga, next to Ladoga the largest lake in Europe, lies in the Russian government of Olonetz, and has an area of 4855 sq. miles. Its length is about 140 miles, breadth 59, and its depth varies from 590 to 738 feet. The banks are generally low, but in the S.W. they rise to about 300 feet, and it appears that the elevation of the lake must once have been much greater than it is now. In the N. end it divides itself into three bays, of which the most easterly is the widest. The lake abounds with fish, and its banks are cultivated with the exception of the swampy places. Fed by the Wodla, the Wytegra, and the Schuja, it connects itself by the Swir with Ladoga, and by the Kumsa with Segosero, and thus it forms a communication between the White and the Baltic Seas. The Swir and the Wytegra are connected by the Onega Canal. The chief island in the lake is Klimezkoï (44 sq. miles), and the chief town on its banks Petrosawodsk.

One'ga, a town of Russia, at the mouth of a river and on a gulf of the same name, with a pop. (1870) of 2329. In 1873 there entered 32 ships, carrying chiefly salt and fish to the value of £8200, and the exports of timber amounted to £36,000. The River O., 262 miles in length, flows from the Latscha Lake, receives on the right the waters of the Moscha, and joins the Gulf of O., a part of the White Sea.

Oneglia, a town of Italy, province of Porto Maurizio, on the sea-coast, midway between Genoa and Nice. It is beautifully situated, has a good harbour, constructed in 1825, and receiving yearly some 100,000 tons of shipping. O. is the birthplace of Andrea Doria (q. v.). Pop. (1874) 8047.

O'Neill. See TYRCONNEL.

On'eros Cause, in Scotch law, means *on account of valuable consideration*.

Onis'olo. See NICOLO.

On'ion (Lat. *unio*, Fr. *oignon*) is one of the prominent members of the genus *Allium* (q. v.). The O. itself is *A. Ceba*. Its native country is unknown, but its culture is as old as the history of the human race. The uses to which it is applied are very numerous; when young, in salads; when mature, in soups or stews, or alone, raw, boiled, or roasted; the smaller sized bulbs are also prized for preserving in vinegar as a pickle. Many varieties have been established by care and selection, and of these the Spanish or Portugal O., from its large size and mild flavour, is in much request. The underground or potato O. (var. *aggregatum*) multiplies by young bulbs on the parent root, they having all the properties of the common form. In the tree or bulb-bearing O. (var. *viviparum*) the stem produces bulbs instead of flowers, which, when planted, produce underground onions of extra-strong flavour. The so-called Welsh (Ger. *wälsch*, 'foreign') O., or ciboule (*A. fistulosum*), a native of Siberia, from whence it was introduced into Britain early in the 17th c. through Germany, never forms a bulb, but being very hardy, is sown in autumn for spring salads. The strong taste and smell of the O. are due to a volatile oil rich in sulphur, said to induce sleep. The O. stimulates expectoration.

Onion-Fly (*Anthomyia ceparum*), a species of fly belonging to the *Muscide*, and noted for the habits of its larvæ in attacking the onion. The larvæ cause the affected plants to turn yellow and to die. The young flies become pupæ in two weeks, undergo their transformation in the root, and a fortnight later appear as perfect flies.

Onis'cus. See WOODLOUSE.

Onk'elos, called the Proselyte, mentioned in certain Jewish writings (*Josifthah* and the *Babylonian Talmud*), is the supposed author of the Chaldee paraphrase of the Pentateuch called Targum O. He is said to have been the contemporary and pupil of Gamaliel; but as this may have been Gamaliel the Elder or Gamaliel II., he has been placed in the half c. before Christ, and about 40-120 A.D. By the best Hebrew scholars, however, he is now identified with Aquila (q. v.) or Akilas (at Babylon, Ankelos O.), owing to the great similarity between the incidents recorded of both. Unless O. be the same as Aquila, the two were contemporaries, both relatives of the reigning emperor, proselytes to Judaism, disciples of R. Eliezer and R. Joshua, and translators of the Bible under the auspices of these two rabbis. It is not supposed, however, that Aquila was the author of the Targum, but that it was made in the School of Babylonia to counteract the corruptions of the LXX., like the translation of Aquila, and was hence called a Targum in the manner of Aquila, an *Aquila Targum*. See Deutsch in Smith's *Dict. of the Bible* (1863), art. 'Versions.'

Onomacritus, a Greek poet who was banished from Athens. (circa 516 B.C.) for interpolating his own verses in the oracles of Muses, with the collecting of which he had been charged by Hipparchus. Fleeing to Persia, he incited Xerxes to undertake the invasion of Greece, by reciting to him those ancient prophecies that seemed to favour his design. Pausanias tells us that in his day certain poems were attributed to O., to whom the Orphic Hymns and the institution of the Dionysiac orgies have also been ascribed. See Eichhoff, *De Onomacrito Atheniensi* (1840).

Onomatopœ'ia (Gr. *onoma*, 'name,' and *poieō*, 'I make'), a principle of word-formation by which words are made to imitate or represent a sound characteristic of the objects they are intended to designate, as cuckoo, peewit, whizz, purr, &c. Such words are commonest in the language of children and of uncivilised races. Thus the Gallas from *djeda*, 'to say,' and *goda*, 'to make,' form *cakak-djeda*, 'to say *cakak*' = to crack, and *dadada-goda*, 'to make *dadada*' = to beat; whilst the child speaks of a dog as a *bow-wow* and a train as a *puff-puff*. Herder (q. v.), with many philosophers of the 18th c. and some few philologists of our own time, found in O. the origin of language. 'Man,' he supposes, 'sees a lamb, and looks for a distinguishing mark. The lamb bleats—the mark is found. "Ah, thou art the bleating animal," the soul says within herself, and the sound of bleating becomes the name of the lamb.' But, as a matter of fact, few animate, fewer inanimate, objects, and hardly any abstract ideas, have been named on the onomatopœic system. We may fancy, from force of association, that in *thunder* and

raven we hear an imitation of rumbling and croaking, till we find that *thunder* is from the same root (*tan*, 'to stretch') as *thin* and *tender*, and that the *ru* of *raven*, reappearing in *rune* and *rumour*, simply means 'to cry,' and would be equally applicable to the note of the nightingale or turtle-dove. See LANGUAGE; Steinthal's *Der Ursprung der Sprache* (Berl. 1858); the introduction to Wedgwood's *Dictionary of English Etymology* (Lond. 1859); and Max Müller's *Science of Languages* (Lond. 5th ed. 1866).

Ontario, the most populous though not the largest province in the Dominion of Canada, and formerly called Upper Canada or Canada West, is bounded N. by Rupert's Land, E. by the River Ottawa, which separates it from Quebec, and the St. Lawrence, which separates it from New York, S. and W. by the lakes Ontario, Erie, Huron, and Superior. Area 121,260 sq. miles; pop. (1871) 1,620,847. Surrounded on three sides by navigable water, it has a shoreline of several thousand miles in extent, everywhere broken by inlets, and affording excellent facilities for commerce, which have been further increased by the construction of numerous canals. The northern part of O. is hilly, containing rocks chiefly of the Huronian and Laurentian formations, and is valuable on account of its immense supplies of timber and great wealth in minerals, while it also includes some rich valley land. Among the mineral products are gypsum, lime-phosphates, marble, iron, copper, and silver ores. S. of this district lies the Great Plain of Canada West, consisting of beds of clay and gravel resting upon Silurian and Devonian limestones, sandstones, and shales. This is the most fertile portion of the province, that on which the greater part of the cereal crops are raised, and containing also forests of hard-wood trees. A large amount of petroleum is obtained annually from the lower Devonian limestones in the S. W. The timber trade still takes the first place among the industries of O., though agriculture has of late years been making very rapid progress. The most valuable wood supplied by O. is that known as the white or Weymouth pine, which grows in the valley of the Ottawa. The fisheries are now of considerable importance. The mineral resources of the country are not yet properly developed. The chief exports to Great Britain are wood and wheat; the chief imports, woollen and cotton goods. Separate statistics, however, on the trade and manufactures of O. are not to be obtained from the official returns, in which it and Quebec are taken as one province. In 1876 there were 825 ships with a total tonnage of 114,990 belonging to O. In 1871 there were 330,965 Episcopalians, 356,442 other Protestants, and 274,162 Roman Catholics.—Lake O. was visited by Champlain in 1615 and Lake Superior by traders in 1660. In 1671 Perrot took possession of the territory near Lake Huron, and eight years afterward Niagara was founded by La Salle, when the lakes were explored as far as Michigan. The fort at Toronto was founded in 1749. In 1760 O., which formed part of French Canada, came with the rest of that province into the hands of the British, and was the field of several engagements during the war of 1812-15. In 1840 the provinces of Upper and Lower Canada were united, to be separated again in 1867 as provinces, but formed along with New Brunswick and Nova Scotia into the new Dominion of Canada. The internal affairs of O. are under the management of a lieutenant-governor, appointed by the Governor-General of the Dominion, and a house of 82 elective members, who together appoint the 24 senators by whom the province is represented in the Dominion Parliament.

Ontario, Lake, the smallest and most easterly of the five great lakes of N. America which are connected with the River St. Lawrence, is bounded on the N. and N.W. by the province of the same name, and on the S. and E. by the State of New York. It is 190 miles long, with an area of 7300 sq. miles, and an average depth of 490 feet. Its surface level is 334 feet below that of Lake Erie, and 231 above tide-water. The Niagara river enters it at the S.W.; the St. Lawrence issues from its N.E. extremity. Among the other streams received by the lake are the Trent and Humber on the N., and the Black, Genesee, and Oswego on the S. It has connection by the Genesee river and Oswego Canal with the Erie Canal, and consequently with the Hudson river and New York city. The most important towns on the Canadian shore are Toronto, Hamilton, Coburg, and Kingston; on the U. S. shore, Oswego, Sackett Harbour, and Port Genesee. Lake O. is the centre of an extensive commerce,

its great depth rendering it navigable throughout its whole extent for vessels of the largest size, and preventing it from freezing except close to the shore.

Ontology is that branch of Metaphysics which deals with inferences of unknown being, drawn from observed phenomena. Its prime object becomes the Supreme Being, and thus it may be termed scientific or rational theology. Yet its restriction to recognition of one Being is not necessary; for it may acknowledge a plurality of fundamental principles, and, unless when pantheistic, admits as distinct (1) Man, (2) the Universe, (3) God. The science of metaphysics was in ancient times almost entirely ontological; and although in modern history it has become psychological mainly, the systems of Spinoza, Leibniz, Fichte, Schelling, Hegel, Herbart, widely as their principles differ, may be mentioned as distinctly ontological.

Onus Proban'di, a legal phrase denoting *Burden of Proving* (q. v.).

Onyx (Gr. *onyx*, 'a finger-nail,' the markings of which those of the mineral were supposed to resemble), a chalcedonic variety of quartz which, like agate, consists of bands or layers of different colours; but in the case of O. the layers are superimposed in even planes, while in agate they are arranged concentrically. The various bands in good O. are sharply defined, and consist of white and black, or white, brown, and black layers. When layers of sard occur, the stone is called Sardonyx (q. v.). O. and sardonyx are the stones from which cameos are principally cut.

Onyx Marble, a fine translucent stalagmitic limestone obtained in the province of Oran, Algeria, and at Técali, near the city of Mexico. It is used as a decorative material, and is also made into small ornamental objects. It is the same substance, in part at least, called by Pliny and other classical authorities *alabastrites*, *onyx*, and *onychites*. O. M. is also known by the name of Oriental alabaster.

Oodeypoor (*Udaipur*), the capital of the native state of the same name in Rajputana, India, 70 miles W. of Neemuch, and 395 N. of Bombay, lies in a basin about 2000 feet above the sea. It was founded in 1568 by Udai Singh, after the sack of Chittor, the former capital, by the Moguls, and contains the most celebrated examples of modern Hindu architecture, which have been elaborately described and illustrated by Fergusson. The palace of the Rana is of granite, overlooking an artificial lake, 5 miles in circumference. The dam which forms this lake is faced with marble and adorned throughout with sculptures and temples.—The state of O., more properly called Meywar, occupies the S.E. of Rajputana, and has an area of about 11,614 sq. miles. Its pop. (according to an old estimate) is 1,161,400; the gross revenue is £640,000, of which £240,000 is in the hands of feudatory barons, and £130,000 has been assigned to Brahmins; the tribute is £20,000. The country is hilly and possesses some mineral wealth. Sheep and goats are abundant, and the cattle are good. The crops are millets, barley, wheat, sugar-cane, and cotton. Some suffering and emigration were caused by the drought of 1877. The ruler, whose title is Rana, represents the solar family of Rajputs, and is universally regarded as the head of the entire caste. The dynasty dates from 144 A.D., being descended from the ancient Hindu kings of Oude. In history they are celebrated for the heroic and continued resistance they offered to the Mohammedans, and for their works of public utility. They ever refused to ally themselves in marriage with the imperial house of Delhi. They fought against each succeeding Mogul emperor; and at the capture of Chittor by Akbar, 30,000 Rajputs and 1700 of the royal family are said to have perished. One Rana, in 1661, built a marble embankment, at a cost of £960,000, to employ labour during a famine; his successor constructed the Deybur lake, the largest in India, 30 miles round. Mahratta and Pindaree invasions, combined with internal dissensions, impoverished the state at the beginning of this century. Being much reduced in area, the protection of the British was accepted in 1818. In 1821 the district of Mairwara (q. v.) was temporarily placed under British administration, an arrangement which still continues. The inordinate claims of the feudal barons, who are mostly descendants of former Ranas, still cause trouble; and it is only in tradition that O. is the first Hindu state in India. The present Rana, who is eighteen years of age, succeeded his uncle

in 1874. See Tod's *Annals of Rajasthan*, Fergusson's *History of Indian Architecture*, and Roussellet's *India and its Native Princes* (London. 2d ed. 1878).

Oojein' (Ujain), an ancient city of Hindustan, now in the territory of Scindiah, the Mahratta Rajah of Gwalior, on the right bank of the Seepra river, 1698 feet above the sea, 260 miles S.W. of Gwalior and 598 S.W. of Allahabad. O. is one of the seven sacred cities of the Hindus, and the first meridian of their geographers. It is mentioned by Ptolemy, but its chief grandeur dates from the reign of the mythical Vikramaditya, whose era (57 B.C.) is still universally used through Hindustan. In Mohammedan times it was the capital of an independent Rajah of Malwa. The city is surrounded by a stone wall 6 miles in circumference, and is still densely populated. Most of the houses are built of brick, with a framework of wood; and there are many temples. The chief buildings are the palace of Scindiah, and the observatory of the Rajput astronomer, Jey Sing; around are numerous groves and gardens. The deserted ruins of the ancient city lie a mile to the N. A considerable trade is carried on in cotton and silk fabrics, precious stones, and Malwa opium.

Oolite. See LIMESTONE.

Oolitic or Jurassic System is the middle member of the Mesozoic or Secondary Formations, lying intermediate in position to the Trias and Cretaceous. It is divided into four great divisions—the Lias, the Lower Oolite, the Middle Oolite, and the Upper Oolite. The name Oolite was given to the series by Dr. William Smith, when he tabulated the Secondary Formations of England, from the occurrence in it of many beds of O limestone. The name Jurassic is derived from the Jura Mountains, whose chalk beds seem to be strictly contemporaneous with the Oxford or Middle Oolite. The Lias consists essentially of clay with numerous bands of argillaceous limestone in its lower parts, and an arenaceous and calcareous deposit near the middle. It is divided into the Lower Lias, the Marlstone, and Upper Lias, each of which has an assemblage of characteristic fossils, embracing cephalopods, lamellibranchs, crustacea, insects, fish, reptiles, &c. (see LIAS). The Bath or Lower Oolite is subdivided into five sections—Inferior Oolite, Fuller's Earth, Great Oolite, Forest Marble, and Cornbrash. The first of these, composed of beds of shelly limestone, brown marl, and arenaceous limestone rich in fossils, is separated from the Upper Lias by a loose sandy deposit. The whole group consists of alternating layers of clays, sands, and limestones, and contains many characteristic fossils. The Stonesfield Slate and the Bath Oolite, a valuable building stone, belong to the Great Oolite, which is remarkable for the remains of terrestrial reptiles and mammals. The other sections are considered under their respective headings. The Oxford or Middle Oolite consists also of clays, marly sandstones and limestone, and comprises the Oxford Clay (q. v.) with its beautifully preserved Ammonites and Belemnites, and the Coral Rag (q. v.), so rich in corals. The Portland or Upper Oolite is divided into three groups—the Kimmeridge Clay (q. v.), the Portland Beds (q. v.), and the Purbeck Bed (q. v.). The last two occur only in the S. of England, and their fossil characters indicate the gradual elevation of the land above the sea, and its subsequent submersion by fresh water.

Oomrawutt'ee (Amraoti), the chief town of the district of the same name in Berar, one of the assigned districts of the Nizam of Hyderabad, India, 417 miles E. of Bombay by rail, and 1338 W. of Calcutta. Pop. (1867) 23,410. It contains an ancient Hindu temple; but the city was founded in the middle of last century by the Mahrattas, who built the present wall, 26 feet high and $2\frac{1}{2}$ miles in circumference. The civil station, containing the headquarters of the province, is 2 miles distant. O. is one of the centres of the Berar cotton trade. In 1870 it contained 6 full presses and 4 half presses; and 42,000 bales, each weighing $3\frac{1}{2}$ cwt., were despatched to Bombay. There is also a large trade in spices, piece-goods, salt, sugar, and country cloth.—The district of O., which is divided from the Central Provinces by the Wardha river, has an area of 2767 sq. miles. Pop. (1867) 407,276. Cotton occupies 300,000 acres, other crops are rice, millets, and wheat.

Oons'o (Unao), the chief town of a district of the same name, in the Province of Oude, British India, 10 miles N.E. of Cawnpore, and 33 S.W. of Lucknow. Pop. (1869) 7,277.

It is a station on the Oude and Rohilkund Railway.—The district of O., which is bordered S. W. by the Ganges, has an area of 1349 sq. miles. Pop. (1869) 724,949. The crops are rice, wheat, barley, millets, oil seeds and sugar-cane. In 1874 the exports were valued at £456,000, the imports at £1,312,000.

Oond'wa Null'ah (Udha nala), a village in the district of the Sonthal Pergunnahs, Bengal, British India, near the right bank of the Ganges, 6 miles S. of Rajmehal, and 188 N. of Calcutta. Here was fought a battle in September 1763, in which Major Adams completely defeated the forces of Cossim Ali, the Nawaub of Bengal, and opened the road into Behar. The remains of the Mahommedan camp, which was protected by a marsh and defended by 100 guns, are still visible.

Oo'ri or Ou'ri. See LIMPOPO.

Oosterhout ('east holt or wood'), a town in the province of North Brabant, Netherlands, 6 miles N.E. of Breda, contains several large breweries, tanneries, and brick-works, and carries on a thriving trade in corn and cattle. The inhabitants are almost all Roman Catholics. Pop. (1870) 8472.

Oot'acamund (Ulakamand), familiarly known as Ooty, the chief town of the Neigherry district, and the hill sanitarium of the Madras Presidency, British India, 7400 feet above the sea, 330 miles S.W. by rail from Madras, and 70 miles S. of Mysore. Pop. (1871) 9982. The first house was built here in 1820. It is now the permanent residence of many Europeans, as well as a summer resort. The railway station is at Mettapollium. A convalescent depot for 1300 soldiers is in course of erection (1877) at Wellington. In the neighbourhood is the Lawrence Asylum for the children of soldiers, which has 380 inmates and an income of £10,000. The Botanical Gardens were the first scene of the successful introduction of the cinchona plant into India. The beautiful mountain landscape has been yet further adorned by an artificial lake, 3 miles in circumference, formed by damming up a valley. Coffee and potatoes are largely grown, as well as cinchona, and a little tea. See *Primitive Tribes of the Nilagiris*, by J. W. Brecks (London, India Museum, 1873); also art. NEILGHERRY HILLS.

Oot'rum the Indian name for the fibre of *Damia extensa*.

O'pah (Lampris luna), a curious fish, belonging to the order Teleostei, and to the family *Scomberide*, or Mackerels. It is cast up occasionally on the British coasts. The O. inhabits the warmer seas, and may attain a length of 5 feet and a weight of 120 lbs. Its flesh is red-coloured and palatable. It has a single dorsal fin, and is gorgeously coloured, its sides and back being bright green, and the fins and eyes scarlet. Pale golden spots are scattered over its sides. The O. is also named the 'King-fish.'

O'pal, a modified form of quartz, from which it differs in being less hard, from 5.5 to 6.5, as against 7; of lower specific gravity, from 1.9 to 2.3, against 2.5 to 2.8; and also in being uncrystallisable. O. has a vitreous lustre, inclining to resinous, and sometimes pearly. Its colour varies from white to grey and yellow, but it is frequently dark-coloured owing to impurities. There are many varieties of O., the most important and valuable being the precious O. This much-prized jewel-stone exhibits a most remarkable and brilliant play of colours, the cause of which is not satisfactorily known, although it has been ascribed to internal cracks and fissures of a uniform shape. Precious O. of a size greater than a small nut is very rarely found; but in Vienna Museum there is an example, not, however, wholly free from matrix, of the size of a man's fist, weighing 17 ounces, and estimated to be worth £70,000. Precious O. is found in veins in porphyritic rocks near Kashan in Hungary, at Frankfort, at Gracias-a-Dios in Honduras, in Ceylon, and a few other places. The other principal varieties of O. are the Fire O., Common O., Hyalite, Wood O., Float-stone, and Tripolite, the last consisting of the silicious shells of infusorial animals, consisting essentially of O.-silica.

Open-Bill (Anastmus), a genus of Grallatorial or Wading Birds, belonging to the Heron family (*Ardeide*). Species occur in Africa and E. Indies. The bill is of a remarkable shape, its halves coming close together at the tip, but being separated by a wide interval in the middle.

Open Doors, Letters of. These are writs in Scotch law which are requisite when goods in lockfast places are to be *poinded* (see *POINDING*). They authorise the *messenger* (see *MESSANGER-AT-ARMS*) to break open the doors where the goods of the debtor are stowed.

Opera, a musical entertainment of a dramatic kind. Rousseau has defined an O. as a musical, poetical, and spectacular work, but in modern operas the excellence of the music is the all-essential feature. Upon it, and not upon the interest of the drama, the skill of the libretto, or the art of the scene-painter, success depends. Few leading operas have words at all worthy of the music; hardly one shows extraordinary literary ability; and even in Richard Wagner's latest works, ostensibly produced as dramas primarily and as musical dramas subordina- tely, we are charmed by the music in a far higher degree than we are fascinated by the play. Thus the fine theory of a union of the highest form of musical, poetical, and scenic art can hardly be said to have been yet realised. Operas have been divided into many different classes, the principal being the Grand O. or O. Seria, which is of a grave and stately character; the Comic O. or O. Buffa, and the Romantic O., which holds an intermediate place between the Seria and the Buffa. In grand and romantic operas the por- tion of the dialogue not expressed in solos, duets, trios, con- certed pieces, and choruses, takes the form of recitative. In the comic O. as well as in the German Singspiel, and in English Ballad O. it is spoken. An overture usually proceeds an O. and sometimes certain of the acts, which vary from two to five in number. For adequate representation a chorus of 60 or 80 voices, and a band of 50 or 60 performers, with occasionally a military band, is required.

The dramatic art of the Greeks had somewhat of an operatic character, their declamation being akin to our re- citative. Modern O. had its birth in Italy, where dramas with music were produced so long ago as the 13th c. Sir John Hawkins ranks *Il Satiro* and *La Disperazione del Fieno* by Emilio del Cavaliere, two pastoral dramas produced in 1590, as the first real operas; but the honour of originator has been generally ascribed to Jacopo Peri, the introducer of recita- tive, who brought out *Dafne* privately in 1597, and *Euridice* publicly in 1600 with great approval. The first opera-house was built in Venice in 1637. The crude state of the orchestra and of musical art in the 17th and earlier part of the 18th c. has doomed to extinction the multitude of operas produced during that period in such cities as Naples, Rome, Venice, and Bologna; and the works of Monteverde, Cavalla, Porpora, and Pergolesi, &c., which obtained tumultuous applause at the time, are now never heard. Cimarosa's *Matrimonio Segreto* is the oldest work which keeps the stage. The brightest name among Italian oper- atic composers before the time of Rossini is that of Cherubini, whose *Medea* and *Deux Journées* are evergreen. Rossini threw new life into the Italian school, his works, *Tancrède*, *Semiramide*, *Il Barbiere di Siviglia*, *Guillaume Tell*, &c., being full of voluptuous airs, rich harmonies, force, fire, and originality. Bellini's operas are weaker, but the delicious melodies of *Norma* and *Sonnambula* have never ceased to charm. The prolific Donizetti had a graceful and flowing style; his *L'Elisir d'Amore* and *Don Pas- quale* are admirable specimens of opera-buffa, while in the popular and more ambitious *Lucia di Lammermoor*, *Lucrezia Borgia*, and *La Favorita* there are many effective passages, though their composer wrote too much and too carelessly. The modern Italian school has again sunk to the level from which Rossini raised it; its recent productions are feeble and frivolous, and the orchestral accompaniments in particular weak and com- monplace. Verdi is the only living Italian composer of much originality, find in his later works, such as *Don Carlos* and *Aida*, he has inclined towards the modern German school. His *Rigo- letto*, *Trovatore*, and *Traviata* are immensely popular. He excels in passionate and declamatory writing.

If opera was born in Italy it was perfected in Germany. Glück's *Alceste*, *Orpheus* and *Euridice*, and *Iphigenia in Aulis* were a great step in advance in scientific treatment and dramatic expression. Mozart attained the highest pinnacle which has yet been reached in lyrical composition, and his art is so perfect that while it charms the uneducated it delights the educated ear. *Don Giovanni*, *Notti di Figaro*, and *Zauberflöte* are glorious products of constructive skill, profound knowledge, and splen-

did imagination. Beethoven's only opera, *Fidelio*, is worthy of its great composer, whose genius was, however, more symphonic than operatic. The operas of Weber are purely German in character, and the romantic *Der Freischütz*, *Oberon*, and *Eury- anthie* are characterised by mingled strength and sweetness. The laboured works of Meyerbeer (who was as often Italian and French as German in style), *Robert le Diable*, *Les Huguenots*, and *Le Prophète* are masterpieces of musical learning and drama- tic effect. He was content to accept the form of opera as it existed, and to depict passion and express sentiment through the media of arias, concerted pieces, and choruses. Richard Wagn- er has taken a wholly different ground. His theory (as ex- pressed in his essays *Oper und das Drama*) is that music should be the handmaid and not the mistress of poetry. He has accord- ingly in his later works cast aside the aria and substituted the *melos* or 'endless melody'—continuous and appropriate decla- mation. After a long and uphill fight against prejudice, he has become the hero of the day in Germany, and his ideas are cer- tain to have a great effect upon the future history of O. There is indeed just a danger that they may be carried too far, and that some of his less gifted successors may commit themselves to as great absurdities as any in the old school. It is still an open question whether Wagner's earlier and less wayward works—*Der fliegende Holländer*, *Lohengrin*, *Tannhäuser*, &c., will not be valued by posterity more than his *Tristan und Isolde* and the *Niebelungen Trilogy*: and it is certain that the 'Music of the future' will never wholly supersede that of *Don Giovanni* and *Fidelio*.

Cardinal Mazarin introduced the Italian O. into France about the year 1645, and not long afterwards the national French O. was established, since which Court patronage and encouragement have been lavishly extended to the art in Paris. In this city many of the great masters' works have seen birth, and if Lully, Glück, Cherubini, Rossini, and Meyerbeer were foreigners, it cannot be denied that they drew some of their inspiration from France, and that they helped to mould the French school of writing, which combines the sentiment and mysticism of Ger- many with the gaiety and exuberance of Italy. France has pro- duced many fine operatic composers from its own soil, especially during the present century. Auber's *Fra Diavolo* and *Masani- ddo*, Halévy's *La Juive*, Gounod's *Faust* and *Romeo and Juliet*, and Ambrose Thomas' *Mignon* and *Hamlet* are works of which any nation might be proud. Since the death of Auber, Gounod has been the most illustrious representative of music in France. The ballet has always been an important feature in French O.

Henry Purcell set many dramas (*The Indian Queen*, *King Arthur*, *Dido and Enceas*) to admirable music, but Handel was the father of Italian O., as of oratorio, in England. Not one of the 44 operas which this great composer wrote, many of which were produced in London (beginning with *Rinaldo* in 1711) is now performed, and the very names of most of them are for- gotten. Buononcini's *Almahide* (1720) is said to have been the first O. sang entirely in Italian in London. The contemporary works of Dr. Arne (*Rosamond* and *Artaxerxes*) were equal to almost anything of their time. The taste for O., which was an aristocratic luxury a century ago, has now extended to all classes in England: in no other country is so much operatic talent gathered together at one time as in London during the season, and although no state support is given to music, the English capital is the only one which keeps two immense Italian O. Houses open at once. Here, however, English self-congratula- tion must end. English O. has never met with much encourage- ment, and a national school can scarcely be said to exist. Nor is there much hope for its institution in the future. A recent attempt to start a National O. House in the metropolis, at which during a portion of the year at least native works should be given in native dress, has ended in a lamentable fiasco. The most successful operatic composers England can boast of are Sir Henry Bishop, M. W. Balfe, and W. Vincent Wallace. Balfe's *Bohemian Girl* and *Rose of Castille*, and Wallace's *Mari- tana* and *Lurline* are among the few English works that have obtained any world-wide reputation. See *Memoirs of the Musi- cal Drama* by George Hogarth (1851), and *History of the O.* by Sutherland Edwards (1862).

Opera-Bouffe, an exaggerated form of opera buffa, is a farcical comedy usually in three or more acts, enriched by nu- erous sprightly airs and rattling choruses, and frequently e- livened by dances. Eccentric situations, ridiculous characters,

blatant costumes, and burlesque subjects are features of such pieces, while the music is often of a mock-heroic style designed to caricature that of the regular opera. Offenbach may be said to have created this species of entertainment, which has become almost as popular in England and Germany as in France. His most successful imitators and rivals are Lecocq, Hervé, and Johann Strauss.

Opera-Glass (Fr. *lorgnette*, Ger. *theater-perspectiv*) is a small binocular telescope, which gives a clear, sharply defined, but not greatly magnified image. It is useful for looking at near objects, such as the performers at a theatre or opera—hence its name. The field-glass is similar in construction, but larger in dimensions, and is useful for viewing scenery and buildings. The principle of its construction is the same as that of the telescope invented by Galileo. There are two lenses, a convex object-lens and a concave eye-lens. The rays from the object after passing through the object-glass converge to a focus; but before they reach the focus they are intercepted by the eye-glass, which restores them to parallelism or renders them divergent. The image is thus erect, and the magnifying power increases with increase of focal distance of the object-glass, and with diminution of focal distance of the eye-piece. See TELESCOPE.

Operculum (Lat. 'a cover'), in *Botany* denotes the covering of the capsular theca of Mosses (q. v.), but the word, or its adj. *operculate*, is also used when speaking, for instance, of the lid of the pitcher of *Nepenthes*, or of seed-vessels of the *Henbane* and *Anagallis*, in which the upper part or O. is thrown off in order that the seeds may be discharged.—In *Zoology* the name is given to the gill-cover of fishes, and also to the horny or limy plate borne on the foot of *Gastropodious* Mollusca, which is used to close the aperture of the shell when the animal has withdrawn into its abode. By the movements of the O. the gill-cavity is enlarged and contracted, and water is admitted and expelled in the act of breathing.

Ophecephalus, or **Ohpiocephalus** ('snake-headed'), a peculiar genus of *Teleostean* fishes found in the fresh waters of India, and containing species which are able to leave their native waters for longer or shorter periods and to move about on the land. Of this genus the *O. gachua*, or *Cora-mota*, is a good example. It is essentially eel-like or snake-like in form, and is very tenacious of life. Its colour is brown, banded with darker colour, and its length is about 12 or 13 inches. The *O. barca* is another and larger species, of a violet hue spotted with black. Its average length is 3 feet. These fishes are allied to the mullets. Dr. Andrew Wilson, in his work entitled *Sketches of Animal Life and Habits* (Chambers, 1877), says (p. 131):—"It would appear, from some recent observations on these fishes, that they are enabled not only to live, like the climbing perch, out of water, but that they die if kept below the surface of the water even for a comparatively short time. Thus when an O. and a carp were placed together in a vessel of water, a net being placed about two inches from the surface, the carp swam, as might be expected, freely and continuously below the surface; whilst the O. made vigorous efforts to attain the surface, for the purpose of inhaling air directly from the atmosphere." When not allowed to reach the surface, the ophecephali die, suffocated, in periods varying from twenty minutes to two hours.

Opheleide (Gr. *ophis* and *kleis*, 'a keyed serpent'), a brass wind-instrument of modern invention, of great compass and power, the largest of the trumpet species. It is similar in shape to the serpent, which it has almost superseded in the orchestra, and is fitted with keys. There are two kinds of opheleides in use, each having a compass of 3 octaves and one note.

The above is the compass of the bass O. The range of the alto O., which is little used, is one octave higher. From the overpowering strength of the instrument it requires to be carefully dealt with by a composer.

Ophid'ia. See SERPENTS.

Ophioo'ma. See OPHIUROIDEA.

Ophiogloss'ee' is, according to all but the most recent authors, a tribe or division of *Filices*, separated from the bulk of ferns by wanting the elastic ring girding the spore cases, and from the *Marattia* group by having a straight instead of a circinate vernation. Those who raise O. to a distinct and separate order, base their proposition on differences of the prothallus mode of development from the sporangia, and the stem never branching. There are three genera, two of which are represented in Britain. See ADDER'S TONGUE and BOTRYCHIUM.

Ophiomor'pha, Owen's name for a division or order of the class *Amphibia* (*Batrachia*), including the *Caciliada* or 'blind worms' of tropical climates, which were long supposed to be reptiles like our common 'slow' or 'blind worms,' but which were clearly proved to be amphibia by the discovery that the young breathe by gills. The vertebræ are biconcave, and the skin contains small horny scales. The teeth are numerous. No limbs are developed. The adult breathes by lungs, one of which is smaller than its neighbour. Ribs are developed, but there is no breast-bone. The eyes are rudimentary or altogether absent. *Siphonops* is a familiar genus.

O'phir (Malay, *Gunong Pasaman*), a well-known volcanic mountain in Sumatra, and the highest summit in the island, is situated near the centre of the great range that skirts the W. coast, and almost under the equator. It splits into two peaks, the highest of which, Telaman, has an elevation of 9940 feet. The mountain, which is cultivated from base to peak, sends down many foaming streams, and opens in romantic far-reaching valleys.

O'phir was a seaport or region accessible by sea from Ezion-geber on the Red Sea, from which gold, almuq-wood, and precious stones were brought by Tyrian and Hebrew sailors (1 Kings ix. 26-28, x. 11, xxii. 48). The above is all the information regarding it to be gathered from the Bible (1 Kings x. 22 does not necessarily apply to it); and its exact geographical position has been a subject of great doubt and discussion, having been placed by various authorities in Arabia, India, and Africa. It is evident from Gen. x. 29 that the writer understood O. to be in Arabia. Josephus says it was the golden Chersonesus, i.e., the Malay Peninsula (*Ant.* viii. 6, 4). See Karl Ritter's *Erdkunde* (vol. xiv.).

Ophisau'rus, a genus of Lizards (q. v.), represented by the *O. ventralis*, or 'glass snake' of N. America. This creature is essentially snake-like in its form, no limbs being developed. It inhabits plantations in which the sweet potato grows, and derives its name of 'glass-snake' from the brittleness of its tail, this member becoming readily detached from the body owing to the peculiar conformation of the muscles. The O. attains a length varying from 2 to 3 feet. Its colour is black, green, and yellow above, and the belly is bright yellow; but it varies much. It is innocuous.

Ophisu'rus. See SNAKE-EEL.

O'phites (Gr. *ophitai*, 'serpent-worshippers'), a sect of the Gnostics, who are said to have regarded the Jehovah of the Old Testament as an enemy, and the serpent who tempted Eve with the promise of knowledge as a benefactor of mankind. No trustworthy information concerning their tenets exists. Though never numerous, they are believed to have lingered on till the 6th c.

Ophiu'ra. See OPHIUROIDEA.

Ophiuroi'dea, an order of *Echinodermata* (q. v.), including the 'brittle stars' (*Ophiocoma*), the 'sand-stars' (*Ophiura*), &c. In this group the body is discoid in shape and contains the viscera, whilst the arms are mere appendages, and are not (as in the *Astroidea* or true starfishes) definite parts of the body containing portions of the viscera. The body is covered with scales and spicules, each arm being invested by four rows of plates. The mouth is inferior and central, and has tentacles and a dental apparatus. The stomach gives off no offshoots, and the reproductive organs exist near the bases of the arms. The *ambulacral system* is rudimentary. *Ophiura texturata*, the common sand-star, is a familiar example of the order; as also

is the *O. alba*, or white sand-star. To this group also belong the genera *Euryale* and *Astrophyton*.

Ophthalmia (Gr. *ophthalmos*, 'the eye'), or **Inflammatory Diseases of the Eyeball and Conjunctiva**. The various textures of the eye are subject to inflammation, and the variety of the disease receives its designation from the tissue specially affected. The conjunctiva, as the external covering of the eye, is peculiarly exposed to irritation from atmospheric dust, noxious vapours, and to the lodgment of foreign bodies upon its surface. Inflammation of the membrane or *conjunctivitis*, may be simple and catarrhal, or purulent. In *simple catarrhal O.* the membrane is congested and somewhat tumid, and the mucous secretion readily dries into crust upon the eyelashes and the margins of the lids; but the congestion is limited to the conjunctiva, and neither extends to the cornea, nor to the sclerotic vessels which surround the corneal margin. For this form of *O.* a solution of nitrate of silver, or of sulphate or chloride of zinc, of about two grains to the ounce of distilled water will prove efficacious. *Purulent O.* is described under three forms, viz., infantile, gonorrhoeal, and epidemic. *Infantile purulent O.* commences at about the third day after birth, and is generally due to inoculation with the vaginal secretions of the mother. The inflammation rapidly gains in intensity, and in severe cases the swollen conjunctiva overlaps the corneal margin, producing the condition called *chemosis*. The treatment required is cleanliness. The lids being separated by the fingers, a stream of warm water from a sponge should be allowed to trickle between them until all the discharge is washed away, and after being wiped dry a few drops of nitrate of silver solution should be allowed to fall between them, and the margin of the lids should then be anointed with spermaceti ointment, or with almond oil. *Gonorrhoeal O.* is much less amenable to treatment, the cornea being more apt to slough. The disease, which is highly contagious, is treated by a solution of nitrate of silver, of about a scruple to the ounce, or by a solid stick of a compound made by fusing one part of nitrate of silver with three parts of nitrate of potash, but the application requires great care. Sloughing of the cornea may terminate in collapse of the eyeball, or complete staphyloma, with loss of vision. The term *contagious O.* is used, almost exclusively, to denote an epidemic form of conjunctivitis extremely prevalent in Egypt, and said to have been introduced into Europe by the French army in the beginning of this century. When the disease appears in large communities living under insanitary conditions, as in large schools, and especially schools for pauper children, it spreads with great rapidity and is highly dangerous. The treatment of *epidemic O.* consists in perfect cleanliness, and the employment of metallic astringents such as the sulphate of copper, or the sulphate or chloride of zinc, or the nitrate of silver. In very severe cases Von Graefe recommends the application of liquor chlori, which also destroys the infective quality of the secretions, but its application requires the greatest care. All mild forms of *O.* bear metallic astringents from the beginning, and may be cured by them; but the more acute forms must be treated first by the local use of atropine and hot fomentations. *Corneitis*, or inflammation of the cornea, may appear as a distinct disease, or as the result of conjunctivitis, and the forms of the disease are divided into the vascular, the interstitial, and the suppurative, each form being attended at the onset by hyperæmia of the conjunctiva. *Vascular O.* appears first by the development of two fine crescents of vessels, one at the superior and the other at the inferior margin of the cornea, which gradually push before them a belt of turbidity which may cover the whole of the pupil, and thus destroy vision. The object of treatment is to arrest the progress of the disease before it reaches the centre of the cornea, so that all irritants, such as those recommended in the former class of cases, must be avoided. The appropriate local application is a solution of atropine of two grains to the ounce, two or three times a day, and the movements of the eyelids over the affected surface should be restrained by means of a compress of carded cotton wool, retained by a bandage. In the early stages the closed lids may be bathed with cold or iced water. *Interstitial O.* occurs most frequently in young children, in connection with hereditary syphilis, and usually commences as a diffuse haziness near the centre of the cornea of one eye. The general treatment is that of a chronic syphilitic affection, and the local must be entirely of a soothing character. Atropine,

in watery solution, or dissolved in castor-oil, should be applied. *Suppurative O.* may commence in the anterior layers of the membrane, producing an ulcer, or in the central layers, producing abscess. When pus is formed, the object is to facilitate its discharge with the least possible injury to the cornea, and the abscess should be opened without delay. Ulceration of the cornea may be followed by cicatrization, or by a protrusion called *staphyloma*, caused by the pressure of the ocular muscles. The iris is liable to various affections, the most important of which is *iritis* (q. v.). The structure next to the iris is the crystalline, which is naturally of brilliant transparency, but which, from perversions of nutrition, may become more or less turbid or opaque, constituting the various forms of *Cataract* (q. v.). Among the diseases which involve the deeper parts of the eye, the most important is *Glaucoma* (q. v.). A great number of morbid conditions, in the deeper parts of the eye, can be detected by means of the Ophthalmoscope (q. v.).

Ophthalmoscope, *The*, is an optical instrument by means of which the deep-seated structures of the eye may be examined. Without such an instrument it is impossible to see the deeper chambers of the eye, as the rays of light can only return from an eye by the same track along which they enter it, and the head of an observer intercepts the entering rays, and throws what he wishes to see into darkness. The *O.* is a small mirror, with a central perforation, and it acts by reflecting the light of a lamp, which is placed at the side of and a little behind the head of the patient, into the eye under examination. The returning light comes back to the mirror, and some of it passes through the central perforation into the eye of the observer. There are two methods of using the *O.*—the direct and the indirect. In the *direct* method, the eye of the observer is brought close to that of the patient, the mirror only intervening, so that the deep structures within are seen in their natural positions, magnified by their own crystalline lens. If either the patient or the observer be near-sighted or the reverse, the defect must be corrected by a concave or a convex lens of proper strength. In the *indirect* method the observer places himself at some distance from the patient, and holds up near the eye of the latter, and in the track of the light, a strong convex lens, which produces between itself and the observer an inverted, aerial, illuminated image of the fundus of the eye looked at, the image and not the fundus itself being the object of vision. By placing another convex lens behind the mirror, the image may be magnified and rendered more distinct. The art of using the *O.* consists in keeping the eye of the observer in a line with that of the patient, in maintaining a steady illumination, and in finding the correct distance. The *O.* is essential in the diagnosis of diseases of the deep-seated parts of the eye.

Opie, John, an English painter, was born at St. Agnes, near Truro, Cornwall, in May 1761. The son of a carpenter, he decorated the walls of his father's workshop and the boards he planed with likenesses of his friends and comic sketches. Dr. Wolcott took him to London in 1781, and in less than a year the 'Cornish Wonder' had painted the portraits of most of the nobility. His popularity vanished almost as speedily as it had risen; but *O.* was not in the least daunted, and started on a career of 'high art,' then much in vogue. He also began a systematic study of English literature by way of amending defective education, and pushed himself into the society of his social superiors in order to gain address, all the while bestowing the closest attention on the technique of his profession. On the resignation of Fuseli he was appointed Professor of Painting at the Royal Academy. He only delivered four lectures, which were published by his wife, with a memoir, in 1809. *O.* died April 9, 1807. Among his best historical paintings are 'The Death of David Rizzio,' 'Prince Arthur and Hubert,' 'Belisarius,' and 'The Murder of James I. of Scotland.'—*Amelia O.*, wife of the preceding, was the daughter of Dr. Alderson of Norwich, and was born there in 1769. In 1798 she married, and in 1801 produced a novel entitled *Father and Daughter*, gushingly sentimental, but with few signs of artistic skill. In 1802 appeared a volume of poems, many of them characterised by true and tender poetic beauty, and by which she is now better remembered than by her novels, *Adeline Mowbray* (1804); *Simple Tales* (1806); *Temper* (1812); *Tales of Real Life* (1813); *Valentine's Eve* (1816); *Tales of the Heart* (1818); *Madeline* (1822); *Illustrations of Lying in all its Branches* (1825). In 1825 Mrs.

O. became a Quakeress, and nothing else proceeded from her pen except a volume entitled *Detraction Displayed, Lays for the Dead* (1834), and a few magazine papers. She died at Norwich, 2d December 1853. See her *Memoirs*, by Miss Brightwell (1854).

Opinion, Oath of. In some cases mercantile men, or men of science, are required to swear to their opinion, not as regards a fact, but as regards their belief in mercantile custom, or in regard to the result of scientific research incapable of demonstration. In this case, to prove perjury, it must be proved that the deponent did not believe his own testimony.

Opinion of Counsel, is the technical term for the written statement of the view of a barrister (Scotch law, advocate) regarding the law applicable to the facts of a case, as laid before him in writing by a solicitor. This statement of facts is in England called 'a case,' in Scotland 'a memorial.' In framing this, it is the duty of the solicitor not only fully and concisely to state the facts of his case, but to direct the attention of counsel to the legal possibilities in connection with these. Counsel incurs no legal liability in giving his opinion, however erroneous it may be.

O'pitz, Martin, a classical German poet, born at Bunzlau, in Silesia, December 23, 1597, passed from the Gymnasium of Breslau and Beuthen to the Universities of Frankfurt and Heidelberg, and on the outbreak of the Thirty Years' War spent several years in travel, visiting Leyden in 1620, acting as Professor of Philosophy at Weissenburg in Transylvania, in 1622, appearing in 1623 at Liegnitz and in 1625 at Vienna, where he was crowned with laurel by the Emperor Ferdinand II., it being the first time this honour had been awarded for German verses. Soon after this he became secretary to the Burggraf of Dohna, and was ennobled, though a Protestant, by Ferdinand II. as O. von Boberfeld. In 1630 at Paris he made the acquaintance of Hugo Grotius (q. v.), and subsequently settling in Danzig was appointed Historiographer to Ladislaus IV., King of Poland. Here he died of the plague, 20th August 1639. Regarded alike by his contemporaries and the succeeding generation as the 'Father of German poetry,' O. exerted a great influence on German literature, and did much to fix the form of the German language. His most important work, *Buch von der Deutschen Poeterey* (1624), passed through nine editions before 1668. O. was the first to insist on the importance of both metre and rhythm, and this, added to his careful purity of language, made his rules of prosody to be observed long after his own verses had ceased to be examples. He has little elevation of thought or wealth of imagination; but his verses are tasteful, and his love of nature sincere. Among his works are *Zlatna oder von Ruhe des Gemüths* (1622); *Vesuv*, the first German descriptive poem; *Trostgedicht in Widerwärtigkeiten des Kriegs* (1632); his best work, *Judith*, a drama; translations of the *Antigone* of Sophocles, and of the Psalms, and an edition of the *Annolied*, a German poem of the 12th c. Complete editions of O.'s works were published at Breslau in 1690 and Frankfurt in 1724, and a selection by Müller in his *Bibliothek Deutscher Dichter des 17 Jahrh.* (Leips. 1822 et seq.). Biographies of O. have been published by Strehlke (Leips. 1856); Weinhold (Kiel, 1862); and Palm (Breslau, 1862).

O'pium (Lat., from the Gr. *opion*, 'poppy-juice'), is the concrete milky juice obtained from the capsules of a variety of the common poppy, *Papaver somniferum*. The drug is frequently mentioned by classical writers, and is specially described by Pliny, who also details its medicinal use. It appears to have been first prepared in Asia Minor, whence a knowledge of the drug and its manufacture gradually spread eastward; but there is no record of it as an Indian product before the beginning of the 16th c. At that time, however, it was not only manufactured in various parts of India, but also imported from Egypt, and it moreover formed an important article of trade with Cochin and other Eastern communities. It is supposed to have been carried to China by Arab traders as early as the 9th c.; but the trade thither from all parts continued to be of insignificant dimensions till the latter half of the 18th c., when the practice of opium-smoking began to take root among the Chinese populace, and was ministered to first by the Portuguese, and next by the British East India Company. The efforts of the Chinese to circumscribe the pernicious habit led to the prohibition of the import of O. in 1820, whereupon a regular smug-

gling trade was established by the East India Company with the connivance of Chinese officials. The complications which arose out of this state of matters culminated in the O. war and the treaty of 1842, under which the introduction of O. into the five ports opened to British commerce under the treaty was legalised. From that time the quantity of Indian O. imported into China has steadily increased, and the profit on the Government monopoly in the trade is now the principal source of Indian revenue. In the 15th c. O. was regarded in Western Europe as a valuable drug, and presents of it were frequently made by the potentates of Egypt to the Doges of Venice, with whom they had intimate commercial relations. At the present day O. is prepared on a commercial scale in Asia Minor, Egypt, Persia, East Indies, and in China.

O. as it comes into the market varies in appearance, shape, and chemical composition, owing to modifications in the method of preparation and to variations in the composition of the juice. The cultivation of O. in Asia Minor, whence the chief part of the supply of Western Europe for pharmaceutical purposes is drawn, extends over a wide area. The sowing of seed extends from November to March, and the plants are in flower from May till July. A short time after the petals have fallen away, and when the capsule has swollen to a diameter of about an inch and a half, the plant is in a condition to yield its juice. A careful incision is made with a knife round the capsule, the operator requiring to guard against allowing his instrument to pierce through it, as in that case the juice would run into the interior and be lost. The incisions are made generally in the afternoon, and next morning the juice which has exuded is collected by scraping with a knife. The pasty mass is kneaded into cakes of varying size, wrapped in poppy leaves, and exposed for some time to dry. In this still soft and pasty condition it is packed in baskets and forwarded to Smyrna or other ports of shipment, where it is examined and assorted into different qualities. In Bengal, where the cultivation has become an industry of great importance, and is conducted under official superintendence as a state monopoly, great care is exercised in the manufacture. The capsules at the proper stage of advancement are scored vertically by a rough three-pointed small instrument called a *musthur*, and the scarification is repeated on different occasions, the juice being always collected in earthenware vessels the morning after the incision is made. In the bottom of these vessels there gathers a dark-coloured thick liquid called *pasewa*, which is drained off from the soft O. paste. The pasty lumps are laid aside to dry, and when ready are taken by the cultivator to the government factory, where they are made up into round cakes of uniform size and weight, covered externally with an envelope of poppy petals agglutinated with *lewa*—a composition consisting chiefly of *pasewa* and inferior O. The finished cakes are exposed several months on racks to dry, being during that time frequently turned and carefully examined to prevent moulding. They are then packed into cases of forty each, in which condition they are sent into the Chinese market. Each cake weighs about 4 lbs. 3½ oz., and contains about 3 lbs. 8 oz. of O. The price in the Chinese market varies, having in 1871-72 reached £139 per chest, upon which price the government profit was £90. Nearly the whole of the O. produced in India goes to China, or to settlements in which the Chinese inhabitants are numerous. The total amount exported from India in 1872 was 93,369 chests, valued at £13,365,228. This total was exceeded in 1875, when 94,746 chests were exported, but the value of which was only £11,956,972. In 1876 the exports were 88,350 chests, valued at £11,148,426, of which 46,768 chests went from Calcutta, and 41,582 chests from Bombay, the latter consisting of Malwa O. The O. entered at Chinese ports during 1875 amounted to 66,461 peculs (133½ lbs. = 1 pecul), a quantity only exceeded in 1874, when 67,468 peculs were imported. O. cultivation is prohibited in China, notwithstanding which it is becoming increasingly an object of attention in many parts, especially Szechuen, Newchang, Tientsin, Chefoo, and Hankow, and its shipment from one port to another has become a considerable item. The amount imported into Great Britain during 1876 was 400,303 lbs., of a value of £394,034, the greater part of which was derived from Turkey. The use of O. in some civilized countries is largely increasing. According to the *New York Times* (January 1878) over 6,125,000 grains are daily used as a narcotic drug in the United States.

Chemical and Medicinal Properties of O.—O. has a peculiar narcotic odour, and an astringent bitter taste. It is an exceedingly complex substance, containing, in addition to mucilaginous and gummy bodies, various acid constituents; and no less than sixteen distinct alkaloids, besides numerous derivatives of these, have been obtained from it. The natural alkaloids are hydrocotarnine, morphine, pseudomorphine, codeine, thebaine, protopine, laudanine, codamine, papaverine, rheadine, meconidine, cryptopine, laudanosine, narcotine, lanthopine, and narceine. Of these the only two isolated for commercial purposes are the morphine and codeine, but it is chiefly on account of its richness in morphine that the commercial value of O. is based. The proportion of that constituent is found to vary enormously in different varieties of O., being generally very high in Turkish and lowest in E. Indian kinds. As much as 21.46 per cent. of morphine has been found in Turkish O., and good qualities should yield from 12 to 15 per cent., Benares O. giving only from 2.2 to 3.2 per cent., and other Indian varieties ranging from 3 up to about 8 per cent. Codeine is found only in the minute proportions of from 0.2 to 0.4 per cent. Narcotine is an abundant constituent of some varieties of O., reaching to even 10 per cent., and E. Indian O. always contains more narcotine than morphine.

The valuable stimulant, sedative, and narcotic properties of O. are universally recognised, so that it is justly esteemed the most important of all medicinal substances. It is principally employed in the form of a tincture under the name of laudanum, but it enters into the preparation of numerous patent and other medicines. Both for internal use and subcutaneous injection the hydrochlorate of morphine, being a definite chemical compound, is preferable to preparations of O., the strength of which is subject to great variation. O. is a substance, like most other narcotics, liable to peculiarly disastrous abuse, and it has been well said that it has been the source by its judicious employment of more happiness, and by its abuse of more misery, than any other drug employed by mankind.

The two forms under which the vice of habitual use of O. is practised consist in *O.-eating* and *O.-smoking*, to the first of which may be added morphia eating. The effects of habitual O.-eating have been brilliantly described by Thomas De Quincey, and its influence on the Turkish and Persian populations, where it is a prevailing vice, have been minutely described. A withered body, yellow countenance, crooked spine, radical disturbance of the digestive organs, and gradual destruction of all bodily and mental powers, constitute the penalty of habitual indulgence in a vice which, once acquired, holds its victim with peculiar tenacity. O.-smoking is the form which the indulgence takes among the Chinese, and while it is equally alluring it is only in a less degree disastrous. The form in which O. is smoked consists of an aqueous extract called by the Chinese *chandoo*. A pellet of this extract, about the size of a pen, is placed in the bowl of the small O. pipe and consumed at a single whiff. While the habitual use of O. in either way is so detrimental, it at first produces a pleasurable feeling of exhilaration, increased muscular power, and superiority to either mental or bodily fatigue, but it is followed by a corresponding feeling of depression when the influence of the drug has passed away.

In the case of poisoning with O., it is of the first importance to have recourse to the use of the stomach-pump, or other means of emptying the stomach, such as tickling the throat with the fingers or with a feather dipped in oil, or by means of the usual emetics. A marked antagonism between O. and theine, and less distinctly the Calabar bean has been established, and infusion of galls is recommended as a chemical antidote. The sufferer should be kept in active motion, and muscular and nervous vitality sustained by such stimuli as cold water, irritant applications like mustard, the use of strong coffee, ammonia, camphor, &c. Vegetable acids, as vinegar, lime juice, and tartaric acid are administered with great advantage only after the stomach has been emptied, and in the last extremity artificial respiration has been resorted to with success.

Opobalsamum. See BALSAM and GUM.

Opodeldoc, or Soap Liniment, is prepared by digesting at a temperature not exceeding 70° F. for seven days, 2½ oz. of hard soap, 1½ oz. camphor, 3 drms. oil of rosemary, 18 oz. rectified spirit, and 2 oz. distilled water. O. is contained in *Linimentum opii*, and is much used as an embrocation. *Arnica*

O. is prepared by dissolving by heat, and straining 4 parts of white soap, 10 of rectified spirit, 5 of tincture of arnica, and 1 of camphor. *Steer's O.* is similarly prepared, substituting spirit of rosemary for tincture of arnica.

Opoponax, a gum resin obtained by puncturing the roots of *Pastinaca opoponax*, a species of parsnip which grows throughout Southern Europe. O. was much employed by Hippocrates, Theophrastus, Dioscorides, and the ancient physicians, as an antispasmodic, but it is now seldom used in medicine.

Opor'to ('the harbour'), next to Lisbon, the most important harbour and commercial city of Portugal, in the province of Entre Douro e Minho, 195 miles N.N.E. from Lisbon on the right bank of the Douro, about 2½ miles from its mouth. The harbour is defended by the fort São João da Foz, and has a bar of sandbanks, the position of which has been considerably altered of late years by certain works at the mouth of the river, completed in 1872. O. lies on two high hills steep towards the Douro, and is connected with Villanova on the opposite side of the river by a fine iron bridge. The town extends for 2½ miles along the river, and presents with its lofty towers, monasteries, and gardens an imposing spectacle. Remains of its old Moorish walls still exist. It is very irregularly built, with steep and narrow streets, which are, however, well built, and have many houses ornamented with balconies of very various styles of architecture. Of its fifty-two principal streets and eleven squares the chief are Rua Nova dos Ingleses, the broadest and most frequented street; Rua Nova de San João, the most regular; and Rua das Flores, the seat of jewellers and goldsmiths; the Praça de San Ovidio, on the heights, with fine buildings, and terraces planted with flowers, having a grand outlook to the sea, is the largest square. Others are the Praça Corduaria, in the neighbourhood of the famous Passeo das Virtudes, a terrace planted with lindens; Praça de San Lázaro, with fine gardens and fountains, extending from a narrow street of the Passeo das Fountainhas along the river and overhanging it with steep rocks; Largo da Torre da Marva, underneath the hills, on the site of the ancient Cale, which (Porto Cale) gave its name to Portugal. On the high cliffs of the S. bank stands Da Serra, which was one of the richest of the monasteries, while the finest is the former Benedictine monastery of San Bento, now converted into barracks, and the oldest that of San Francisco, now the exchange. O. formerly had eighty monasteries and chapels. The cathedral stands near the bishop's palace, which, in the middle of the town and on its highest part, is one of the most imposing buildings. Near it is the old Gothic Cedofeita, the oldest church, founded 559 by the Visigothic King Theodomir. The Torre dos Clerigos ('tower of the clergy'), the highest tower in Portugal, was founded in 1748. Among the four hospitals, the largest is the excellently regulated De la Misericordia. The English factory, with a library, reading-room, and ballroom, is one of the largest buildings. O. possesses several good secondary schools, an opera-house and theatre, club-houses, an arsenal, and a house of correction. Several newspapers appear daily. The industries, employing upwards of 6000 people, are the most important in Portugal, and include linen, silk, wool, and cotton weaving, silk and cotton hosiery, gold brocade, lace, and button making, cutlery, earthenware, furniture, glue, glass, paper, hat and sail manufactures. In 1872 there entered O. 236 British vessels of 167,593 tons, and cleared 237 of 67,345 tons. In 1874 O. exported 6,628,820 imp. gallons of wine, chiefly red wine, known in England as Port Wine (q. v.), of which 1.4ths came to England. In 1877 the quantity exported to the United Kingdom was 7,721,028 gallons, being the largest quantity exported since 1801.—O. was occasionally the residence of the ancient kings of Portugal, was taken by the French in 1808, and retaken by Wellington in 1809. It was in 1831–33 the scene of the contest for the throne of Portugal between Don Pedro, the ex-emperor of Brazil, and Don Miguel. The *Almanach de Gotha* for 1878 gives the pop. of O. at 89,194.

Opossum, the name given to various species of Marsupials allied to the Kangaroos, &c., and which represent the only Marsupialia outside the Australian province, the O. being found in N. and S. America. It probably belonged originally to S. America, and has extended its distribution northwards. It forms the family *Didelphidae*, in which the great toe is nailless, and can be brought into opposition to the tips of the other digits,

so as to convert the foot into a kind of 'hand.' The 'pouch,' or *marsupium*, is imperfectly developed in many opossums, and

Opossum.

may be represented merely by folds of the abdomen, within which the nipples are concealed. Marsupial bones are, however, invariably present. The young of those opossums in which the pouch is unrepresented attach themselves (as in *Didelphys dorsigera*) to the mother by twining their tails round that of their parent. The O. has 10 upper and 8 lower incisors. Each jaw has, in addition, 2 canines, 6 premolars, and 8 molars, making a total of 50 teeth in all. The animal is carnivorous, and feeds on small quadrupeds, birds, and even crabs, but it is fond of fruits in addition. It is cunning, simulating death when caught, and the expression 'playing possum' has become proverbial in N. America, where O.-hunting is greatly relished as a sport. The skin is highly valued, and largely imported into Britain. The Common or Virginian O. (*D. Virginiana*) was the first marsupial known to science. It is found in N. America, attains a length of 3 feet inclusive of the tail, and is of a greyish-white hue, tinted with brown. The tail is prehensile and scaly. This animal is very destructive in poultry-yards. The crab-eating O. (*D. cancrivora*) measures 30 inches in length. Its colour is a dark brown marked with lighter hues, and its tail is singularly prehensile. This O. occurs in tropical America, and subsists on the crustaceans it obtains in the rivers and on the coasts. The Yapock (*Cheironectes Yapock*) has webbed hind feet, and attains a length of 2 feet. It is aquatic in its habits, and feeds largely on fish. The Yapock is a comparatively rare animal. Its colour is a pale grey variegated with four black bands running across the body.

Oppeln, a town in the province of Silesia, Prussia, on the right bank of the Oder, 50 miles S.E. of Breslau by rail. It contains a castle, five churches, a synagogue, and a theatre. Tobacco, wadding, and cement are extensively manufactured, and there is a large trade in the transit of timber, &c. Pop. (1875) 12,489, of whom four-fifths were Roman Catholic.

Oppenheim, a town in the province of Rhein-Hessen, Germany, on the left bank of the Rhine, 10 miles S.E. of Mainz, and a station on the Mainz-Worms Railway. It is surrounded by vine-clad hills, and contains the old *Katharinenkirche* (13th c.), a fine Gothic pile of red stone. The eastern half was restored in 1838-43. Near it is the ruined castle of Landskron, built in the 11th c., and destroyed by the French in 1689. The inhabitants are chiefly engaged in the cultivation of the grape. O., which stands upon the site of the Roman castellum *Bauconia*, was an important town during the Middle Ages, but suffered severely in the Thirty Years' War, and was laid waste in 1689 by the French. Pop. (1871) 3085.

Optical Illusions. The phenomena of O. I. may be referred to the insensibility of the eye to direct impressions of faint light, or to disorder in the nervous optic apparatus, or in that part of the brain with which it is connected. Sir David Brewster explains that when the eye is steadily directed to objects illuminated by a feeble gleam of light, it is thrown into a state nearly as painful as that produced by an excess of light. A remission takes place in the conveyance of the impressions; the object actually disappears, and the eye is agitated by the recurrence of impressions too feeble for the performance of its functions. 'These facts,' he says, 'may serve to explain some of those phenomena of the disappearance and reappearance of objects, and of the change of shape of inanimate objects which have been ascribed by the vulgar to supernatural causes, and by philosophers to the activity of the imagination. If, in a dark night for example, we unexpectedly gain a glimpse of any object, either in motion or at rest, we are naturally anxious to ascertain what it is, and our curiosity calls forth all our powers of vision. This anxiety, however, serves only to baffle us in our attempts. Excited by a feeble illumination of the object, the retina is not capable of affording a permanent vision of the object, and while we are straining our eyes to discover its nature, it will entirely disappear, and afterwards reappear and vanish alternately.' O. I. may occur in cases where the light is sufficient and the state

of the general health is unimpaired, and the origin of such impressions may be referred to the renewal of actual impressions formerly made on the sensorium. In certain diseased conditions of the brain, and in cerebral disturbance depending upon fevers, delirium tremens, or *mania à potu*, O. I. are common. In all such cases a morbid sensation is experienced, and the sensation is referred to an adequate exciting cause, the sensation being identical with that experienced when an external cause really exists.

Optic Nerve, Diseases of. The optic nerve may become swollen and prominent in some forms of intercranial disease, as in intercranial tumours, this condition being sometimes called *optic neuritis*. It may be entirely confined to the connective-tissue which unites the fibres, and may lead to atrophy of the nerve and Amaurosis (q. v.). Injury to the head may cause extravasation of blood in the sheath of the optic nerve, or absolute laceration of the nerve.

Optics is the science which treats of the phenomena of light and the laws which regulate these phenomena. The nature and properties of light, considered as a branch of physics, constitute what is known as *physical O.*, and are discussed under such headings as DIFFRACTION, INTERFERENCE, LIGHT, POLARISATION, REFLECTION, REFRACTION, UNDULATORY THEORY, &c. Here we shall limit ourselves to *geometrical O.*, which establishes theorems purely mathematical, but based upon the primary facts of the science. These are, that light travels in straight lines through a homogeneous medium; that when it suffers reflection at a given surface, the reflected and incident rays make equal angles with the normal at the point of incidence but on opposite sides of it; and that, when passing through a given surface from a rarer to a denser medium, the ray is refracted or bent inwards nearer the normal. In all such cases, the sine of the angle which the incident ray makes with the normal bears to the sine of the corresponding angle of the refracted ray a ratio which is constant for the same two media. When the first medium is the physical vacuum, this ratio is termed the refractive index of the other medium, air, water, glass, or whatever it may be.

If the reflecting surface is plane, incident rays, parallel, convergent, or divergent, will continue parallel, convergent, or divergent respectively after reflection; and similarly after successive reflections from a number of planes. If a plane mirror, from which an incident ray is reflected, be rotated round the axis in which it is perpendicular to the incident ray, the reflected ray will rotate also, but at twice the rate at which the mirror rotates. A ray is reflected from a curved surface exactly as it would be reflected from the tangent plane at the point of incidence. From consideration then of the tangent plane we can determine the direction of the reflected ray. In passing from any one point of the surface to another and contiguous one, the tangent plane suffers rotation through a definite angle round a definite instantaneous axis; and hence if two parallel rays are reflected at these contiguous points, the angle made by the reflected rays with one another is double the angle through which the tangent plane has been rotated in passing from the one point to the other. Hence these reflected rays, or the direction of these reflected rays, if produced, in general intersect. When the reflecting surface is concave, the contiguous reflected rays themselves intersect, and as we pass along any line on the surface, say the line of intersection by a given plane, the reflected rays by their ultimate intersections form a plane curve. By varying the plane of section an indefinite number of such curves results, and these all lie upon a surface known as the *caustic*, to which every reflected ray is a tangent. For the case of parallel rays reflected from the inner surface of a spherical segment, the caustic is similar in form to the surface of an apple round the point where the stalk is. The apex of the small conical depression lies upon that ray which passes through the centre of the sphere; and the reflections of all rays near to this one pass very close to the apex, which consequently appears to be much brighter than any other portion of the surface. This point is known as the principal focus, and is practically the point at which the reflected rays condense, since ordinarily a spherical reflector is but a small segment compared to the radius of the sphere of which it is a part. The focus in such a case bisects the distance between the reflector and the centre of the related sphere. If the incident rays diverge from a luminous point in the axis of the reflector, the focus is formed at a distance from the reflector greater than in the case of parallel rays. When the luminous point is at the

centre, the caustic shrinks, so to speak, into the same point—source and focus coincide. As the source is carried nearer and nearer, the focus is thrown further and further, until when it reaches the *principal focus* the reflected rays are parallel. If the luminous source is carried still nearer, the reflected rays become divergent and there is no caustic and therefore no focus. If convergent rays are thrown upon the spherical surface, the result is evidently the formation of a caustic nearer the reflector than the caustic for parallel rays. Every different form of reflector has a different form of caustic. The caustic for parallel rays falling upon a paraboloid of revolution is reduced to a single point, which is the geometrical focus of the surface. For an ellipsoid of revolution, rays diverging from its one geometrical focus meet after reflection in the other focus—the caustic being again reduced to a point.

Refracted rays give rise to caustics exactly as reflected rays do. Before touching upon these, however, it will be advisable to consider the refraction of a single ray. If there are two media, M and N, whose refractive indices, as defined above, are respectively m and n ; then, in passing from M the rarer into N the denser medium, the ray is bent in towards the normal at the point of incidence, and the sine of the angle of incidence bears to the sine of the angle of refraction the ratio $m : n$. In passing through a medium bounded by parallel surfaces, the ray suffers refraction twice; but the second refraction just undoes what the first refraction did, and the ray proceeds in a direction parallel but not generally coincident with its original direction. Should the bounding surfaces not be parallel, the ultimate direction of the twice refracted ray necessarily differs from the original direction. To study the phenomenon more closely, consider the

path of the ray OPQR through the prism whose transverse section is represented by the triangle ABC. The dotted lines represent the normals at the points P, Q, where the ray enters and leaves the prism. In passing through P, the ray is bent nearer the normal; and in passing through Q, it is bent further from the normal. Accordingly, in passing through a prism of greater density than the surrounding medium, a ray of light is refracted away from the line of intersection of the sides—represented by A in the figure. The refraction of a ray at a curved surface separating two media, is determined by the tangent plane at the point of incidence. Parallel rays falling upon the convex surface of a denser medium are refracted so as to form by their ultimate intersections a caustic. If the denser medium is bounded by two such surfaces, the rays are still more refracted from their original direction upon emergence. This is exactly the case of a double convex lens (see LENS), which, it is well known, converges rays originally parallel which have passed through it. The reason of this is at once apparent if tangent planes are drawn at the points of immersion and emergence, for the ray of light is refracted through the lens exactly as it would be through a triangular prism having these planes for sides. Considered in the same way, a concave lens must of necessity render originally parallel rays divergent. The bounding surfaces of lenses are ordinarily plane or spherical, one at least being always curved. For greater generality, we shall regard them as being doubly concave or convex—the radii of the two spherical surfaces being r and s . The principal focus of the convex lens is the point at which the rays, which pass through the lens near and parallel to its axis, converge. It is the brightest point of the caustic, and is indeed the same kind of geometrical point which forms the principal focus of a reflecting spherical surface. The concave lens has no real focus, but it has an apparent focus—the point namely from which the divergent refracted rays appear to diverge. The distance of the focus from the lens is given in both cases by the formula (where f is the focal distance and μ the refractive index)

$$f^{-1} = (\mu - 1)(r^{-1} + s^{-1}).$$

Rays which diverge from a point distant u from the lens are refracted so as to converge to or apparently diverge from a focus not coincident with the principal focus. Calling the distance of this particular focus v , the formula connecting the different quantities becomes

$$u^{-1} + v^{-1} = (\mu - 1)(r^{-1} + s^{-1}).$$

This is reduced to the first formula when $u = \infty$, or $u^{-1} = 0$. When the lens is plano-convex or plano-concave, the above formulae are made applicable by putting $s = \infty$, or $s^{-1} = 0$. The combination of lenses for optical purposes is studied under MICROSCOPE and TELESCOPE. See also REFLECTION, REFRACTION, SPECTRUM ANALYSIS, &c.

Optimism (from Lat. *optimum*, 'what is best') is that philosophical doctrine which affirms the world to be the best of all possible worlds, because God himself is absolutely perfect. The theory is as old as philosophy, but in its modern form, as embodied by Leibniz in his *Theodicea*, it differs from that of Plato and other ancients in considering the mind as a spiritual machine predetermined in all its actions. In all former ages the perfection of Deity stood side by side with the freedom of man. The arguments for and against O. are now perceived to be as baseless as those of the scholastic philosophy, and no longer interest mankind. See *Pessimism: a History and a Criticism*, by Jas. Sully (Lond. 1877).

Opuntia. See PRICKLY PEAR.

Opus Operantis (Lat. 'the act of the performer') and **Opus Operatum** (Lat. 'the thing done') are two phrases which began to be used in the Middle Ages to express the way in which the sacraments of the Church were to be regarded. Thomas Aquinas and others of the Schoolmen taught that in consequence of the death of Christ, the Sacraments of the New Testament have an instrumental and effectual virtue which those of the Old Testament had not. The latter were effectual only by the faith and piety of the recipient ('ex opere operantis'); the former in virtue of their inherent character as an ordinance of Christ appointed for our salvation ('ex opere operato a Christo,' from what was done by Christ). The error of the Schoolmen, of denying altogether the O. O., was condemned by the Augsburg Confession (1531), and their phraseology was modified in the decrees of Trent. The doctrine of the Church of Rome as expressed in the decrees of that Council and expounded by her ablest writers (e.g., Bellarmine), is as follows:—There is an inherent, supernatural virtue in the sacraments (*ex opere operato*); but willingness, faith, and penitence are also necessary in the recipients, not to the efficacy of the sacraments themselves, but because the want of faith would be an obstacle to the efficacy of the sacrament being exercised. The Reformed Churches hold the *opus operatum* to be nothing, and the *opus operantis* to be everything (cf. Westminster Confession and Catechism). The Lutherans agree with Roman Catholics in holding that there is a certain supernatural virtue in the sacraments; they differ from them in insisting on the presence of a different kind or degree of faith in the recipient. See Hodge's *Syst. Theol.* (Edin. 1873).

Or. See METALS, in Heraldry.

Orache, a word of doubtful derivation that was early applied to one of the species of *Atriplex*, and has now become attached to the genus. There are about 60 species in all, consisting of herbs or shrubs, with mealy or scaly stems and leaves and inconspicuous unisexual flowers. Many are weeds of cultivated and waste ground, others are peculiar to sea-shores, and like *Chenopodiaceae* in general they are in a botanical sense 'critical' plants. Of the seven species inhabiting Britain there is no occasion to remark. The garden O. or mountain spinach or French spinach (above referred to) is *A. hortensis*, a native of Turkey. It is a hardy annual about 3 feet high, with large hastate leaves varying from light green to red, which are used as a substitute for spinach. In France it is cultivated under the name *arache*. Though introduced into England as far back as 1548, it is not much grown.

Oracles (Lat. *oraculum*, from *os*, 'a mouth'; Gr. *manteion* and *chrēstērion*), among the ancients signified, first, the responses given by the gods to such as came to consult them, whether concerning the future or in a case of moral difficulty; and, secondly, the places where these responses were delivered. The gods were believed to manifest their will in different ways—through a human medium, or by signs, such as the rustling of the oak-leaves of Dodona, which were then interpreted by appointed priests. Zeus, though the primary source of all oracular revelations, was so far exalted above petty cares as to require Apollo and other lesser divinities, or even heroes, to interpose between himself and mankind. Hence there were only three O. directly consecrated to him, at Dodona (q. v.), Olympia, and

In the Libyan oasis of Sivah, against Apollo's twenty-three O. of Delphi (q. v.), Abæ, Ismenion, &c. Other famous Greek O. were those of Demeter at Patrae, of Hermes at Pharae, Trophœnus at Lebadeia, and Æsculapius at Epidaurus. The Romans resorted chiefly to Divination (q. v.), and in Italy we only meet with two O. of Faunus, one of Mars, and a few of Fortuna. The oracular responses were often enigmatical and ambiguous (Herod. i. 53, 62, 67); often based on a calculation of probabilities (Herod. i. 174; iv. 154); occasionally extorted by outer political influences (Herod. v. 63). Many again, recorded by the classic authors, were undoubtedly *ex post facto* predictions, e.g., those relating to Croesus and Leonidas. See Götze, *Das Delphische Orakel in seinem Politischen, Religiösen und Sittlichen Einfluss auf die Alte Welt* (Leips. 1839).

Oran' (Arab. *Waran*), a fortified seaport and capital of a province of the same name, in Algeria, is situated at the foot of a high mountain, 220 miles W. by S. of Algiers by rail. It is defended by several forts, and has many fine modern French buildings and boulevards. The harbour, Mers-el-Keber, has been greatly improved since 1864. There are extensive exports of esparto grass, feathers, tobacco, gums, &c., and imports of French cottons and hardware. In 1877 the esparto grass and other vegetable fibres exported to Great Britain for paper manufacture amounted to 40,000 tons. Pop. (1872) 40,674. Built on the site of the Roman *Unica Colonia* by the Moors, O. was taken by the Spaniards in 1509, by the Turks in 1708, and again in 1732 by the Spaniards. It fell to the French in 1831.—The province lies on the W. frontier of Algeria, and is partly included in the Tell, producing in considerable quantity wheat, maize, cotton, wine, tobacco, &c. Area, 33,246 sq. miles. Pop. (1875) 540,564, of whom 436,931 are Mohammedans, and only 41,191 French. The province is divided into the communes of O., Mostaganem, Mascara, and Sidi-bel-Abbès.

Orang' (*Pithecus* or *Simia Satyrus*) or 'Mias,' one of the four kinds of *Anthropoid* or man-like apes. It inhabits Borneo and

Orang-Outang.

Sumatra, and attains a height of from 4 to 4½ feet. The arms are very long, and measure in their outstretched span nearly twice the length of the animal. The arm and forearm are nearly equal in length, and the foot is very narrow and longer than the hand. The sole of the foot in the O. cannot be placed flat on the ground, the animal resting on the outer side of the foot when standing erect. The latter posture is not the natural position of the O., and is less easily assumed by it than by other apes. Both the thumb and the toe are short, and the great toe frequently wants the nail. The animal has twelve pairs of ribs; and the vertebrae of the back and loins (*dorso-lumbar vertebrae*) form a curve, which, as Huxley remarks, 'is nearly as much concave forwards as in a new-born child.' The brow-ridges in the O. are not markedly developed, and the jaws are largest in proportion to the cranium in the O. and gorilla. The bones of the nose are flat, and the hyoid or tongue-bone and the shoulder-blade are very like that of man. The female O. is smaller than the male. The volume of the brain in the O. is shaped at 26 or 27 cubic inches; about half the minimum size of the normal human brain (Huxley). The O. of all the apes 'come nearest to man in the number of the ribs, the form of the cerebral hemispheres, the diminution of the occipito-temporal sulcus of the brain, and the ossified styloid process; but it differs from him much more widely in other respects, and especially in the limbs, than the gorilla and chimpanzee do.' It is notable that in the young O. the head bears a remarkable likeness to that of the human infant; the subsequent lengthening of the face, and protrusion of the muzzle, however, completely altering and destroying this likeness. The O. spends its life almost exclusively on trees. Its hair is coarse, and of a reddish chestnut colour. It is long on the breast, face, and back. Although more than one species of O. is alleged to exist, the differences are probably merely *varietal* and not *specific*. When captured young, the O. may be readily domesticated, but even then does not lose all its natural ferocity.

Orange is the well-known, delicious, and wholesome fruit of a species of *Citrus* (q. v.) to which Linnaeus gave the name of *C. Aurantium*. Some botanists hold it, the citron, the lemon, the lime, and the shaddock to be all the offspring of one species, while others divide it into three or more. We shall here consider it as a species consisting of four sub-species. (1) The *Bitter* or *Seville O.*, marked by the petiole being generally winged, large and strongly scented flowers, a very aromatic rind, and a pulp bitter or austere. No O. is mentioned by Greek or Roman authors. The first notice is in Arab books of the 10th c., and it is highly probable that the fruit was brought from India to Arabia, Syria, and Egypt about the 9th c., and that by Arab conquest westward, the Crusaders, and Mediterranean trade it was distributed in S. Europe. It was extensively cultivated in Sicily and Spain in the 12th c. It is now grown in large orchards in Spain, &c., principally for the flowers, from which the essential oil of O. is distilled. The rind is used for candied O.-peel, and makes the best marmalade. (2) *Sweet* or *Common O.* has the leaf petiole naked or winged, sweet pulp, sometimes red, and a more or less adhesive rind. It was introduced into Europe at a much later date than the above; and it cannot yet be considered finally decided whether it came by way of Syria—which, however, seems probable—or whether the Portuguese imported it by sea from India or China. So much is certain, that on landing in India the Portuguese found it in abundance, a fact specially noted in the account of Vasco di Gama's voyage. At the present time it is grown all through the Mediterranean region, and is largely exported from Portugal, Spain, the Balearic Islands, Sardinia, Sicily, the Azores, &c. It is also cultivated to a large extent in the W. Indies, and within recent years has been exported from Florida and California. Two varieties of this deserving note are the St. Michael's O., with thin yellow rind and very sweet seedless pulp, and the blood or Malta O., with rough, round, reddish fruit, and pulp streaked with crimson. (3) *Mandarin O.*, a recent introduction from China. In this the fruit is small and flattened, and when ripe the thin skin readily separates from the delicious pulp. It is now grown in Malta, the Levant, and the Azores. (4) *Bergamot O.*, the flowers of which are small and very sweet-scented, the fruit globose or pear-shaped, the smooth rind pale yellow, with a pleasant-smelling acidulous pulp. Oil is obtained from the rind and flowers. The scientific names for the above-described four forms are *C. Bigaradia*, *C. Aurantium*, *C. nobilis*, and *C. Bergamia*. An orchard of O.-trees, with their rich glossy-green leaves and masses of golden fruit, is a very beautiful sight; and it is only when the fruit is plucked ripe from the tree that it can be perfectly enjoyed. Those exported are always gathered in an unripe state, to mature on the voyage. When grown near the coast, as in the Azores, a protection of high walls and belts of trees is required against the hurricane blasts that sweep up from the ocean. In Portugal, however, instead of high protection the trees are kept dwarfed. At ten years old a tree will bear from 1000 to 1500 oranges, and when in full vigour from 7000 to 8000; indeed as many as 20,000 have been gathered in a season from a single tree at St. Michael's. The O.-tree is, moreover, naturally long-lived, 100 to 150 years being the average; one existing at Rome is said to have been planted 1200 A.D., and some at Cordova are equally ancient. It is certain that a celebrated tree which died at Versailles in 1876 was raised from a seed given by the Queen of Navarre to her gardener at Pampeluna in 1421, as its existence all through the intervening period had been watched with historic interest. Under very suitable climatal conditions the O. attains a height of 50 feet, as, for instance, at Nice. In England it will not stand the winter, and is now generally grown simply as a conservatory ornament. The first essay at its cultivation was by Raleigh's relatives at Beddington, in Surrey, about the end of the 16th c. The trees then planted, after attaining 16 feet, were killed by the great frost of 1739-40. The consumption of the O. for food in various shapes is incalculable. That of the blossoms for perfumery purposes is also immense; at Nice alone amounting to nearly 200 tons yearly. The wood is yellowish, close and even grained, and hard; it is used for turning, engraving, inlaid and cabinet work, and excellent walking-sticks are made from the shoots and branches. The Native O. of Australia (*C. Planchonii*) is described as a noble tree of fully 40 feet high, with globular fruits about the size of a walnut.

Medicinal Properties.—The outer part of the rind of the ripe fruit of the *bitter O.*, *C. Bigaradia*, fresh and dried, is used in

medicine as a mild tonic, carminative, and stomachic, but principally as an addition to infusions and decoctions. The pharmaceutical preparations are the *infusion* (dose, 1 to 2 oz.), a *syrup*, and a *tincture* (dose, 1 to 2 drs.). O. wine, made in Britain, contains about 12 per cent. of alcohol and some free acid.

Orange, a colour, is composed of two of the primary colours, red and yellow. Among pigments the nearest colour to pure O. is cadmium yellow, but O. chrome (a sub-chromate of lead), O. vermilion, and other substances, are chiefly used in painting for O. In dyeing and calico-printing, O. colours are produced from red and yellow colouring matters applied together or separately.

Orange, a town of France, department of Vaucluse, on the Aigues, $\frac{1}{2}$ miles above its confluence with the Rhone, and 16 miles N. of Avignon by rail, has manufactures of silk and gloves, and carries on a trade in wine, truffles, honey, fruits, &c. Pop. (1872) 6290. The *Arausio* of the Romans, O. has remains of the triumphal arch of Marius (60 feet high), of an amphitheatre (capable of holding 7000 spectators), and of a cathedral (founded 529, and rebuilt 1176). From the 11th to the 16th c. O. was the capital of a small independent principality, which, on the death of its last sovereign, Philibert de Châlons, without issue (1531), passed to a younger branch of the house of Nassau (q. v.). Held by the Dutch stadtholders down to the death of William III. of England in 1702, it was then contested by Friedrich I. of Prussia and the Prince of Nassau-Siegen, but was ceded to France by the Peace of Utrecht (1713). The heir-presumptive to the throne of the Netherlands still bears the title Prince of O.

Orange, a town of New Jersey, U.S., 13 miles W. of New York, is picturesquely situated in an undulating country. Its chief industry is hating, which is extensively carried on. O. has 4 weekly newspapers. Pop. (1870) 9348.

Orange Institution, a politico-religious association which arose towards the close of the last century among the Protestants of northern Ireland. The first lodge was opened at Loughgall, in the county of Armagh, September 21, 1795, and the movement spread quickly, not only among the peasantry, but among the landowners, its objects being the promotion of the Union, and an organised opposition to the removal of Catholic disabilities. The rebellion of '98 was mainly due to the excesses of the English soldiers and Orange yeomanry, who in 1796 and 1797 marched over the country torturing the 'Croppies,' robbing, ravishing, and murdering—excesses that were sanctioned by the Insurrection Act and Bill of Indemnity. A grand lodge was founded at Dublin in November 1798, and at Manchester in 1808, whence it was transferred to London in 1821. From 1813 Orangism declined, till it was roused to fresh action by the question of Catholic Emancipation (q. v.). Its propagation extended to the army (1824) and to the colonies, and in 1827 the Duke of Cumberland (afterwards King of Hanover) accepted the grand-mastership. The celebration of the battle of the Boyne (July 1) was prohibited in 1832, as well as the assembling of any political association during the debates of Parliament. Since then the O. I. has assumed the character of a secret society, its clubs being formally suppressed by Government in 1836, when, according to Parliamentary Reports, they numbered 145,000 members in England, and 125,000 in Ireland. The repeal movement of 1848, and the Fenianism of recent years, have been warmly opposed by the Orangemen, who abroad have signalled themselves by their attempt to extort recognition from the Prince of Wales, on the occasion of his visit to Canada (1860), and by the New York riots, excited by a Boyne celebration, in which 50 persons were killed and 160 wounded, July 12, 1871.

Orange River or **Gariiep**, the largest river in S. Africa, rises in the Mont aux Sources, near 29° S. lat. and 30° E. long., and after a westerly course of nearly 1200 miles, during which it drains an area of 400,000 sq. miles, falls into the Atlantic in 28° 35' S. lat., and 16° 12' E. long. Its principal affluent is the Vaal River (q. v.), which is longer than the O. R. itself. The latter flows through a beautiful country in the upper part of its course, but after its junction with the Vaal traverses a region arid and dreary in the extreme, in its passage through which the volume of the river is considerably diminished by evaporation. Near its mouth the O. R. flows between gloomy, precipitous walls of rock. Frequent rapids and cataracts, and a sand-bar at its mouth, render it useless for purposes of navigation.

Orange River Free State, a region in S. Africa, lying between Cape Colony, the Transvaal, and Natal, and enclosed

by the Orange and Vaal rivers, and the Maluti and Drakenberg mountains. It is of a roughly oval shape, and has an area of about 55,000 sq. miles. Its surface consists of wide, treeless plains, dotted in some parts by small rocky hills called 'kopjes,' and gradually slopes to the edge of the great rim or wall of rock which shuts in Natal from the N.W. The average height of the country is 5000 feet above the sea-level, but the Montaux Sources, on the E. frontier, rises to 10,000 feet. The plains are clothed with grass, on which feed large herds of antelopes and other game, whose numbers however are being much reduced as settlement advances. Besides the two great streams of the Orange and Vaal rivers, the Free State is drained by a number of smaller ones, of which the Caledon is the most important. Deep and rapid in winter, they are reduced to small dimensions in the dry season. The climate is very dry, but healthy, and especially suited to persons suffering from pulmonary ailments. In winter the cold is often severe, and in summer thunderstorms are frequent. The scarcity of water is the chief drawback, and renders it necessary for each farm to have its reservoir. Large numbers of sheep are pastured, but as the Free State is 150 miles from the sea at its nearest point, the wool grown within it is shipped from ports in Natal or Cape Colony, and is included in their returns. Grain and fruits of all kinds are also largely grown. Diamonds and garnets are found near the western extremity of the Free State, but otherwise its mineral wealth is small.

The O. R. F. S. is a republic, and the only part of S. Africa where the Boers (q. v.) continue to maintain their independence. In 1836 a number of them migrated from Cape Colony into the Free State, from whence some went on to Natal. In 1842 the Free State was annexed to Cape Colony by one of the Judges of the latter, but the Governor disallowed the act a few weeks later. In 1845 the Boers went to war with the Griquas, who were allies of the British, and in 1848, after fighting, the Queen's sovereignty was proclaimed over the Free State, whereupon many of the Boers crossed the Vaal and founded the Transvaal Republic. In 1854 the Free State was restored to representatives of its inhabitants, and again became a republic. In 1868 its territory was extended to the S. by conquests in Basutoland, but in 1871 a large portion of Griqualand West was taken from it and proclaimed British territory, giving rise to a dispute which was not settled till 1876, when the President of the Free State came to London and arranged the matter with the Secretary of State for the Colonies. The Free State is divided into thirteen districts, and is governed by a President, who is elected every four years, and a Legislature termed the Volksraad. Dutch is the official language, and the prevailing religious denomination is the Dutch Reformed Church. Education is well cared for, but railways and telegraphs are still unknown. The Boers' mode of life is patriarchal in many of its leading features. The capital of the State is Bloemfontein, a well-built and thriving town, 680 miles N.E. of Cape Town. The revenue in 1874-75 was £100,958; the expenditure, £98,242; and the public debt, £58,915. The population was estimated in 1876 at 75,000, of whom about one-half are of European descent, chiefly Dutch. The natives are a mixture of many different tribes, the principal being Basutos, Koranas, and Bechuans (q. v.). See Hall's *South African Geography* (Lond. 2d ed. 1872); *Handbook to South Africa* (Lond. 2d ed. 1876); Noble's *South Africa, Past and Present* (Lond. 1877).

Oratorio, a composition for voices and instruments, consisting of a series of airs, recitatives, duets, choruses, &c., illustrating a Scriptural or sacred subject, and cast in a narrative or dramatic form. The Italian form of O. probably sprung from the Mystery Plays of the Middle Ages, and was originally produced with scenery and dramatic action. Filippo Neri, founder of the *Congregazioni dell' O.* (whence probably the name O. is derived), under the direction of Giovanni Animuccia, his Maestro di Capella, introduced settings of psalms and hymns in the madrigal style into the Church services, a collection of these *Laudi Spirituali* being published in 1571. Afterwards Scripture songs and incidents were formed into dramatic poems, and sung before and after the sermon. The earliest elaborate O. we know of is *La Rappresentazione di Animo e di Corpo*, the music by Emilio del Cavaliere, and the recitatives by Jacopo Peri, which was performed on a stage in the oratory of Santa Maria della Vallicella at Rome, with scenery, costumes, and dances, in the year 1600. The instruments were a double lyre, double guitar, harpsichord, and two flutes. Madrigals commenced and concluded the O. A con-

considerable number of such works were afterwards produced. Stradella's *San Giovanni Battista* (1670) was a great improvement on former sacred compositions, particularly in scoring. Carissimi also did much to advance this form of music, using stringed accompaniments, and introducing an improved form of recitative, upon which Handel modelled his style. Scarlatti, Leonardo Leo, Caldara, Hasse, Pergolesi, and Jomelli were among the leading composers of the Italian school of O., which gave way about the middle of the 18th c. to that of Germany. In the Lutheran Church, cantatas with instrumental accompaniments were sung, containing chorales for the entire congregation to join in. All Johann Sebastian Bach's great sacred works were of this nature, his *Passions-Musik nach den Heil-Matthæus* being probably the most magnificent example. Handel's first O., *La Resurrection*, was produced in Italy in 1706. Twenty-seven years later his first English O., *Esther*, was brought out (without stage-action) at the King's Theatre in the Haymarket. Among his many glorious and immortal works, *Israel in Egypt* (1738) excels in choruses; while the *Messiah* (1741) has a sublimity, grandeur, and completeness worthy of its transcendent subject. Broad choral writing was this grand composer's forte; and, though some of his arias are borrowed from Italian sources, many of his own have rare sweetness and beauty. In his day the orchestra was in a primitive state, and in the modern performance of his works additional instrumental accompaniments are used. What Mozart did in this way for the *Messiah* has been attempted by Macfarren, Costa, Sullivan, &c., for other works. Four of Haydn's works have been described as oratorios, of which *The Creation* (1798) excels in brightness and power. Beethoven's only O., *The Mount of Olives*, is cast in a dramatic form, requiring stage accessories for adequate representation. Spohr's *Crucifixion*, *Last Judgment*, and *Fall of Babylon* abound in beautiful melodies. By far the grandest modern specimens of this work are Mendelssohn's *Elijah* (1836), and *St. Paul* (1846). The former is full of dramatic fire, the latter of noble and effective harmonies. Sir Michael Costa's *Eli* and *Naaman*, Sir W. Sterndale Bennett's *Woman of Samaria*, Professor Macfarren's *St. John the Baptist*, and *Joseph*, and Dr. Arthur Sullivan's *Prodigal Son*, are among the most popular of recent sacred compositions produced in Britain, where the O. has taken deeper root than in any other country. It is the one form of music of which we can justly be proud as a nation. Nowhere is it produced with such completeness or success as in England. The Handel Triennial Festivals, which originated in 1857, and of which seven have been held at the Crystal Palace, are unequalled in choral splendour. They extend over four days, the audience nearly always approaching, and sometimes exceeding, 20,000 people. At the last performance (1877) the chorus numbered 2921 selected singers from choirs from all parts of the country (748 sopranos, 799 altos, 674 tenors, and 700 basses), and the orchestra 447 performers.

Oratorium (Lat. 'house or place of prayer,' cf. Matt. xxi. 13, Is. lvi. 7) was a name anciently given to Christian churches. At a later time the name was restricted to private chapels, differing from parochial churches in being only places of prayer, in which the Eucharist could not be celebrated; or if that was allowed to be done at ordinary times, the worshippers were to attend the parochial church on the great festivals. See Bingham's *Ecl. Ants.*

Oratory, Fathers of the, were an order or congregation of priests founded at Rome by Filippo Neri (q. v.), which was sanctioned by the Pope, 1577. Their first work was to provide shelter for the numerous pilgrims who flocked to Rome, which they did in hospitals. They derive their name from the circumstance that their religious exercises consisted of prayer, without the sacrament of the Eucharist (see ORATORIUM), and instruction in Church history and practical religion and morality. In short, the fraternities were of the nature of schools for pastoral theology. The order has accordingly produced a number of celebrated Church historians—e.g., Baronius (who succeeded Neri as general), Olderic, Rainaldi, Laderchi, &c. Another congregation, called the Fathers of the Oratory of the Holy Jesus, was established in France by Pierre de Berulle, and sanctioned by the Pope, 1613. They differed from the Italian congregation in not giving their attention specially to Church history, but to all branches of learning. This religious order was introduced into England by John Henry Newman in 1847.

Orbit, in Astronomy, is the path of a heavenly body round its primary, such as planets and comets round the sun, and satellites round their planets. Such an orbit is in every case a conic section, ordinarily an ellipse, which, however, presents irregularities of form due to perturbing influences of other bodies. To fix an orbit, it is necessary to know first the plane in which it lies. For this two numbers are requisite—its inclination to a fixed plane (the ecliptic, for instance), and the line of intersection of the two planes or line of nodes. This line is known if the longitude or position on the ecliptic line of one node (the ascending is universally used) is known. (See NODES.) Next, we must know the position and size of the orbit on the plane. For this three other numbers are necessary—the heliocentric longitude of the perihelion, i.e., the position of the nearer extremity of the major to the sun, the length of the major axis, and the eccentricity. Knowing these, with the time of perihelion passage, and the orbital velocity, a planet's motion is completely determined.

Orbulina, a simple form of *Foraminifera* (q. v.), occurring both in existing seas and as a fossil organism. The shell of the O. is a simple sphere of lime, through *foramina* or apertures in the wall of which, the prolongations of the soft protoplasmic body of the living animal are protruded.

Orceine is the principal colouring matter present in Archil (q. v.) and Cudbear (q. v.). It is formed during the preparation of these from lichens, and has a composition represented by the formula $C_7H_7NO_3$. The white gelatinous precipitate obtained by neutralising with hydrochloric acid the filtered solution of the lichens digested with lime and water consists of one or more acids, which, if boiled in excess of lime or baryta, are decomposed, yielding ultimately prismatic crystals of *orcin* ($C_7H_5O_3$); and this colourless substance, when exposed to the joint action of ammonia and air, is converted into O., which is of a beautiful red colour.

Orchard (Old Eng. *ortgeard*, lit. 'a yard or enclosure for roots'; comp. Old Ger. *wurzgarte*), the name given to a tract of ground specially set apart for the cultivation of hardy fruit-trees. Three things must be considered in the selection—climate, soil, and aspect. Thus, though apple-trees will endure a winter of greater severity than is generally experienced in any part of the British Islands, yet to bring the fruit to maturity requires a warm summer, and, therefore, the S. and W. counties are more favourable to apple orchards than the N. and E. As to soils, the apple has a predilection, so to speak, for such as abound in clays and marls; the pear will grow and produce great crops of fruit in dry, light, sandy soils that are not favourable for apple; while plums and cherries are less choice than either as to the soil upon which they grow. With regard to aspect, districts are favourable to orchards which have more or less an undulating surface, and therefore present numerous localities whose sheltered, and, at the same time, sunny aspects are favourable both for the setting and the ripening of the fruit. Very open or elevated and exposed situations, and the bottoms of deep-sunk valleys, are almost equally unfavourable; the first, from the violence of the winds and low temperature; and the latter from their liability to cold fogs and late frosts while the trees are in blossom. A situation much surrounded, or closely hemmed in by woods or plantations, is almost equally objectionable, as fogs dissipate much more slowly than over open ground. In the purchase of young trees or in grafting, in order to form a productive and profitable O., care must be taken to select good sorts, which are either new or in the vigour of their bearing. The trees should be planted at a distance of from 40 to 60 feet apart, according to the richness of the soil; for it should always be remembered that the roots extend far beyond the branches. The rows should run N. to S., in order that the trees may derive the greatest benefit from the sun. If it be indispensable to stock the O. occasionally with large cattle, the trees must be fenced, and when the fences are no longer deemed necessary for the support and protection of the young trees, it is proper to guard against injury from cattle by smearing the stems with lime and cow-dung. The bearing capabilities of aged trees may be much improved by judicious pruning. A return for 1877 gives the acreage of orchards in Britain as 165,003.

Stealing from Orchards—The law applicable to this offence is the same as that regarding stealing from gardens (see GARDENS,

STEALING FROM. In Scotland, the offence is against the Acts for Planting and Inclosing (q. v.) and is cognizable by the sheriff.

Orchard House is the name given to glass structures designed for the cultivation of various superior table fruits, and may be either erected against a wall with roof sloping to the sun, or be an elegant movable structure of glass, with iron supports and a double sloping roof. The fruit trees, be they peaches, nectarines, plums, pears, &c., are all grown in pots (15 in. inner diameter is a good size), with a hole sufficiently large in the bottom for the roots to work their way into a carefully prepared sub-stratum. By judicious attention to the setting of the fruit, pruning, ventilation, and temperature, a long succession of crops may be maintained, if the earliest and the latest kind are kept under cultivation. After the fruit is gathered the exserted roots are cut off level with the base of the pot, and the tree is then set aside for its winter rest. Shelves to grow early strawberries upon are a useful adjunct. The O. H. is a comparatively modern idea or invention, first suggested by the late Mr. Rivers (died 1877), in his pamphlet *The Orchard House*, and is now a favourite with many amateurs.

Orchardson, William Quiller, R.A., was born at Edinburgh in 1835, studied at the Academy there, and, after having gained a reputation as a painter of popular figure subjects, proceeded to London in 1863. His best-known works are 'An Old English Song,' 'Flowers of the Forest,' 'Hamlet and Ophelia,' 'The Challenger,' 'Christopher Sly,' 'Day Dreams,' 'Toilers of the Sea,' 'A Hundred Years Ago,' 'On the Grand Canal, Venice' (1871), 'The Casus Belli' (1872), 'The Protector and Cinderella' (1873), 'Hamlet and the King,' and 'Ophelia' (1874), 'Too Good to be True,' and 'Moonlight on the Lagoons' (1875). O. was elected an A.R.A. in 1868, and an R.A. in December 1877.

Orchestra (lit. 'the dancing place' in the Greek theatre) now denotes (1) an instrumental band in which stringed instruments predominate, (2) the space set apart in theatres and concert-rooms for the accommodation of the band and chorus.

(1) Modern orchestras are of all kinds of sizes and combinations according to the resources at command, the scale of performance, and the character of the works attempted. An idea of the ordinary proportions of musical instruments employed may be gathered from the article Music (q. v.). As a general rule the first and second violins are nearly equal in number, and it is usual to have about two-thirds of that number of violas, violoncellos, and double basses. The various wind instruments are in much smaller proportion, and still less so are the instruments of percussion. In a musical score a complete harmony is written for the strings alone, the occasional substitution or accompaniment of the other instruments opening a wide field to the composer's ingenuity. In a grand O. the first violins are arrayed to the right of the conductor, the second violins to his left, the flutes, clarionets, and wooden wind instruments behind him, the position of the violas is variable, the double basses and violoncellos are at the extremities: the right and left and at the centre, and the brass instruments at one of the extremities, having behind them the battery, or instruments of percussion. In a small O. the sizes of the wind instruments should be proportionate to the reduced number of strings. The elaborateness of the modern O. is the growth of the last century. In Claude Monteverde's opera of *Orfeo* (1604) 17 violins and 12 wind instruments were employed, and a particular instrument accompanied each person of the drama—the bass, Orpheus, the trombone, Pluto, &c.—an idea to some extent revived by Richard Wagner. Handel employed 4 oboes to 6 violins, but after his time the use of wind instruments in an O. fell out of fashion. In opera, strings and an organ were used for accompaniments, and the harpsichord for recitatives, the musician at the latter instrument acting as conductor, instead of the present independent timebeater. Glück revived the use of wind instruments, and made improvements in the treatment of others. Under the three representative composers, Haydn, Mozart, and Beethoven, orchestral music attained its highest splendour. The introduction of new instruments has been hindered by the difficulty of finding skilled players, as few musicians care to learn a speculative branch of the art. Meyerbeer was perhaps most successful in obtaining such enthusiasts. Many composers have shown in their orchestral writings a partiality for particular instruments, as Weber for the horn and Spohr for the violin. The excessive

use of cymbals, drums, &c., made by many modern writers, is to be condemned as detracting from the beauty and delicacy of the other instruments.

(2) The O. in a theatre is in front, or, as in some modern London houses, under the stage. Wagner adopted the latter position in the Bayreuth festival in 1876, in order to preserve more perfectly the stage illusion. In a concert room the O. is a raised platform, ascending by steps at the end of the hall. The chorus range themselves behind the band, the female voices being usually in the centre and the male voices on either side.

Orchidaceæ or **Orchidææ** is a large, diversified, and remarkable order of monocotyledons, represented throughout the world, excepting where frost and aridity are supreme, and found in all situations but maritime and aquatic. The number of described species is considerably over 3000. The term ORCHID is popularly applied to the whole. In temperate countries they are of terrestrial habit; in warmer latitudes, where they flourish in the greatest variety and profusion, they no longer seek their nutriment from the soil, but grow on trees or attach themselves to rocks and stones. The British species (numbering 42 in 18 genera) have a tuberous root and annual herbaceous stem. The tropical species on the contrary have often a perennial, and some of them a climbing stem, or peculiar aerial *pseudo-bulbs*. The amplexicaul or sheathing leaves are always entire, fleshy, or succulent, rarely scale-like. Flowers usually in spikes, racemes, or panicles, consisting of two whorls, each of three parts. The inner of these is always irregular, its lower segment—the *lip* or *labellum*—being usually larger and often spurred. The stamens are confluent with the style into an unsymmetrical column, upon which the anthers are so placed as to stand above the viscid stigma. Only a few have pollen grains perfectly distinct, usually they are united together in fours, and these again into granular masses, or the grains are combined into a stalked club-like mass (*pollinium*) within each anther lobe. The fruit is a three-valved capsule, the valves separating from the septa, and the innumerable minute seeds have a netted, membranous outer covering. The flowers of many of the O. assume such unusual figures that there is scarcely a common reptile or insect to which some of them have not been likened. This fantastic form of the flower, their exquisite perfume (in many species), the blending of gorgeous colours of a great number, the curious irritability of the labellum, the marvellous contrivances to obtain fertilisation, together with a general appearance so different to other plants, have combined of late years to render their cultivation a supreme attraction to amateurs. The practical knowledge of them may be said to have sprung up in the present century, and to have risen to maturity during the last thirty years. Now there are hothouses specially devoted to their culture, and £100 or more is not an uncommon price to be paid for a single plant of some great rarity. A few are valued for the beauty of their leaves, as, e.g., the Ceylon 'king of the woods' (*Anactochilus setaceus*), which has them netted with gold as on a groundwork of rich brown velvet. Mr. Darwin says, 'An immense proportion of the species are sterile if insects are excluded' from them. See his fascinating work *On the Fertilisation of Orchids*.

Orchis is the type genus of *Orchidaceæ* (q. v.). There are about 70 species, all belonging to the northern hemisphere. Of these, 12 are natives of Britain, 4 of which are common plants, at the same time sufficiently handsome and curious to attract general attention in the spring and summer months. They are called the green-winged O., purple O., marsh O., and spotted O. The others are very rare, being restricted to chalk soil, and one, named *O. hircina* or lizard O., has been met with only sparingly and at long intervals in Kent. When Linnaeus defined the genus O. he included in it many plants now divided into separate genera, so that the fragrant O. has become *Gymnadenia*, the butterfly and frog O. are *Habenaria*, the musk O. is *Herminium*, the man O. is *Aceras*, and the bee, fly, and spider O. belong to *Ophrys*. All the animal names have been given to the plants from a resemblance (more or less correct) of their flowers to the object specified. The four last are in Britain almost confined to the chalk and limestone districts of England. The three first are not uncommon. See **SALEP**.

Orchitis, or **Inflammation of the Testicle**, appears first in the intertubular connective tissue, but afterwards the tubuli themselves became loaded with lymph. O. may be

caused by a blow, by metastasis in mumps, gonorrhoea, syphilis, &c. The *acute* form commences with rigors, sickening pain in the back and loins, as also in the testicles, heat and redness of the scrotum, swelling and tenderness of the epididymis, and distension of the tunica vaginalis. The treatment consists of rest in bed with the part supported, warm cataplasms, and leeches followed by warm bathing. Careful strapping of the organ is also beneficial. *Chronic O.* consists in a knotty enlargement of the various lobes of the gland, caused by infiltration of lymph into their connective tissue. It is best treated by keeping the patient in bed, and administering calomel and opium till the gums are slightly tender. This treatment should be followed by inunction of mercurial ointment into the scrotum, and the administration of iodide of potassium internally. *Scrofulous O.* occurs in persons of the strumous diathesis, and consists in the deposit of tubercle in and around the tubular structure, and is usually accompanied with enlargement of the vas deferens. The tubercles generally soften and terminate in the formation of abscess. The constitutional treatment is hygienic and dietetic, and the local treatment is that common to suppurating sores. Phosphorised cod-liver oil should be given. See TESTICLE, DISEASES OF.

Orchomēnos, the name of two ancient Greek cities, of which the **Minyan O.**, in the N. of Boeotia, stood on a hill, overlooking Lake Copais, and with the Cephissus 'winding like a serpent' about its southern base. Within its walls, 2 miles in circumference, were the famous Treasury of Atreus, the Acropolis, and a temple of Dionysus. The seat of the Minyæ and Phlegyæ, O. is celebrated by Homer for its wealth, and by Pindar for its musical contests. In the Peloponnesian War it sided with Thebes, but on that city's adoption of a democracy, O. joined the Spartans, and in 338 B.C. was destroyed by the Thebans, who thenceforth remained its inveterate foes. Twice restored and twice destroyed, O. was finally rebuilt by Philip of Macedon (338 B.C.). Its ruins are still to be seen near the village of Skripou. See K. O. Müller's *O. und die Minyer*, and Colonel Mure's *Tour in Greece*.—The **Arcadian O.**, lying to the N. of Mantinea, near the modern village of Kalpáki, had an acropolis, built on a rock 3000 feet high, and temples of Poseidon and Aphrodite. In ancient times it was one of the chief cities of Arcadia, and it retained its kings down to the Peloponnesian War. It was captured by Cassander (331 B.C.), and later by Cleomenes and Antigonus Doson.

Orcin. See ORCEINE.

Ordeal (Old Eng. *orddel*, from *or*, 'a beginning' or 'origin,' and *deal*, a 'separation,' hence a judgment; 'a first or primitive mode of dealing' out judgment; comp. Dut. *oordeel* and Ger. *urtheil*) is the name given to a mode of trial which was not unknown to the ancients, was familiar in the Middle Ages, and is still practised in many parts of the world. We read in Numbers (v. 19-28) of an O. of bitter water which caused the thigh of the unfaithful wife to rot and her abdomen to swell and burst. Here the accused specially agreed beforehand that the Lord should do these things. Sophocles mentions the use of fire among the Greeks. There were special ordeals of virginity, such as carrying water in a sieve, or the drawing of a ship by the girdle, which *Bona Dea* enabled Clodia to do at Rome. The O. was generally supported by oaths. Sometimes an oath written on a tablet was cast into the water, if it sank, the oath was false. In the Old English laws of Æthelred we find 'the Church paying special attention to the O. by red hot bars or boiling water, the ceremony being introduced by fasting and an elaborate service, and the limbs being examined after an interval of three days. The water O. is recognised by the assizes of Clarendon and Northampton; it was gradually transferred from the church to a trench or pit outside, and was abolished in 1219. Orthodox priests frequently gained triumphs over heretics and infidels by referring a point of dogma to some such test. In Tibet a black and a white stone were thrown into boiling water, the innocent person was sure to draw out the white one. The *Lex Ripuaria* says that if a serf withdraw his hand from the fire unburned, his master is held guilty of the theft with which the serf is charged. By an ancient Irish custom the chief who offered an expiatory sacrifice walked thrice barefoot over the burning cairn to give the entrails of the victims to the Druids. This may have been a test whether the sacrifice was favourably received. Sometimes the red hot iron was prepared in the form of a glove into which the arm was thrust

up to the elbow. Something like the Indian marsh was the Scandinavian earth-trial, the accused lay down beneath a roll of turf, if this fell on them they were perjurers (Müller's *Laxdalla Saga*, and Arneseir's *Íslandske Rættargang*). Elsewhere the perjurers' hands were said to blacken at the moment of the oath and the relic to seize them. Thus in the romance Reynard the fox is obliged to swear on the teeth of a saint, and a dog, who plays the saint, tries to bite him; in the Edda, Thor swears with his hand on the throat of the wolf Fenrir. In the same way blood flowed from the dead bodies of murdered persons when the murderer was brought near, after having sworn his innocence. Church rules often prescribed a fast for three days on a handful of barley and some salt and water. By an old French custom when a theft was committed, the local magistrates at a meeting of the inhabitants, after having called forth the thief, held up a stick under which every one must pass, but which the thief never had the courage to pass. This resembled the Dyak custom of hanging up an arch of tigers' teeth. In Madagascar the drinking of the water of the tangena nut is frequently resorted to, but the draught is sometimes administered to two fowls representing the accused and the accuser. Generally in S. Africa if a goblet full of Mbundu juice does not at once act as an emetic the guilt of the accused is proved. This reminds one of the 'corsnaed,' or consecrated bread and cheese, which the Old English priests sometimes administered, and which only the innocent could swallow. If a priest were accused, he merely made oath on the 'house,' or sacramental bread. There are still among the Dravidic races of India nine different kinds of O., poison, fire, water, and the scales, used for thefts of different degrees of gravity; the cold water test, which consisted in keeping the accused between two jets of water while another shot an arrow and went to fetch it; water in which an idol has been washed, rice, boiling oil, red hot iron, the image of iron and silver. Most of these tests simply rely on a supposed divine intervention with natural law in favour of an innocent person. According to Jakob Grimm (*Deutsche Rechtsalterthümer*), the modern duel is simply a relic of the O., or judgment of God; and as Beccaria has pointed out it resembles in principle the practice of torture, the only difference being that in the latter the event depends on the will of the accused, and a man on the rack being as little able to declare the truth as in former times to prevent without fraud the effects of fire or boiling water. Space does not admit of any statement of the numerous frauds which were practised against the O. The practical result was to put justice into the hands of the priests, as compurgation put it into the hands of the friends of the accused. (The only full description of an English O. is the Petyt MSS. in the Inner Temple Library.) For the legal forms of O. in the Middle Ages, see *Pez, Thesaurus Anecdotorum Novissimus*, vol. ii. (1721-28).

Order, in *Zoology*, a division used in the classification of animals and plants. It results from the subdivision of a *class*. Thus the class of *Mammalia* or *Quadrupeds* is divided into *orders*, which, while agreeing in the characters of the class, yet present us with modifications of the class-type.

O., in *Botany*. If the resemblances and differences of *genera* are taken into account, those which resemble each other more than they do any other genera are collected together into groups of a higher degree called 'Natural Orders' or *Families*, and to each a common name is given. This name is in Latin an adjective plural, usually taken from some one *typical* genus, generally the best known, the first discovered, as the most marked *Orchidaceæ* from *Orchis*.

Order (Lat. *ordo*) meant originally a set form of prayer, and then the 'rule' or laws of a monastic institution; but secondarily, and in the more popular sense, it means all the monastic institutions, or the aggregate of monks, nuns, &c., who conform to the same rule. Religious orders have generally been classified as monastic, military, and mendicant. See MONACHISM, MENDICANT ORDERS, &c.

Ordericus Vitalis, a Latin chronicler of the 11th c., was born at Attingham, Shropshire, England, 15th February 1075. His father Odelirius was a native of Orleans who, at the time of the Norman Conquest, had followed Roger de Montgomery, afterwards Earl of Shrewsbury, to England. An access of religious fervour induced Odelirius to sacrifice his parental feelings, and, at the age of ten, his son was sent to Normandy that

he might be eternally severed from his father. O. was received into the Benedictine abbey of Ouche, founded by St. Evroult. On the 22d of September 1086, the Feast of St. Maurice, he received the tonsure, exchanging at the same time his English name 'Ordericus' for that of 'Vitalis,' a companion of the saint whose memory was that day celebrated. On the 21st December 1107 he received 'the burden of the priesthood.' Of his subsequent life nothing more is known than that he only thrice quitted his retreat—once to attend a general chapter of the Benedictine order, convoked by the abbot of Cluni, and twice to make journeys, one to Worcester and another to Cambrai, for the purpose of procuring information needful for his historical labours. He died in 1141 or 1142—the exact date is unknown. O.'s work entitled *Historia Ecclesiastica* is in thirteen books, the greater part of which are devoted to Norman and English history. 'No work,' says M. Guizot, 'contains so much and so valuable information on the history of the 11th and 12th centuries, on the political state, both civil and religious, of society in the W. of Europe, and on the manners of the times, whether feudal, monastic, or popular.' The first edition was printed at Paris (1619) in Duchesne's *Historia Normannorum Scriptores Antiqui*. By far the most accurate edition is that by M. Auguste Le Prevost (Par. 1838), based on a laborious collation of the best MSS., and illustrated by a vast number of valuable notes. An English translation in 4 vols. of Le Prevost's edition by Thomas Forester is contained in Bohn's *Antiquarian Library*.

Orderlies. In the army non-commissioned officers who receive the regimental or general orders and communicate them to their respective companies. Commissioned officers charged with the superintendence of barrack arrangements are called orderly officers.

Orders, in Architecture, the styles recognised by the ancients for the erection and embellishment of a column (q. v.) were five in number—viz., three Greek, the Doric, Ionic, and Corinthian, and two Roman, the Tuscan and Composite.

Orders, Army, are of three kinds—those issued by the commander-in-chief to the whole army, by the general in charge of a division or brigade to the forces under his command, or by a colonel to his regiment.

Orders, Holy. In the early Christian Church all who had any public employment in the Church were called by the common name of 'clergy' (Lat. *clerici*, from Gr. *klēros*, 'a lot'), 'canons' (Lat. *canonici*, from Gr. *kanōn*, a roll in which their names were entered), 'the holy ones,' 'the holy order,' 'the order of the sanctuary,' &c. The clergy were afterwards distinguished into three orders—the bishops, presbyters or priests, and deacons. Next, in the 3d c., certain minor unconsecrated orders were instituted, to attend upon the ministers in divine service, and serve as a kind of nursery for the sacred O. of the hierarchy. These were sub-deacons, whose original duty was to prepare the sacred vessels and utensils of the altar, and deliver them to the deacon in time of divine service; acolythists or acolyths (Gr. *akolouthos*, 'an attendant'), an order for four centuries peculiar to the Latin Church, whose original duties were to light the candles in the church and bring the cruets of wine and water to the celebrant of the Eucharist; exorcists, to cast out devils from the possessed; readers, whose office was to read the Scriptures, not at the altar, but in the reading-desk; doorkeepers or porters, whose duties were to open and shut the doors under the direction of the deacons or those who had the charge of separating the faithful from the catechumens and the excommunicated.

In the Presbyterian Churches the one order of presbyters is now retained; in the Anglican Church the three, of bishops, priests, and deacons. In both the Greek and the Roman Catholic Churches there is a distinction made between the major or H. O.—bishop, priest, and deacon; and the minor O.—acolyth, exorcist, reader, and doorkeeper. To the former belongs an indelible, sacramental character; 'O.' being one of the seven sacraments of the Church.

Orders in Council. The sovereign of the United Kingdom is authorised by Parliament to issue and enforce executive orders, under defined limits, with the advice of the Privy Council (q. v.). These are called O. in C. Emergencies occur in which, for the welfare of the state, these limits are overstepped, the advisers of the crown relying on Parliament passing an act of indemnity.

O. in C. are issued largely in matters connected with the trade of the country, and under international questions. For an instance of the latter, see *International Copyright*, under COPYRIGHT, LAW OF. A law cannot be enacted by an O. in C., but power may be delegated by Parliament to the sovereign in council to suspend a law, or to put a law in force, according to circumstances; thus, at the close of the session of 1876, an Act was hastily passed enabling the Queen, with the advice of her council, to adopt most stringent measures to prevent the spread of the Colorado beetle, should it appear in the United Kingdom. Several O. in C. have become historical. Such are the orders of 1807 and 1809, by which Great Britain endeavoured to meet Napoleon's Berlin and Milan decrees, declaring the British Islands and British dominions to be under blockade, and ships trading with them to be, accordingly, liable to capture by the ships of France. The British counter-order declared all neutral vessels trading from one hostile port of Europe to another with property belonging to an enemy, to be liable to seizure. The legality of these O. in C. has been doubted, owing to their being contrary to the international law of *Blockade* (q. v.).

Ordinal is a book containing the forms observed by the Church in ordaining or consecrating the clergy. The O. of the Anglican Church was drawn up and added to the Book of Common Prayer in the reign of Edward VI., revised in the reign of Elizabeth, and re-revised by the Convocation of 1661.

Ordinaries, in Heraldry, the charges most commonly in use, of which the simpler forms were regarded as the most ancient and honourable. The Honourable O., composed of straight lines, were nine in number, the chief, pale, bend, bend sinister, fesse, bar, cross, saltire, and chevron, all which are noticed in separate articles.

Ordinary is an ecclesiastical superior who by right, privilege, or custom, exercises authority or jurisdiction, but more particularly a bishop who, in matters of order and special dispensation, has ordinary jurisdiction within his diocese. In matters of jurisdiction the O. is he that has ordinary jurisdiction, as a judge or magistrate. The name thus applies to a chapter as regards the canons, a dean, or an archbishop in visitation. Archdeacons, vicars-general, and chancellors of dioceses are each a local O., as are all officials who, although acting only by commission, have ordinary jurisdiction in their capacity of ecclesiastical judges.

Ordinary, a term of civil law for any judge or bishop who has authority to take cognizance of causes in his own right, and not by deputation. The O. of Newgate is the chaplain attendant in *ordinary* upon condemned malefactors in the prison. In Scotland, the Lords O. are certain judges of the Court of Session (q. v.).

Ordinary (navy). Her Majesty's ships are 'in O.' when not in actual service. They usually lie in or near the royal dockyards ready for equipment on an emergency. An O. seaman is one who has not served long enough to be called an able seaman, and who is not considered capable of performing certain of the latter's duties. The pay of an O. seaman in the Royal Navy is 1s. 3d. a day for continuous, and 1s. 1d. for non-continuous service.

Ordination is the ceremony by which the clergy are admitted into any particular order, and consecrated to perform the office of that order. The Jewish priests were consecrated to their office by pouring oil on their head. The essential part of the apostolic ceremony, as described in the New Testament (cf. Acts viii. 18), was, as it is yet, the laying on of hands. This act is symbolical of conveying the Holy Spirit from the person or persons ordaining to the ordained, which was done first by Christ breathing upon the Apostles (John xx. 22). In Episcopal churches the deacons are now ordained by the bishop, the priests by the bishop and all the priests present, and the bishops by the archbishop and two or more bishops, or by three or more bishops. The inferior orders were never ordained to their office at the altar, or with the laying on of hands. In Presbyterian churches ministers are ordained by the laying on of the hands of the presbytery. Some Protestant sects have no O. at all.

Ordinance, a military term usually applied to the larger kinds of guns in use. See ARTILLERY, CANNON, CANNONADE, HOWITZER, MITRAILLEUSE, MORTAR, RIFLED ARTILLERY, &c.

Ordnance Department, an ancient but now obsolete department of the Government, which had control of the artillery and engineers, the furnishing of the entire army with guns, ammunition, &c., and the supervision of fortifications and military works. Since 1855 its functions have been in the hands of the War Office. See **BOARD OF ORDNANCE**.

Ordnance Survey is one of the sub-departments of the Board of Works, to which it was transferred by the Survey Act, passed May 12, 1870. It embraces all the operations necessary for a complete trigonometrical survey of Great Britain and Ireland, and the preparation of maps and plans of all parts of the kingdom. The idea of taking a general survey of the country was first proposed after the rebellion of 1745, when the want of anything like an accurate map of the Highlands was severely felt by the Government troops. In 1755 a first map was completed by Major-General Roy, but never published. In 1783 Roy began a similar survey of England, measuring carefully a base-line on Hounslow Heath, near London. The work was continued by General Colby, who remeasured the base-line with great care in 1791. Operations were suspended during the early years of the present century, and the maps, constructed chiefly for military purposes, were, especially the earlier ones, far from accurate. In 1809 the triangulation of Scotland was begun, and continued with several breaks till 1823, when it was suspended for fifteen years. In 1824 the survey of Ireland was begun, and finished in 1840, and six-inch maps, or maps on a scale of six inches to the mile, for the whole country, were published in 1845. The first portions were, however, imperfect, and a revision was deemed necessary. The six-inch county maps are all published, and the one-inch maps are all completed in outline, though nearly one-half of the country, with the hills engraved, has yet to be published. In 1838 the triangulation of Scotland was resumed, and in 1840 surveys for a six-inch map were begun for the northern parts of England. The tardiness displayed by the authorities in reference to the publication of both the one-inch and six-inch maps, roused much dissatisfaction in Scotland. The Committee of the House of Commons proposed stopping the six-inch map, and this led to a discussion of the relative merits of the six-inch and one-inch systems. In 1861 it was decided that counties should be published on the six-inch scale, and the whole kingdom on the one-inch scale. Extensive tracts of moorland and uncultivated land are published only on the one-inch scale, which is very convenient for travelling purposes. In 1877 the six-inch maps of Scotland, with the exception of those of the counties of Caithness, Sutherland, Ross, the Orkney and Shetland Islands, Harris, N. Uist, S. Uist, Skye, Mull, Islay, and other smaller islands, were published, and the one-inch maps are very little behind—a portion of Inverness and the W. portion of Argyshire being still incomplete. The one-inch maps of England and Wales are all published, but of these only those of the counties of Northumberland, Cumberland, Westmoreland, Durham, and York, have the hills engraved, and only these counties, together with Lancashire, Middlesex, Sussex, and part of Kent, Hampshire, Wiltshire, and Devonshire, are published on the six-inch scale. Parish ordnance maps are also in process of construction. These are on the scale of $\frac{1}{25,344}$ inches to the mile. About half of Scotland, a few counties of England, and a small part of Ireland have been so surveyed. Maps of the larger towns to the scale of 5 feet, and 10.58 feet to the mile are also being issued. Other nations of Europe are also busily engaged in the accurate mapping of their country; and the great importance of having accurate maps was clearly demonstrated in the Franco-Prussian war, when much of the success of the Germans was directly attributable to their knowledge of the country obtained solely from charts. The great trigonometrical survey of India is perhaps the most gigantic work of the kind, and in America the coast survey of the United States is in full operation. Surveys of Peru and Chili are also being carried on.

Oregon, one of the Pacific States of the American Union, is bounded N. by Washington, S. by Nevada and California, W. by the Pacific, and E. by Idaho. Area, 95,274 sq. miles; pop. (1875) 112,000, including 10,960 tribal Indians, 318 Indians paying taxes, 3330 Chinese, and 346 coloured persons. O. extends 360 miles from E. to W., and 275 from N. to S., and has a coast line of 300 miles. It is divided by the Cascade and Blue Mountains into Western, Middle, and Eastern O., and a lesser

range, some 50 miles from the coast, traverses the western section, nowhere attaining a height of over 4000 ft., and clad to the summit with forests. The Cascade Mountains, a continuation of the Sierra Nevada, rise in Mount Hood to a height of 11,225 ft.; in Mount Pitt or M'Laughlin to 11,000 ft.; and in Mount Jefferson to 10,200 ft. Middle O. is a rolling tableland, broken by spurs of the Blue Mountains, and the section E. of this range is a rugged region intersected by many fertile and beautiful valleys. The State is mainly confined on the N. by the river Columbia, and on the E. by its great affluent the Snake River. Other rivers of O., all tributaries of the Columbia, are the Willamette, John Day, Des Chutes, Grand Ronde, Malheur, and Owyhee. The Willamette Valley in the N.W. of the State (150 miles long by from 30 to 60 broad) has a soil of unusual productiveness, and contains the principal towns, and nearly two-thirds of the inhabitants. The Columbia is navigable, with two interruptions (the Cascades and Dalles) for 396 miles; the Willamette, during part of the year, for 138 miles. There are numerous lakes, some of them salt, in the S. and S.E. Eastern O. has been the scene of comparatively recent volcanic action, the terrific effects of which are visible in fissures or cañons 1500 feet deep, in mountains of amygdaloid, in heaps of volcanic conglomerate, and in cliffs of columnar basalt lining the river courses. The Blue Mountains and coast range are alike Eozoic; the intermediate Cascade range is volcanic, while Tertiary rocks prevail on the narrow sea-margins. In Middle and Eastern O., gold, silver, and coal are wrought. Among the wild animals are the grizzly bear, the black and cinnamon bear, the large wolf and coyote, the panther, and catamount; several species of deer, antelopes, elk, the racoon, porcupine, beaver, otter, &c. Seals and sturgeons are abundant in the Columbia, and most of the rivers abound with salmon, salmon-trout, &c. The larger birds are the golden and bald-headed eagles, cormorants, hawks, pelicans, buzzards, and vultures. The vegetation W. of the Cascade Mountains is luxuriant, and here grow many giant trees, as the O. cedar, often 15 feet in diameter, the lofty red-wood pines, larches, &c. Other trees are the oak, cottonwood, willow, and alder, while the arbutus, cornus, and hazels form a dense undergrowth. Splendid lunch-grass covers millions of acres. In Western O. both winter and summer are tempered by Pacific winds; E. of the Cascade Mountains there are greater extremes of climate, and the protracted winters are accompanied by heavy snows. Ice is rarely thicker than an inch in Western O., and the rainfall is not excessive. The mean annual temperature at Astoria is 52° 13' F., at Corvallis, 53° F. In 1875 the rainfall at Portland was 43.69 inches. In 1874 O. produced of wheat 4,875,000 bushels; of oats, 2,391,000; of barley, 371,000; of Indian corn, 94,000; of potatoes, 751,000; of flax seed, 25,000; of apples, 500,000; of wool, 2,000,000 lbs.; of butter, 1,800,000; of cheese, 250,000; of bacon and ham, 1,500,000—total value, \$8,161,240. In 1875 there were 85,500 horses, 105,000 cattle, 634,600 sheep, and 174,600 swine. In 1874 the export of canned salmon amounted to \$1,500,000; of wheat and flour to \$4,000,000; of gold, silver, coal, and iron, \$1,500,000; of timber, \$1,000,000; and of cattle, wool, and hides, \$2,000,000. The railways of O. had a stretch in 1877 of 251 miles. The claim of the United States to the territory of O. and Washington as far N. as lat. 54° 40' was resisted by Great Britain, and a 'treaty of joint occupation' was concluded in 1818. After a renewal of the dispute, which for a time seemed to threaten war, the boundary was settled on the 49th parallel in 1846. O. was organised as a territory in 1848, and as a State in 1859. There have been occasional troubles with the Indians, the latest being the 'Modoc War' in 1872.

Orel (pron. *Aryol*), a government of Middle Russia, lying S.W. of Smolensk, has an area of 1,804,100 sq. miles, and pop. (1870) of 1,596,881. The surface is mostly flat. Within the limits of O. rises the Oka, a tributary of the Volga, and through it flow the Desna and Sosna, whose waters swell the volume of the Dnieper and the Don. The soil is very fertile, but only five-eighths of the surface is under cultivation, while fully one-fourth is covered with forest. Great quantities of corn, hemp, hops, and fruit are raised, and tallow-boiling, glassmaking, linen-weaving, and tanning are actively carried on.—O., capital of the government of the same name, is situated at the confluence of the Oka and the Orlik, 198 miles S.S.W. of Moscow, and is a station on the great railway from St. Petersburg to Odessa. It has also

direct communication with Riga. O. is the seat of a bishop, has 24 churches, but the houses are nearly all built of wood. It has manufactures of rope, yarns, and leather, and is a great emporium for the grain trade of the interior of Russia. Pop. (1870) 44,281.

Orelli, Johann Kaspar von, a Swiss philologist, born at Zürich, February 13, 1787, entered the Zürich *Carolinum* (1799), was ordained (1806), spent some months in Pestalozzi's institute at Yverdon, and held the post of Reformed pastor at Bergamo (1807-13). He became professor at Chur (1814), in the *Carolinum* of his native city (1819), and in its newly-founded university (1833). O. supported the Greeks in their struggle for independence by purse and pen, opposed the revolutionary movement of 1830, but was a warm advocate of reform in state and school. He died at Zürich, January 6, 1849. Among O.'s works were editions of Cicero (1826), Horace (1837), and Tacitus (1846), his *Inscriptionum Latinarum Collectio* (2 vols. Zür. 1828); and *Onomasticon Tullianum* (3 vols. Zür. 1836-38). See *Lebensabriss von J. K. von O.* (Zür. 1851).

Orenburg, a government in the S.E. of Russia, traversed throughout by the southern chains of the Ural mountains, on the Asiatic side of which most of the province lies, is partly bounded on the S. by the Ural River, and on the E. partly by the Tobol. Area, 73,890 sq. miles. Pop. (1873) 900,547, more than one half of whom are Bashkirs, Mescherjaks, and Teptjars. Where the land is not mountainous it consists of extensive steppes, which in the lower levels are admirably adapted and much used for grazing purposes, O. possessing a larger number of horses than any other Russian government. Agriculture is carried on in the river valleys to some extent; but the mineral wealth of the district constitutes its chief importance. Rich gold deposits are found near Mijaskoi, besides large quantities of copper and iron ore. This territory, known in the 16th c. as Bashkirei, submitted in 1556 to the Czar, and was formed into the government of O. in 1744. The Bashkirs are slowly giving up a nomadic or pastoral life, and taking to agriculture, for which a great part of the soil is well suited. See Mackenzie, Wallace's *Russia* (2 vols. Lond. 1877).—O., capital of the Russian government of the same name, upwards of 1390 miles S.E. of St. Petersburg, on the Ural River, in the midst of a barren steppe. It is the chief fortress on the O. frontier, the last important town on the great highway to Central Asia, and one of the principal markets for caravans coming from the Kirghis and Turkestan. The railway from Samara was extended to O. in 1877, thus connecting the town more closely with Moscow and Western Europe. The streets of O. are broad and unpaved; the houses lie far apart, being often separated from one another by fields. The great market-place has both an Asiatic and a European gate. O. possesses a cathedral, five Greek churches, a Lutheran meeting-house, and a gymnasium. Pop. (1873) 35,623.

Orense (Lat. *Aqua Originis*), a town of Galicia, in Spain, capital of a province of the same name, 56 miles S.S.W. of Lugo by rail, on the left bank of the Miño, which is here spanned by a seven-arched bridge, 147 feet high and 1398 feet long. It is the seat of a bishop, has a stately cathedral and two churches, and since the time of the Romans has been celebrated for its sulphurous hot springs, Las Burgas. There are manufactures of linen and chocolate, and a trade in wine and hams. Pop. 6872.—The province of O. has an area of 2737 sq. miles, and a pop. (1870) of 402,796.

Oreodaphne, a genus of the natural order *Lauracea*, and of which some of the species were formerly placed to *Laurus*. They inhabit tropical America principally, and form as a rule large trees. *O. Californica*, of the mountainous parts of California, has leaves pungently aromatic, which are locally used as a condiment. It has a variety of names, such as mountain laurel, spice-bush, &c. *O. epiphyra*, of the Orinoco district, yields oils that are used in rheumatism, &c., and as an application to tumours. *O. bullata*, of the Cape of Good Hope, gives a fine-grained, dark-coloured wood, much used for cabinet work. Its name of stink-wood denotes the offensive smell of the fresh-sawed timber.

Ores. By the general name ore (Dan. *ars*, 'a vein') is meant the combination or condition in which the metallic substances extracted by metallurgical processes are found in nature.

Few metals are obtained in their pure or metallic state, but gold, silver, mercury, and occasionally copper are so found; not unfrequently natural alloys of two or more of these metals are obtained. As a rule, however, metals are found in combination with non-metallic elements, oxygen and sulphur being the most frequent mineralising agents. More rarely arsenic and chlorine are found combined with the metallic elements, and many ores consist of complex mixtures of various compounds; oxide, sulphide, and chloride, of more than one metal being present in one ore. The method of preparing O., and extracting metals from them is described under METALLURGY, and under the names of the various metals. For the way in which they are mined see MINING.

Orfila, Mateo José Bonaventura, a famous physician and chemist, and the recognised founder of toxicology, was born at Mahon in the island of Minorca, April 24, 1787. From 1805 he studied medicine and the natural sciences successively at Valencia, Barcelona, Madrid, and finally at Paris, where in 1811 he began to practise, at the same time opening a course of lectures on chemistry, anatomy, and botany, which soon secured for him a wide reputation. He devoted himself chiefly to the study of poisons; and was elected professor of medicine and toxicology in the University of Paris in 1818, and Physician to the king in 1823. O. was a Grand Officer of the Legion of Honour, Dean of the Faculty of Medicine, and Member of the General Council of the Hospitals and of other authoritative bodies. At the revolution of 1848, he was deprived of his position; and soon after fell into ill-health, dying at Paris, March 12, 1853. His chief works are *Traité des Poisons ou Toxicologie générale* (2 vols. 1813; new edition under the title *Traité de Toxicologie* 1831), *Eléments de Chimie Médicale* (2 vols. 1817; 8th ed. 1851), *Secours à donner aux Personnes empoisonnées* (1818), *Leçons de Médecine légale* (2 vols. 1828; 4th ed. 1847), *Leçons de Chimie légale* (4 vols. 1846). O. bequeathed his scientific collections to the town of Angers, and 120,000 francs to the Académie de Médecine for prizes.

Organ, a compound wind-instrument composed of a large number of pipes of different forms, sizes, and materials, supplied with compressed air from bellows, and so attached to a keyboard that they may be made to emit musical sounds at the will of a performer. The term O. is derived from the Greek *organon*, and like it originally meant an instrument of any kind; afterwards it came to signify a musical instrument, and still later was restricted to the grandest of wind instruments. In the Old Testament the word O. is used in the sense of pandean-pipes (the Greek *syrix*, and Hebrew *ugab*), and that instrument combined with a wind-chest, as seen in the bagpipes, is believed to have been the precursor of the O. The invention of the O. is ascribed to Ctesibius about 200 B.C. Early organs were blown by the fall of water, hence the name *Hydraulic O.* Nothing certain is known regarding the use of the O. in Europe before the 8th c., when the church of St. Cornille at Compiègne was provided with one. Organs were common in England in the 10th c. They were, however, rude in construction, with a small compass of harsh notes. Pedals or foot-keys were devised by Bernardo at Venice in 1470, and gradually other improvements were effected, till at the close of the 16th c. the principal features of the O. differed little from those of the most modern instrument.

The most majestic development of the O. is found in a large instrument, such as used in churches, which is composed of several small organs, differing in quality of tone, and each having its separate wind-chest, sound-board, and distinct row of keys. The parts which make up a large church O. are called the great O., choir O., swell O., solo O., and pedal O. 'Horizontal' bellows supply the air-tight chambers, termed *wind-chests*, with compressed air through wooden pipes named *wind-trunks*. Over the wind-chest, *a a* (see Fig.) is the sound-board *s b*, which contains parallel air passages, *g g g*. These air passages or *grooves* convey through holes in their upper side compressed air to the pipes, *p p p*, arranged in rows above. The valves or *pallets*, *c c c*, are pressed tightly by springs against the openings from the wind-chest into the grooves, but are drawn down by pressure upon the keys with which they are connected. On the upper side of the sound-board, and at right angles to the grooves, channels are formed, and in every one a strip of wood *e* slides backwards and forwards. Each *slider* is

perforated with holes corresponding to those in the sound-board, and unless the two sets of holes are directly over each other the pipes above cannot

that groove must necessarily belong to one note. The rows of keys are called the *keyboards* or *claviers*, and according as the hands and feet are used in playing them they are termed *manuals* or *pedals*.

O. pipes are differently disposed over the sound-board. A common arrangement is to place the largest on the outside and the smallest towards the centre. The pipes are made of pewter, technically 'metal,' or of wood, as deal, pine, and cedar, and there are two distinct kinds—*flue-pipes* and *reed-pipes*. Metal flue-pipes are cylindrical in the body, and terminate at the foot in an inverted cone; wooden flue-pipes are four-sided in the body, and stand on a narrow tubc. The tone of a flue-pipe is produced by the vibration of the column of air in the body of the pipe.

The annexed cut shows the sectional arrangement for producing sound in a wooden flue-pipe. The air is admitted by the foot *f*, and passes through the *wind-way* between the block *b* and the cap *c*, and in escaping impinges forcibly upon the sharp edge or lip *l*, the air in the body is thereby set in vibration, resulting in a musical note. In metal flue-pipes a plate of metal called the *language* takes the place of the block, and by slightly indenting the pipe over and under the mouth to form lips, a thin stream of air is directed against the upper lip and causes the resonance of the enclosed air as before. On the length of the body depends the pitch of the note, the longest pipes producing the gravest notes. Flue-pipes are either open or closed at the top, and a closed pipe speaks an octave lower than an open one of the same length.

Reed-pipes differ from flue-pipes in construction, and the sound emitted by them results from the vibration of a metallic tongue, whose length and thickness determine the pitch. The quality of the note is influenced by the form of the tube above. The *reed*, from which the pipes take their name, is a cylindrical or slightly conical brass tube, closed at the bottom, having a longitudinal slit covered by a strip of the same metal, called the *tongue*. The tongue is firmly held against the reed at the top, but is free at its lower end. A solid block of metal is fixed in the *boot* of the pipe, and through it the open end of the reed passes into a tube either of metal or wood. The air, entering by the boot of the pipe, passes through the reed, and causes the tongue to beat against the walls of the opening, with the production of a musical note. A bent piece of wire, passed through the block in front of the tube, presses against the tongue; by raising or depressing the wire, more or less of the tongue is allowed to vibrate, and the note is grave or acute accordingly. In the *free reed* of M. Grenié, the tongue oscillates freely within the longitudinal opening; it is much used in Continental organs.

The usual compass of a large O. is $4\frac{1}{2}$ octaves on the manual claviers, beginning from C (8-foot stop), and $2\frac{1}{2}$ octaves on the pedal clavier.

Several modern improvements on the O. are noteworthy. The *pneumatic lever* of Mr. Barker is an ingenious contrivance for lessening the fatigue of the performer in pressing down the keys. It is a little bellows, and acts by depressing the wires which open the valves. *Couplers* are employed to secure at pleasure the combined action of different sets of keys, and *composition-pedals*, worked by the feet, effect the movement of certain combinations of the sliders, without removing the hands from the keyboard. Manual labour for the supply of wind from the

bellows has been dispensed with by the recent introduction of gas and hydraulic engines adapted to the end in view. Electricity has also been utilised in playing the O. In the *Electric O.* each key of the keyboards, which may be at any distance from the pipes, is connected with its pallet by an insulated wire, and on depressing a key electro-magnetic action is induced which draws down the pallet. The Royal Albert Hall in London possesses one of the largest and most powerful organs in the world. It has 111 stops, and 9000 pipes, ranging from 40 feet in length (30 ins. diameter) to the size of a small key. Of five claviers, four manuals have a compass from C C to C in altissimo, and a pedal extends from C C C to G. The entire O. is 70 feet high and 60 feet wide. See Rimbault & Hopkins, *The O., its History and Construction*; and *The O.*, by Dr. Stainer (series of Music Primers by Messrs. Novello, Ewer, & Co., Lond. 1878).

Organic Analysis is chemical manipulation which aims at determining the composition and constitution of organic compounds. A complex organic compound is ordinarily made up of several distinct simpler compounds; and these are first determined by what is known as *proximate* analysis. This is effected in various ways by mechanical disintegration, by the action of solvents (water, alcohol, ether, &c.), by precipitation, distillation, and crystallisation. The next step is to determine the composition, qualitative and quantitative of the proximate constituents; and the processes necessary to effect this form what is called *ultimate* organic analysis. The ultimate constituents of organic compounds are, as a rule, carbon, hydrogen, oxygen, and nitrogen. Carbon and hydrogen are detected by burning the compound in the presence of an oxidising agent, such as oxide of copper. The hydrogen combines with oxygen to form water; and the carbon to form carbonic acid, which is readily recognised by its action upon solution of baryta, resulting in the formation of the white precipitate of the carbonate of baryta. Heated with excess of caustic potash, a nitrogenous substance yields ammonia. Should sulphur, phosphorus, or arsenic be present, they can be detected by igniting the substance with caustic potash and nitre, when the corresponding acids result. Having thus determined what elements enter into the composition of the compound, the next step is to find the percentage quantities present. The first attempts at quantitative analysis were made by Gay-Lussac and Thenard; and their processes have been modified and improved by subsequent chemists. Liebig especially has introduced many simplifications, and has done more than any other to raise analysis to the high position it now holds. An accurately weighed quantity of the compound to be analysed is intimately mixed with oxide of copper or other strongly oxidising agent in excess. The mixture is placed in a combustion tube of hard German glass, which is connected with potash bulbs through a U-tube containing chloride of calcium. As the compound is heated, the carbon and hydrogen are driven off and become oxidised. The resulting water is absorbed by the chloride of calcium; and its quantity is measured by the increase in weight of the U-tube. The carbonic acid combines with the potash to form the carbonate, and its quantity is obtained similarly. The process is continued till no more gas passes over; the different portions of the apparatus are then weighed, and the quantities of carbon and hydrogen obtained. Should the compound only contain carbon, hydrogen, and oxygen, the quantity of oxygen is found by subtracting the sum of the quantities of the carbon and hydrogen from the whole quantity of the substance. The development of accurate methods of quantitative analysis has, by making chemistry an exact science, led to the great progress of recent years—a progress most marked among organic substances.

Organic Chemistry, in its original signification, was that branch of chemistry which treated of substances derived from vegetable and animal matter. This definition is now, however, unsatisfactory, since many of the compounds are derived from other sources than organic tissues, and can be formed synthetically by the chemist. At present O. C. is conveniently defined as the 'chemistry of the carbon compounds.' As a general rule organic compounds are composed of hydrogen, oxygen, nitrogen, and carbon, combined in various proportions. A large and most important group of compounds is the hydro-carbon group (see HYDRO-CARBONS), each member of which contains carbon united with hydrogen and oxygen in the same proportion as water. It

embraces the sugars, starch, gum, inulin, cellulose, which are described under their respective headings. The fermentation of these in presence of organic matters results in the formation of alcohols, and introduces us to a wide field of chemical research, embracing the alcohols, aldehyds, ethers, and their derivatives. It is impossible here to do more than refer to the other important groups of compounds—such as the fats and oils, the soaps, the organic acids, succinic, malic, tartaric, citric, benzoic, &c., and the interesting series of cyanogen compounds. The compounds of ammonia, and the closely-allied subject of organic bases, also merit notice. These organic bases are combinations of molecules which enter into the constitution of salts exactly like hydrated bases or metallic oxides. They are also known as alkaloids, are soluble in water, and have an alkaline reaction. Many poisons and drugs, nux vomica, strychnia, atropia, nicotine, conia, &c., owe their action to the alkaloids contained in them. Chemically, these organic bases may be considered as ammonia, in which the hydrogen has been wholly or partially replaced by organic radicals. Trimethylamine, a base occurring in herring brine, is an example, and has a formula $N(CH_3)_3$.

Organic Radicals are combinations of several elements, which in organic compounds play the same part as the simple elements in inorganic compounds. The non-metallic elements, chlorine, bromine, sulphur, &c., have their organic representatives in cyanogen, acetyl, formyl, &c.; while hydrogen and the metals have theirs in ethyl, methyl, amyl, phenyl, &c. Certain of these O. R. have been obtained in a separate state, but the majority only exist in their compounds. A single example of the manner in which their compounds are formed will suffice. The compounds of potassium may be compared with those of ethyl, which has the composition C_2H_5 . K_2O corresponds to $(C_2H_5)_2O$ or ether; KOH to C_2H_5OH or alcohol; $KHSO_4$ to $C_2H_5HSO_4$ or sulphuric acid.

Organic Structure and Organised Bodies. See ORGANISATION.

Organic Substances, in Chemistry, were originally those compounds which are obtained from vegetable or animal matter, and upon which the physical operations of life depend. Now, however, this definition is too limited; and indeed it is impossible to draw a distinct line of demarcation between organic and inorganic chemistry. Nevertheless it may be accepted as a general rule that organic substances are for the most part composed of hydrogen, oxygen, nitrogen, and carbon, combined in various proportions. Many of these substances, at first only obtainable from vegetable or animal matter, can now be formed synthetically by the chemist.

Organisation, a name given to the peculiarity of structure in animals and plants in virtue of which living beings have a number of *organs* or *parts* related to each other in *structure* or *functions*. The possession of such parts constitutes what is known as O. It is the possession of dissimilar structures or parts which sharply distinguishes *organic* or living from *inorganic* or lifeless bodies. Dissimilarity or heterogeneity in structure is as striking a characteristic of organic bodies as similarity of particles or *homogeneity* is of inorganic things. The possession of life and the play of vital acts relates the different organs of a living body in their working, and evolves a harmonious whole out of the dissimilar materials of which the organised being consists.

In the earlier definitions which were framed regarding the nature of 'life,' that mysterious force was said to be dependent on the presence of O. That this mechanical method of determining what are living beings is erroneous, may be seen if we consider that there are many organisms which live perfectly as regards themselves, and which nevertheless do not show the slightest traces of O. An *Amoeba* (q. v.) or a *Foraminifer* (q. v.) are simply specks of protoplasm devoid of all structure or O., yet each not only lives, but the latter even manufactures an elaborate shell. Thus O. is the *result* and not the *cause* of life. Animals and plants live, not because they are organised; they are organised because they live.

Organism, the term used to denote the collective structure which belongs to a living being. Any animal or plant of whatever rank, and whether of simple or compound nature is an O. See ORGANISATION.

Organista, a genus of insectivorous birds of small size, inhabiting South America, and represented amongst others by the *Troglodytes leucophrys*, a Peruvian O. These birds derive their popular name from the clear musical nature of their song-notes.

Organometallic Bodies, in Chemistry, are an interesting group of substances, in which an organic radical is directly united with a metal without the intervention of oxygen. Organic salts, with metallic oxides as bases, such as the metallic acetates, are therefore not included. The members of the series are moulded on the type of the chlorides—the organic radical replacing the chlorine. The corresponding formulae of the two series, the organic and the inorganic, are exactly similar—one molecule of such radicals as ethyl, methyl, amyl, &c., replacing each atom of chlorine in the chlorides of potassium, sodium, tin, zinc, magnesium, &c. The characteristic property of many of these remarkable substances, especially when the metal is highly electro-positive, is their powerful attraction for oxygen—so powerful in certain cases as to result in spontaneous combustion.

Organ Points or Pedal Points. In some passages of music for the organ, frequently towards the end of fugues, the tonic or dominant is sustained through various changing of harmony, constituting a pedal bass. The parts proceed quite independently of the pedal sustained note, the changes being taken on the manuals.

Organ Positive, a small organ without pedals.

Organzine, a variety of thrown silk. Reel threads of silk twisted are called *singles*, and two or more of these singles twisted together in a contrary direction constitute O.

Orgeat (Fr. from *orge*, Lat. *hordeum*, 'barley'), a pleasant beverage made from barley-water and blanched sweet almonds, sweetened with sugar and flavoured with orange-flower water. It is commonly sold in the restaurants of Belgium and France.

Orgies (Gr. *orgiai*, probably from the same root as *ergon*, 'work') were, among the Greeks, sacrifices accompanied by certain secret rites, as in the worship of Demeter at Eleusis, of Dionysus, and of the Cabiri. These were often marked by drunken revelry, for which the modern word 'orgy' has become a synonym.

Orgues (Fr., from Lat. *organum*, in Suetonius, 'a machine'), in military art, long pieces of timber, pointed and shod with iron, suspended over a gateway ready to descend to close it. In the 15th and 16th centuries a machine—the precursor of the modern *mitrailleuse*—composed of a large number of guns bound together, which could be fired simultaneously or one by one, was termed an O.

Oriel (Low Lat. *orielum*, variously regarded as a diminutive of *os*, 'a mouth,' or *area*), in architecture, denotes a projection from or recess within a building, as a penthouse, minstrel's gallery, closet, bower, &c. The modern term 'O. window' corresponds to the Bay Window (q. v.) of ancient writers, and Scott is therefore wrong in applying it to the east window of Melrose Abbey.

Oriel College, Oxford, was founded in 1326 by Edward II., at the suggestion of his almoner, Adam de Brome, for a provost and ten fellows. By 17 and 18 Vict. c. 81, the present foundation consists of a provost, 17 fellows (including the Regius Professor of modern history), 10 scholars, 18 exhibitors, and 2 Bible clerks. The 10 scholarships, and 4 of the exhibitions (called the Exhibitions of Adam de Brome) are tenable for five years, and are of an annual value of £80. O. C. presents to fourteen livings, and in 1876 had 227 members of convocation, 83 undergraduates, and 434 members on the books.

Oriental Alabaster. See ONYX MARBLE.

Orientalion, in Archaeology, the eastward position of the chancel end of a church, so that the worshippers might face the quarter whence they looked for the second advent of Christ.

Ori flame (from Lat. *aurea flamma*, 'a flame of gold'), the great national standard of France, only unfurled on important occasions. It was the banner of the abbey of St. Denis, under

the protection of the Counts of Vexin. When the lands of Vexin were annexed to the Crown by Philip I. the banner changed hands also. Some say it was lost at Agincourt, others that it last appeared on the battle-field in the reign of Charles VII.

Origen, the greatest of the Alexandrian divines, was born in 185 A.D. He received an excellent education, first under his father Leonidas, a learned and pious man, who suffered martyrdom when O. was seventeen years of age (202), and then under Clement of Alexandria, the head of the Catechetical school, and the pagan philosopher Ammonius Saccas. Such were his learning, piety, and industry, that at the age of eighteen he was appointed by the Patriarch Demetrius successor to Clement, in which office he earned a great reputation. Owing to the persecution under Caracalla, he paid a visit to Cæsarea (215), where he was received with great distinction. On a subsequent visit to Cæsarea (228), he was ordained a presbyter by the bishops of Cæsarea and Jerusalem. This seems to have given offence to the Patriarch of Alexandria, who in 230 summoned two councils on the subject, the first of which banished O. from Alexandria, and the second deposed him (232) from his sacred office. O. now retired to Cæsarea, where he continued to fill the office of presbyter, giving public instruction, and writing expositions of the Scriptures. He was twice invited to councils held in Arabia against heretics, both of whom (Beryllus of Bostra, 244, Arabic, 248) he convicted of their errors. O. escaped from the persecution of Maximin the Thracian by fleeing to Cæsarea in Cappadocia, but in the Decian persecution he suffered so much ill-usage in Tyre that he died there soon after (254). The writings of O. were very numerous, the principal being expositions of Scripture, which were the model and source for all succeeding Greek commentators, but most of which are unfortunately lost. They were in the threefold form of Homilies, or popular lectures, Commentaries, and *Scholia*, or short notes, specially intended for the learned. He wrote also eight books against Celsus in defence of Christianity, still extant; four on First Principles, only extant in a Latin translation; a Hexapla (q. v.) and Tetrapla, or editions of the Old Testament, on which he laboured for twenty-eight years, but of which only fragments remain; ten books, entitled Stromata, which are lost, besides epistles, tracts, &c. In the field of Biblical criticism the chief merit of O. lay in reforming the Alexandrian system of interpretation, which was the allegorical pushed to extreme, by introducing a more accurate distinction between the *literal*, the *moral*, and the *mystical* sense. When O. was deposed by the Council of Alexandria, he was charged with heretical opinions, as well as uncanonical conduct, and his heretical opinions were afterwards refuted by Jerome and Epiphanius. But his writings were so much corrupted, and so many of them are lost, that it is difficult to tell how far the opinions fathered upon him were actually his. The following are the chief of the peculiar tenets which may with probability be ascribed to him, as being principles of the Alexandrian philosophy generally:—(1) The present world is only one of an infinite series, extending both before and after it. (2) It was created to be the dwelling-place of fallen intellectual beings (angels, stars, men, and demons), who were all created alike in a former state of existence, and may all regain their lost estate; the punishment of the condemned, even of Satan himself, not being eternal. (3) The Logos, as a ray of the Divine glory, was begotten from all eternity, but the Holy Ghost, like all other things, was created by the Son. (4) Souls at the Resurrection would not resume the gross, material body, but one of fine, incorruptible texture. The best edition of O.'s works is that by Lommatsch (25 vols. Berl. 1831-48). See Redepenning's *Origenes: Eine Darstellung seines Lebens und seiner Lehre* (Bonn, 1841), Gieseler's *Lehrb. der Kirchengesch.* (Eng. trans. 1855), Davidson's *Sacred Hermeneutics* (Edin. 1843). There is an English translation of O. in the *Ante-Nicene Library* (2 vols. Edin. 1870).

Original Sin is sometimes understood to mean, or it is made to include, all the subjective evil consequences of the Fall (q. v.), namely, 'the guilt of Adam's first sin,' 'the loss of original righteousness,' and 'the corruption of our whole nature.' But properly by O. S. is meant the third of these particulars only, namely, 'the inherent corruption in which all men since the Fall are born,' which is called O. S. by theologians because (1) 'it is truly of the nature of sin,' (2) 'it flows from our first parents as the origin of our race,' (3) 'it is the origin of all other sins,' and

(4) 'it is in its nature distinct from actual sins.' The conceptions and definitions of the nature of Sin (q. v.) which prevailed in the primitive Church were very indefinite. According to the dualistic theory of many of the heretical sects, sin was regarded as a necessary consequence of contact with evil matter. Orthodox theologians, on the other hand, regarded it as a voluntary disobedience of God, and in relation to the Fall the sinful acts of every individual appeared to them rather a voluntary repetition of the first sin than a necessary consequence of it. Man stood in the same relation to the tempter that Adam did before the Fall. The first to use the phrase O. S. was Tertullian (q. v.), who taught that 'the soul propagates itself, with all its defects and faults, as matter is propagated.' According to Origen (q. v.) the soul was stained with sin in a former state, and thus enters the world in a sinful condition, while physical generation is in itself a sinful act (an idea which belongs to dualism). It was in the controversy with Pelagius (q. v.), however, in the 5th c., that the doctrine of O. S. was first strictly defined by Augustine (q. v.). According to the former, every human being is a moral agent, complete in himself, and separate from all others, and hence there could be no other connection between the sin of Adam and the sin of his posterity than a voluntary imitation of a bad example. In opposition to this, Augustine laid down the doctrine that 'as all men have sinned in Adam, they are justly exposed to the vengeance of God, because of this hereditary sin and guilt of sin.' In later times, the theologians of the Eastern Church generally, while admitting a deterioration of the moral power of man, retained the earlier notions regarding the freedom of his will. In the Western Church, almost all the Schoolmen (q. v.) followed Augustine, although with various modifications of his doctrine. The Mystics (q. v.) in general spoke of the entire depravity of 'the old man,' and the evangelical theologians regarded all as corrupted by O. S., while making a difference between accountability for it and for actual transgressions. After the Reformation, the doctrine as developed among the Protestants was strictly Augustinian: 'The Fall of man was an act by which his inmost nature was corrupted, his original righteousness changed into absolute depravity, and whose consequences have so affected his descendants as to expose them, in their natural condition, to the Divine wrath, and to unfit them for the free performance of anything that is truly good.' According to the Roman Catholic theology 'the Fall caused only the loss of the Divine gifts, the natural consequence of which is man's imperfection and infirmity.' The doctrine of the Arminians (q. v.) was, (1) That the corruption of nature which all men derive from Adam is not of the nature of sin; and (2) 'That man by the Fall has not lost his ability for good.' The doctrine of the Socinians (q. v.) was as nearly as possible Semi-Pelagianism (q. v.). See Hodge's *Systematic Theology* (Edinb. 1873), Ilgenbach's *Lehrbuch d. Dogmengeschichte* (Eng. trans. 1847).

Orihueña, a town of Spain, province of Alicante, 16 miles N. of Murcia, on the Segura, which is here crossed by two bridges. The town, which is surrounded by a fine huerta containing palm, orange, citron, almond, pomegranate; and mulberry trees, has a cathedral, four churches, twelve monasteries, three libraries, and a theatre. The people cultivate fruit and silkworms, and also the manufacture of hats, soap, and saltpetre. A great fair is held annually on the 6th of August. O., the Roman *Orcelis*, named by the Goths *Auriola*, came into the hands of the Arabs in 712, from whom it was taken in 1264 by Jago I. of Aragon. Pop. 16,478.

Orino'co, a river of S. America, almost entirely within Venezuela, rises in the Sierra Parime, on the N. frontier of Brazil, in lat. 3° 40' N. It bifurcates 150 miles from its source, sending the Casiquiare S.S.W. to the Rio Negro, and its main stream in a great curve first N.W., then N., and finally W. to the Atlantic, which it enters at the western extremity of British Guiana, and by one large and many smaller channels, forming a delta 180 miles wide. It is said to receive the waters of nearly 2000 streams; of these, the most important from the W. are the Guaviari, Meta, Apure, &c., from the E. the Caroni and Caura. The total length of the river is 1960 miles, but it is navigable only to the Apure (q. v.), a distance of 777 miles. It drains an area of 650,000 sq. miles. Above this point it is interrupted by cataracts, those of Atures and Maypures being celebrated for their romantic beauty. In its upper course the O. drains on the E. a richly-wooded highland region, and on the W. the wide

expanse of llanos stretching towards the Columbian Andes. At Bolivar, 250 miles from its mouth, the river is 390 feet deep and 4 miles wide.

Oriole (Fr. 'golden yellow'), the name given to very different kinds of *Inessorial* birds. The genus *Oriolus*, to which belong the Golden O. (*O. galbula*), the Mango bird of India (*O. kundoo*) and the black-headed Bengal O. (*O. melanocephalus*), is included in the Dentiostiral section of the Inessores. In this genus the nostrils are oval-shaped, and the tail is rounded and of moderate size. The third and fourth quills are the longest. The golden O. inhabits the S. of Europe. It is common in Italy, attains a length of 10 inches, and is of a bright yellow colour (hence its name), with black on the wings. It subsists on insects. Another group of birds so named is included among the *Conirostral* Inessores, and in

Orioles' Nests.

the family of the *Icterina*, or 'Hang-nests.' The orchard O., or 'Bob-o'-Link' (*Xanthornis varius*), occurs in America. It does good service by destroying large quantities of caterpillars in spring. The male is black above, and has brown tints below; the female is of a yellowish-olive above. The average length is 6 inches. The Baltimore O. (*Yphantis Baltimore*) extends throughout N. America, and is also found in Brazil. The nest is pendulous and purse-like. A deep black colour prevails in the upper parts of this bird, while the under parts are a bright orange. — The crested O. (*Cacicus cristatus*) of tropical America is a third species, brown in colour, and having a crest on the head.

Ori'on, a mighty Boeotian hunter, the son of Hyrieus or Poseidon, according to the Greek myth, was so tall that he overtopped the clouds, and could wade through the deepest seas. For violence done to Aëro, a Chian maiden, he was blinded by her father CEnopion, but regained his eyesight by journeying eastward, so as to meet the rays of the rising sun. After his death, which was variously ascribed to the sting of a scorpion and the arrows of Artemis, O. was placed among the stars (Hom. *Iliad*, xviii. 486).

Ori'on, one of the most brilliant of constellations. It lies in the southern hemisphere, but is visible in northern latitudes during the winter months as a striking object above the southern horizon. Of its seven principal stars, two (Rigel and Betelgeuse) are of the first magnitude, and three of the others lie in a straight line forming the so-called belt. A little below the belt, forming part of the sword-sheath, is an irresolvable nebula, one of the few visible to the naked eye, and one of the most fantastic in shape. See **NEBULA**.

Orissa, a province of Bengal, British India, running down S. almost from the mouth of the Hooghly river to the Ganjam district of Madras, and lying between the Bay of Bengal and the plateau of Central India. Area (including tributary states) 23,901 sq. miles; pop. (1872) 4,317,999. It consists of a fertile alluvial plain, bordering the sea, which may be regarded as the delta of three rivers, the Mahanuddy, the Brahminy, and the Byturni; and of a hilly tract inland, the home of aboriginal tribes, and still ruled by semi-independent rajahs, of whom those of Morbhunj, Keonjhar, and Dhenkanul are the principal. It is divided into the three districts of Cuttack, containing the capital city of the same name, Puri, with the town and temple of Juggernaut, and Balasore. The staple, and indeed only, crop is rice; the complete failure of which caused the terrible famine of 1865-66, by which one-fourth of the total population is known to have been swept away. Canals both for irrigation and navigation have now been constructed (see **ORISSA CANALS**), and the ports on the sea-board have also been greatly improved. In 1875-76 the imports amounted to £347,000; the exports, chiefly rice, to £327,000. The harbours are False Point and Chandbally. There is also a brisk trade by land with Madras and Bengal. The manufactures are insignificant, excepting salt. Another valuable product is building-stone. The inhabitants, called Ooriyas, use a peculiar dialect derived from

the Sanskrit, which is cognate to Bengali and Hindi. They emigrate to Calcutta as palanquin-bearers, domestic servants, and gardeners. In 1875-76 the total revenue was £319,000, of which one-half came from land and one-third from salt. The land settlement differs from that of Bengal, in being fixed for terms of thirty years instead of permanent; the rights of the cultivators also are better secured.

The province has always enjoyed an isolated history of its own. At the commencement of the Christian era it was a Buddhist kingdom; and the Buddhist caves and sculptures in O. are thought to be the earliest monuments of that religion in India. Then followed two dynasties of Hindus, successively worshippers of Siva and Vishnu, the latter of which founded and endowed the world-renowned temple of Juggernaut (q. v.). In those days the limits of the province were extended N. to the Hooghly, and S. to the Godavery River. In 1559 occurred the Mohammedan conquest; but the descendant of the last Hindu king is still titular Rajah of Koordah, and hereditary sweeper to Vishnu or Juggernaut. The Mahratta marauders obtained possession in 1751, and order was not restored till 1803, when it was conquered by the British in pursuance of the general scheme by which the Mahratta power throughout the peninsula was overthrown by the Marquis of Wellesley. See *Orissa*, by Dr. W. W. Hunter (2 vols. 1872), and Rajendralala Mitra's *Antiquities of O.*, vol. i., published under the order of the Government of India (Calcutta and London, 1875).

Orissa Canals. The husbanding and distribution of the water-supply of Orissa (q. v.) was first commenced in 1862 by the East Indian Irrigation Company. In 1868, after the great famine, the uncompleted works were taken over by Government. The main canals are four in number, and are intended both for navigation and for the irrigation of one and a half million acres. Up to March 1876 a total of £1,657,566 had been expended on capital account. The returns in that year were only £4549, and the aggregate deficit, inclusive of interest, was nearly half a million sterling. The truth is that the cultivators of Orissa are content with the local rainfall in nineteen years out of twenty, and refuse to take and pay for the canal water which they do not want.

Orista'no, a town of Italy, island of Sardinia, in the province of Cagliari, in a fertile plain ('Campidano') on the river Tirso, 3 miles from the Gulf of O., and 61 N.N.W. of Cagliari by rail. It is the seat of an archbishop, and has several churches and monasteries, and a cathedral of the 17th c. with a great belfry. O. carries on maritime trade and tunny fishing, and manufactures earthen vessels for water, wine, and oil, and vases in imitation of the old Etruscan. Pop. (1874) 6996.

Oriza'ba, a town of Mexico, in the state of Vera Cruz, lies in a fertile valley S.E. of the volcano of the same name, 70 miles from the seaport of Vera Cruz by rail. The climate is moist, but not unhealthy. The people are chiefly engaged in cotton and flax spinning, and carry on a considerable trade with Vera Cruz. Round the town are plantations of sugar-cane, tobacco, rice, and coffee. Pop. 37,695.

The volcano of O. also called Pic de O., and volcano of San Andres (Mex. Citlaltepētli), is in height and form the grandest mountain in N. America. It reaches (according to Ferrer) an elevation of 17,780 feet above the level of the sea, and was ascended for the first time in 1848 by two American officers, Reynolds and Maynard. The last eruption commenced in 1545, and continued more or less till 1566. The slopes of the mountain are now clothed with forests of fir and oak, and no trace is visible of its former devastations. The snow line is 14,004 feet, the highest pass 14,416 feet, and the limit of tree growth 11,401 feet. The highest inhabited place, Rancho Jacale, is 10,000 feet above the sea.

Orkney Islands (Old Norse, *Orkn-eyjar*, 'seal islands'), a group of sixty-seven islands (only twenty-nine of which are inhabited), lying N.N.E. of the county of Caithness, from which it is separated by the Pentland Firth (6 to 12 miles wide), and together with the Shetland Islands (q. v.) forming one county, represented in Parliament by one member. Area, 610 sq. miles; pop. (1871) 31,274. The chief islands, Pomona or Mainland (the largest), Hoy, South Ronaldshay, Roway, Shapinsay, Stronsay, Westray, Papa Westray, Eday, Sanday, and North Ronaldshay, are of irregular form and much indented. The surface is generally level and low. Much consists of rock or

waste, especially in the W., where the hills culminate in the Ward of Hoy, 1555 feet high. The formations are Old Red Sandstone, interspersed with basalt, and overlaid in many places with boulder-clay containing striated pebbles. Glacial markings abound. In the sandstone fossil fish, and in the peat-mosses carbonised fossils, have been found in great quantity. The soil is chiefly clay and sand, intermixed with peat and shell-marl. There is little wood, and till recent times agriculture was much neglected. In 1876 there were in O. I. 35,801 acres in oats and barley, 16,301 in green crops, 24,018 in grasses under rotation, 19,146 permanent pasture, and 1014 bare fallow or uncropped arable land. In the same year the horses numbered 5697, cattle 26,156, sheep 30,048, and pigs 4687. In 1877-78 the valued rent was £62,979. The climate, generally moist, is mild for that latitude, but in winter severe storms are frequent. The mean annual temperature is about 46° F., and the rainfall from 28 to 37 inches. Herring, cod, and lobster fishing, rabbiting, fowling, distilling, the manufacture of straw-plait, and the rearing of poultry are the chief occupations of the people. 100,000 lobsters are shipped to London every year, and 20,000 gallons of spirits are annually produced at Kirkwall (q. v.), the county town, at whose port there entered in 1876, 1589 vessels of 114,142 tons, and cleared 1547 of 112,441 tons. Stromness, on the S.W. coast of Mainland, 12 miles from Kirkwall, is a sub-port to the latter. Between these towns are the prehistoric 'standing stones of Stennis,' Cromlechs, tumuli, and 'Picts' houses' are found in various parts of Orkney. The original inhabitants belonged to the Britanno-Celtic family; but as early as the 8th c. the Northmen (q. v.) began to settle there, and gradually the Celtic population was effaced, and a purely Scandinavian race took its place. Soon after his accession, Harald Haarfager (q. v.) subdued the Vikings who had settled there, and from 875, when Einar, son of Ragnvald, Jarl of Mōri, was made Jarl of Orkney, both the Orkney and Shetland Isles owed allegiance to the king of Norway. Christianity was introduced in the 11th c., and soon afterwards, on the conquest of Caithness and Sutherland by the Jarl of Orkney, Malcolm II. of Scotland recognised his authority. In 1355, Orkney passed by the female line to the house of Sinclair, who transferred their allegiance to the king of Scotland, and it was finally handed over to James III. in 1469 as the dowry of his bride, Margrete, daughter of Christiern I. of Norway and Denmark. Ever since Orkney has been subject to the Scottish crown there has been a Lowland-Scotch or Germanic admixture in the population, and the language is now everywhere English, yet in form and features the Orcadians distinctly retain the traces of their Scandinavian origin.

Orle (Fr., from Lat. *orula*, a diminutive of *ora*, 'an edge'), in Heraldry, a subsidiary, composed of a double line, at about a fifth part from the edge of the shield. It looks like a narrow border of a small shield charged upon the field of a larger one, and is sometimes called an 'inescutcheon voided.'

Orléans, a town of France, capital of the department of Loiret, lies in a richly cultivated plain on the right bank of the Loire, at the most northerly point of this stream's course, and is connected with the suburb, St. Marceau, which is situated on the other side of the river, by a bridge of 9 arches and 364 yards in length. It is about 75 miles S.W. of Paris by rail. The older part of the town has narrow streets and ancient houses, displaying fine examples in various styles of wooden architecture. The Rue Tabourg in particular preserves all the main features of a street of the 15th or 16th c. In this quarter are the houses of Jeanne d'Arc and Agnes Sorel; to the first of whom three monuments have been erected in different parts of the town. The upper part of O. is built in modern style. The finest buildings are the Cathedral of Ste. Croix (1601-1790), the churches of St. Aignan and St. Euverte, the Palace of Justice, the Prefecture, and the Hôtel-Dieu. O. has also an archaeological museum, rich in Roman antiquities, a library which includes valuable MSS., and a picture gallery containing 500 works. The principal manufactures are woollen and cotton stuffs, vinegar, oils, wax, leather, chemicals, colours, &c. Pop. (1872) 48,976. O., which existed before the Roman invasion under the name of Genabum, became under Roman rule one of the most important cities of Gaul. It owes its name *Aurelianum* (of which O. is the modern form) to the Emperor Aurelian, who greatly embellished the

town. Later, O. became the capital of a Merovingian kingdom, and was united with France under Hugo Capet. In 1428 the town was delivered from the siege of the English by Joan of Arc, hence called 'also the Maid of O.' During the late Franco-Prussian War the possession of this place and the bridge over the Loire became of great strategical importance. It was taken by the Germans under General von Tann on the 10th October 1870, reoccupied by the French on the evacuation of the Germans on the 9th November, and again taken by the Germans under the Grandduke of Mecklenburg on the 4th December, when it became the headquarters of the 2d Army Corps.

Orléans, the name borne by several branches of the Houses of Valois (q. v.) and Bourbon (q. v.). The only noteworthy members in earlier times were (1) **Louis Duc d'O.**, born in 1371, brother of Charles VI. His murder by Raoul d'Octonville, a follower of Jean sans Peur, Duke of Burgundy, in the streets of Paris (November 26, 1407), brought on the furious strife between the Armagnacs and the Burgundians, which threw France into the hands of Henry V. of England. A natural son of this Louis was the famous Jean Comte d'O., better known as the 'Bastard of O.,' and founder of the house of Dunois and Longueville.—(2) **Charles Duc d'O.**, lawful son and heir of Louis, born at Paris, 26th May 1391, became the head of the party against Burgundy and England, but was wounded and taken prisoner at the battle of Agincourt (1415), and did not regain his freedom till 1439. On his return to France he withdrew to his castle at Blois, and spent the rest of his life in the cultivation of the muse. He died 4th January 1465. The best edition of his admirable verses is that by Guichard and Champollion (Par. 1842). By his third marriage with Mary of Kleve, he had a son who mounted the throne of France as Louis XII., when the dukedom of O. reverted to the crown.—(3) The next conspicuous man who bore this title was **Gaston Jean Baptiste de France**, younger son of Henri IV., who was born on April 25, 1608, at Fontainebleau. By his marriage with the Duchess de Montpensier (1626) he became possessor of immense wealth and the Duchy of O., but it was not until he had offered the strongest objections to the plan, which was devised by his mother and Cardinal Richelieu. In 1627, his wife being dead, he wished to marry Maria of Gonzagua, and on being hindered, openly declared himself an enemy of the Cardinal. Having fled to Lorraine, he married a sister of Charles IV., declared war against Richelieu, but was driven into exile at Brussels. Thence he issued with a following of 2000 adventurers, who scoured the country as far as Languedoc; but at Castelnaudary, through his own cowardice, he received a final check, and signed a treaty engaging himself 'to respect all the King's Ministers, and particularly the Cardinal.' No sooner had he returned to the French Court than he began to plot against Richelieu's life, his intrigue only being stopped by his exile to Blois (1642). Recalled during the youth of Louis XIV. and the Spanish campaigns of 1644, 1645, and 1646, he did something to re-establish his reputation. During the war of the Fronde he played the pitiable part of a trimmer, and was ultimately sent back to Blois, where he died in confinement on 2d February 1660. See Sismondi's *Histoire des Français*, vols. xxii., xxiii., xxiv., xxv., and Kitchin's *History of France* (vols. i. and ii. 1873-77).

(4) The present house of O. springs from **Philippe I.**, brother of Louis XIV., who was born 21st September 1640, and died 9th June 1702. He was succeeded (5) by his son, **Philippe II., Duc d'O.**, who was born at Saint-Cloud, 2d August 1674, educated under the baneful influence of the Abbé Dubois, took up the profession of arms, and made his first military appearance at Mons. In January 1692 he married Mile. de Blois, a daughter of Louis XIV. by Mme. de Montespan, and in the same and following years he served at Steinkirk and Neerwinden. By the jealousy of the King he was removed from the army until 1706, when he commanded with distinction in Italy, and in 1707-8 in Spain, to the Crown of which he laid a claim, that was succeeded by some years of exile from the French Court. On the death of Louis XIV., O. became Regent of France, appointing (1715) a Regency-Council, which overthrew the terms of the late King's will. He also elaborated a scheme by which the great feudal houses should again rule the country, and began his regency by extending to religion, literature, and local estates a large measure

of new freedom. But the finances were in hopeless confusion, and O. availed himself of the services of John Law, a Scotch money-changer, who developed a vast system of paper issue, which in 1720 broke down amidst general exultation. Foreign affairs were handed over to the guidance of Dubois, and O., though a man of good ability and sound taste, devoted himself to a systematic career of debauchery. Business passed out of his hands, as his indolence and excess grew upon him, and he died at Versailles, 2d December 1723. See Kitchin's *History of France* (vol. iii. 1877).—(6) **Louis-Philippe Duc d'O.**, great-grandson of the preceding, was born at St. Cloud, April 13, 1747, educated by the Comte de Pons-Saint-Maurice, and early developed a taste in the direction of loose pleasures. In 1769 he married a daughter of the Duc de Penthièvre. Two years later he showed to what purpose he had imbibed certain theories of emancipation from America by opposing Maupeou in his arbitrary formation of a Parliament. He got a naval command (July 1778), and by his conduct in action earned the applause of the populace, though it is doubtful whether he did not behave with pusillanimity. At the Assembly of Notables (1787-88) he was chief of the Opposition, and created an O. party, and by lavish expenditure skillfully directed strengthened his hold on the people. In 1789 he was returned for the National Assembly, entered with zest into the Democratic measures adopted against the Court, and in June 1791, after the flight of the king, seemed on the point of obtaining the Crown. He was returned to the Convention (Sept. 1792), and received the name Philippe Egalité from the Commune. Fearful that the Jacobins would avenge an opposite vote, he gave his in favour of the execution of the King. It was received with the execration it deserved, and he was himself brought to the scaffold, 6th Nov. 1793, under the accusation of aspiring to royalty. See Thiers' *Histoire de la Revolution Française*, Lamartine's *Histoire des Girondins*, and Kitchin's *History of France* (vol. iii. 1877). His son Louis-Philippe was called to the throne in 1830. See LOUIS-PHILIPPE.

Orleans Cloth is a plain woven fabric consisting of a cotton warp and worsted woof. It derives its name from having originally been manufactured at Orleans.

Orleans, New. See NEW ORLEANS.

Orloff, a celebrated Russian family, whose founder, condemned to death in 1689 for his share in the insurrection of the Strelitzes, was spared by Peter the Great for his fearless bearing, and appointed an officer in the newly-formed Guard. His son, **Grigori O.**, governor of Novgorod, had five sons, of whom the second and third, **Gregori** and **Alexij**, played important parts. **Grigori**, **Prince O.**, born 1734, came to St. Petersburg during the Seven Years' War, and succeeded Poniatowski in the favour of the Grand-Princess Catharine. O. led the revolution that set Catharine on the throne in 1762, and thereafter, as her declared favourite, received great honours and possessions, being made general of the artillery, raised, with his brothers, **Ivan**, **Alexij**, **Fedor**, and **Vladimir**, to the dignity of count, and appointed by the Emperor **Joseph II.** in 1772 Prince of the German Empire. He ruled Russia unrestricted; and would have become the husband of Catharine but for the opposition of the aristocratic party under Count Panin. But at length, estranged by his proud and brutal manners, she forsook O. for **Potemkin**, and tried in vain to soothe the fallen favourite with the gift of the Marble Palace at St. Petersburg. He married suddenly, sank into insanity, and died in great suffering at Moscow, 24th April 1783. O. was thoughtless, prodigal, and vain, yet clever and courageous. By Catharine he was the founder of the Bobrinskij family.—**Alexij**, Count **O.-Tchesmenskij**, was an active officer of the Guard in the revolution of 1762, when he was the first to proclaim Catharine Empress of Russia, and is said to have strangled the deposed Peter III. Appointed commander of the Russian fleet in the Archipelago, he gained (1770) the great naval victory of **Tchesme** over the Turkish fleet, and received the surname 'Tchesmenskij.' When the Emperor **Paul** ascended the throne, he called O. to St. Petersburg from Moscow, whither he had retired after Catharine's death, but took no further vengeance on him and **Baratinski**, the only surviving murderers of his father, than to make them bear the pall at the solemn removal of Peter's corpse from the **Alexander-Nevsky Monastery**, and then to banish them from the court and from Moscow. After the Emperor's death

O. returned to Moscow, and died there in his magnificent palace, January 5, 1808. He was a man of gigantic strength, and had great courage and daring, but a harsh and imperious character.—The legitimate descendants of the O. family died out in 1826, but the name was preserved by four illegitimate sons of **Fedor**, two of whom rose to distinction. **Michael O.**, the elder of the two, born 1785, was aide-de-camp to **Alexander I.**, and concluded in 1814 the agreement for the capitulation of Paris; but, being suspected of a share in the rebellion of 1825, was banished to his estates, where he died in 1842. His brother, **Alexij O.**, born 1787, was a distinguished cavalry officer in the war with France, became thereafter aide-de-camp to the Grand-Prince **Constantine**, and in 1825 was a colonel at St. Petersburg. For his active measures in crushing the insurrection of that year, he was rewarded with the title of Count. In 1828-29 he led a cavalry division against the Turks, and concluded the Peace of **Adrianople**. O. was afterwards employed on several important missions, as in 1831 to Poland (where his presence during the death by cholera of General **Diebitch** and the Grand-Prince **Constantine** led to the suspicion of foul play), in 1832 to the Hague and London, and in 1833 to Constantinople, where he induced the Sultan to sign a treaty highly favourable to Russia. O. now became a general of cavalry, and after **Benkerdorff's** death was made Chief of the Police. In 1854 he was sent to Vienna to bring over Austria to the side of Russia. O. was a member of the Congress of Paris in 1856, and in the September of the same year he was appointed President of the Imperial Council. He died May 2, 1861. His only son, **Nikolai O.**, distinguished himself in the Crimean War, and lost an arm and eye at **Silistria**. He has since been employed as a diplomatist, first at Brussels (1860-70), then in London (1870-71), and from January 21, 1872, at Paris.—**Vladimir Davidoff**, son of a daughter of **Vladimir O.**, received permission in 1856 to take the name **O. Davidoff**. He was the leader of the opposition of the nobility to the abolition of serfdom, and in 1865 was spokesman for the nobles of Moscow who craved a free constitution.

Orlop (Dutch, *overloop*, 'over-running'), the lowest deck of a ship of the line, is situated immediately above the hold, and below the water-line, and contains the storerooms, cockpit, and magazine.

Orme, Robert, the military historian of British India, was born in Travancore, in S. India, 1728. Educated at Harrow, he returned to India as a writer in the East India Company's service in 1744. The first volume of his history was published in 1763, and he was forthwith appointed historiographer to the Company, with a salary of £400 a year. The work was completed in 1778, and covers 'the military transactions of the British nation in Indostan' from 1745 to 1763. O. died at Ealing, Middlesex, 13th January 1801, leaving a valuable collection of MS. and other historical materials to the East India Company, which have never yet been properly catalogued. His literary style was scarcely equal to his industry; but the ornate manner in which he treated an important period of history has stimulated the patriotic spirit of many other readers besides 'Colonel Newcome.' Lord Macaulay, in his well-known essays on **Clive** and **Warren Hastings**, has borrowed entire passages from him with but little modification.

Orme's Head, **Great** (Norse, *ormr*, 'a serpent'), the northernmost point of **Cernarvonshire**, in **Wales**, forms, with the **Little Orme's Head**, 4 miles to the E.S.E., part of a limestone range which varies in height from 700 to 500 feet. The former of the headlands is surmounted by a lighthouse, and between them lies the watering-place of **Llandudno**.

Or'min, **Orr'min**, or **Orm**, an author whose work, the *Ormulum*, named after himself, is one of the most valuable specimens of 'Transition English.' He was a canon regular of the order of St. Augustine, and wrote for the spiritual edification of his countrymen. His plan was to give a paraphrastic version of the Gospel for every day in the year, adding to each portion an exposition, in which, as a rule, he draws largely on **Augustine**, **Alfrie**, and **Bede**. Of this complete system of homilies we have nothing now beyond the text of the thirty-second. The metre of the *Ormulum* consists of lines of fifteen syllables pointed at the end of the eighth—one of the first English imitations of a Latin rhythm known. The handwriting, ink, and materials of the MS. (a vellum folio now in the Bodleian Library, supposed to be in O.'s own hand), lead to the supposition that it was

composed in the 13th c. The language is East Midland, with certain peculiarities of spelling, such as the doubling of consonants. Mr. Kingston Oliphant says of O.: 'He is the last of our English writers who can be said to have drunk from the undefiled Teutonic well; no later writers ever use so many prepositional compounds, and on this account we ought perhaps to fix upon an earlier year than 1200 for his date. In the course of his lengthy poem, he uses only four or five French words; his few Latin words are Church phrases known in our land long before the Norman Conquest. On the other hand, he has scores of Scandinavian words, the result of the Norse settlement in our eastern shires 300 years before his day. His book is the most thoroughly Danish poem ever written in England that has come down to us; many of the words now in our mouths are found for the first time in his pages.' Dr. White, edited the *Ormulum, with Notes and Glossary* (Oxford, 1852). See also Kingston Oliphant's *Sources of Standard English* (Lond. 1873).

Ormolu (lit. 'milled or beaten gold') is a mixture of copper and zinc closely resembling gold in colour. The colour is enhanced by dipping in dilute sulphuric acid and by the use of a 'scratch-brush.' O. is cast into ornaments for the embellishment of furniture and other articles.

Ormond, James Butler, Duke of, was born in London, 19th October 1610. An ancestry is claimed for him which dates from a Norman family older than the Conquest: what is certain is that in the 13th c. the office of cupbearer to the king was held by the family. When but a boy he lost his father and became Viscount Thurles. His grandfather, the Earl of Ormond, being imprisoned for some years, the youth was placed under the guardianship of Archbishop Abbott. In 1629 he married Lady Elizabeth Preston, and two years later he succeeded to his estates, went across to Ireland, and served with such distinction under Strafford that he received a recommendation as military successor. In 1640 he was nominated lieutenant-general, with a force of about 3000 men. With much talent and patience O. attempted to keep unity among the different sections of the old Irish Catholics, the Catholics of the English Pale, the Episcopalian Royalists, the Presbyterian Royalists of the North, but not always with success. An armistice, which he was compelled to conclude with the insurrectionists in 1643 produced some decline in his popularity, but he continued to maintain the Royal cause with consistency and vigour as Lord Lieutenant of Ireland in the king's service. After Charles had fallen into the hands of the Puritans, however, O. resigned and retired to France (1647) to meditate new schemes in behalf of his sovereign. He returned to Ireland, and by unwearied negotiations among the Papists, was able to bring together a formidable force by the beginning of 1649. On the 2d of August he was defeated near Dublin by an inferior force under Lieutenant-General Michael Jones, and again by Cromwell at Wexford and Ross. In 1650 O. went back to France, and continued to devote himself to the interests of Charles II. He was in England in 1658. 'One of these days,' writes Mr. Carlyle, 'there came a man riding jog-trot through Strafford-at-the-Bow, with "a green glazed cover over his hat," a "night-cap under it," and "his valise behind him;" a rustic-looking man, recognisable to us amid the vanished populations—who take no notice of him as he jogs along there—for the Duke of O., Charles Stuart's head man! He is fresh from Flanders and the ex-king; has arrived here to organise the Spanish Charles Stuart invasion, and see what Royalist insurrection or other domestic mischief there may be hopes of.' At the Restoration he crossed with the king, and was twice nominated Viceroy of Ireland. In 1679 an attempt was made upon his life by Colonel Blood, which led to O.'s son threatening to pistol Buckingham at the throne as the originator of the plot. O. died at Kingston Hall, Dorsetshire, 21st July 1688. His valour, talent, and sincerity won him numerous friends. See Carlyle's *Cromwell*, and Carte's *History of the Life of James Duke of O.* (3 vols. Lond. 1726).

Ormskirk, a town in Lancashire, England, and a station on the London and North-Western Railway, 42 miles S.S.W. of Lancaster. Hand-loom silk-weaving, rope-making, and the manufacture of cotton and hats are the chief industries, and in the neighbourhood of the town are large collieries. O. possesses a grammar-school, founded in 1614, and a town-hall erected in 1779. Pop. (1871) 6127.

Ormus, a barren rocky island in the Persian Gulf, 12 miles S.E. of Bandar Abbas. It is 12 miles in circumference, is formed entirely of rock-salt and sulphur, and is inhabited by some 400 persons, who are engaged in salting and fishing. The town, on the N.E. side, is defended by a fort, and was formerly a place of considerable importance. It was held by the Portuguese from 1514 till 1622, when they were driven out by the English and Persians. In recent years it has been farmed to the Imaum of Muscat, who derives a revenue from the export of salt. O. was the temporary refuge of the followers of Zoroaster, when the Mohammedan religion was propagated in Persia, and from hence they fled to Bombay, where they became known as the Parsees (q. v.).

Ormuzd (Zend, *Ahura-maz-das*, 'the spirit of the great god of light') was the principle of light, the good deity in the Zoroastrian system of religion, as Ahriman (q. v.) was the evil deity. Zoroaster (q. v.) taught that all things, good and evil, emanated from one everlasting but unmanifested deity (*Zaruana akarana*, 'the uncreated eternity'). This absolute god created from himself a dualism perpetually exhibiting the antithesis of light and darkness—O. and Ahriman; the evil principle however coming first. O. came next as a principle of light and order, to regulate the chaotic darkness and anarchy which Ahriman had produced. O. then generated from himself six other spiritual beings, called Amshaspands (Zend, *amesha-spena*, 'immortal saint'), between whom and the six Dævas or evil spirits similarly created by Ahriman there is perpetual warfare, not only in the aggregate, but each against his special opponent. It was by the creative word, however, that Zaruana created O., and by the same the latter now created the world and all material things, completing the work in a series of six periods. See ZOROASTER, ZEND AVESTA.

Orne, a department in the N.W. of France, embracing that part of Normandy formerly known as the duchy of Alençon, together with a large part of the district of Perche, which was included in the old province of Maine, is separated on the N. and E. from the English Channel by the departments of Calvados and Manche. Area, 2350 sq. miles. Pop. (1876) 392,526. The country is generally hilly, and contains large tracts of uncultivated moorland; but the river valleys are fertile, and produce good crops of oats, potatoes, hemp, flax, beetroot, and various kinds of fruit. The department takes its name from the river O., which rises here, becomes navigable at Caen, and flows into the Channel; the principal other streams being the Rille, which flows into the estuary of the Seine, the Huisne and Sarthe, affluents of the Loire. Large quantities of iron, granite, quartz, and porcelain clay are obtained, and seventeen large mineral springs exist, the most frequented of which is that of Bagnoles. Besides cattle, the chief articles of commerce produced in O. are ironwares, sugar, linen, lace, leather, and cider. Alençon is the chief town.

Ornithodelphia ('bird-wombed'), the term given to the lowest division of the Mammalia (q. v.), represented by the two genera *Ornithorhynchus* (q. v.) and *Echidna* (q. v.). In these animals there exists a striking resemblance in the disposition of the female generative organs to that which obtains in birds. Thus the two *Fallopian tubes* or *oviducts*, instead of uniting, as in higher mammalia, to form a *uterus* or *womb*, remain separate and distinct throughout. These oviducts, moreover, open separately into a *cloaca* or common cavity, which receives the *rectum* or lower extremity of the intestine, and the *ureters*. A like disposition of parts exists in birds. Other characters of the O. are found in the fact that *marsupial bones* exist, as in *Marsupialia* (q. v.). The bones of the shoulder also evince birdlike characters. The *coracoid bones* (which are mere processes of the shoulder-blade in other mammals) extend to the breast-bone, whilst a T-shaped bone (the *interclavicle*) supports the united collar-bones. The *cerebellum* or lesser brain is uncovered by the cerebrum. No tests exist on the mammary glands, which are situated posteriorly. The angle of the mandible lower jaw is not inflected, and there is no outer ear. The males have a kind of spur on the hinder feet, the use of this organ—which is perforated and connected with a gland—being unknown. The brain-hemispheres are smooth in *Ornithorhynchus* (q. v.). The O. are confined in their distribution to Australia and Tasmania. The higher divisions of the mammalia are the *Didelphia* (q. v.) and *Monodelphia* (q. v.).

Ornithology, a special branch of zoology which was formerly devoted to the investigation of the structure, classification, and habits of birds. With the rapid growth, within recent years, of zoology, and with the extension of research into all departments of natural history, 'special' departments have well-nigh disappeared. Birds are now studied as a great class of natural history objects, falling within the ordinary range of observation of the zoologist. The most famous ornithologists of past times were Belon, Willoughby, Ray, Latham, Temminck, Illiger, Swanson, Nitsch, Wilson, and Audubon. These men described chiefly the habits of birds, and noted their external appearances. Their systems of classification were almost entirely artificial—that is, were drawn from external resemblances alone. It cannot be denied that even the modern classification of birds is thoroughly artificial. The striking general likeness of the various members of the group to each other, and the difficulty of determining characters which will serve for their absolute distinction, are obstacles that hinder the construction of a true or natural system of management. See BIRDS.

Ornithorhynchus, or **Platypus**, in Natural History, a curious mammal found in Australia and Tasmania, and belonging to the family *Ornithorhynchidae*, of the order *Monotremata*. Only one species (*O. paradoxus*) is known. It measures from 18 to 20 inches in length, including the tail, and has a depressed body clothed with coarse hair, at the roots of which there is a soft, thick fur. The hair is dark-brown on the back, but ferruginous on the throat, breast, and belly. The head is small and round, with small bright eyes and internal ears, and terminates in two mandibles nearly 3 inches long, resembling the bill of a duck, and at the end of which are the nostrils. The bill is covered by a leathery membrane, and changes in form and colour after death. The mouth contains eight horny toothlike processes, and the tongue is of very peculiar shape, being furnished at the root with a kind of bulb, preventing the involuntary swallowing of food, which is directed into cheek-pouches. The legs are short, and the feet have each five toes armed with strong claws, and connected by a membrane which in the forefeet projects beyond the claws, but is drawn back when the animal burrows. On the hind-legs of the male there is a spur whose use is unknown, as it is not employed in defence. The tail is flat, broad, and in the adult *O.* clothed with hair on the upper surface only. The *O.* also possesses anatomical peculiarities approximating it to both birds and saurians. It is ovoviviparous, and usually produces at a birth two young ones, which are then very imperfectly developed. The food of the *O.* consists of aquatic insects and river shell-fish, which it procures both by diving and by dabbling in muddy places with its bill like a duck. When alarmed it growls like a puppy, and when asleep coils itself into a ball. The *O.* makes its abode in a bank near water, burrowing in a serpentine manner as much as 50 feet, and then forming a nest, which it lines with grass and dry weeds. It is crepuscular in its habits, swims rapidly, and on land runs and climbs with considerable agility. In captivity it is gentle, but delicate to rear. It has a fishy smell, probably from an oily secretion, as it takes great pride in keeping its fur clean. The flesh is eaten by the blacks, and the skin is manufactured into leather in Sydney to a small extent.

Ornithoscelida, a division of extinct *Reptilia*, proposed by Huxley to include the existing division of the *Deinosauria*, along with the curious little reptile *Compsognathus*. The latter appears to have been intermediate between birds and reptiles. It had toothed jaws, a slender neck, short fore-limbs, long and birdlike hind-limbs, and a short femur or thigh. Its remains occur in the lithographic slates of Solenhofen in Bavaria, a formation belonging to the Upper Oolitic series of rocks.

Orobanchaceæ, or **Orobanchæ**, is a natural order of Dicotyledons—all leafless brownish root-parasites—consisting of about 130 species, which are distributed through temperate and tropical countries, but are most abundant in S. Europe and E. Asia. Their properties are astringent and bitter. They ordinarily consist of a simple leafless fleshy stem, furnished with bract-like scales, and terminating in labiate flowers generally arranged in a dense spike. The seeds are very numerous and very minute. The root-stock is thick and tuberous. Each species appears to have its own special set of plants on which it feeds. Thus in the genus *Orobanchæ*, or broom-rapes, of those

occurring in Britain, *O. major* is found on furze and broom, *O. minor* is injurious to clover crops, *O. hedera* grows on ivy, *O. rubra* on thyme (or trap-rocks). The *Lathraea squamaria*, or toothwort, so called from the toothlike scales of the root-stock, found parasitic upon the roots of trees in shady places, is also a British species. See CANCER-ROOT.

Orobus can only be considered a sub-genus of *Lathyrus* (q. v.), the characters by which it differs not being of sufficient importance to constitute generic distinction. There are a considerable number of species, chiefly found in mountainous and woody districts, and dispersed over Europe and parts of Asia. The tuberous *O. (L. macrorrhizus)*, is a common plant in Britain, in woods and shady hilly ground, ascending to 2100 feet in Scotland. Its creeping root-stock forms tubers, which are (or perhaps were) sometimes eaten by the Highlanders under the name of Cormeille, and are said to repel hunger. The plant has dark-green leaves, and flowers of lurid crimson, fading to green and blue; it forms acceptable pasturage on the hill-sides. Another species, *L. niger*, found in two Scotch localities, is now nearly extinct.

Orontes (Arab. *Nahr-el-Asi*, 'rebel stream'), the principal river of Northern Syria, rises from the watershed of the Cœle-Syrian valley, about three miles N.N.E. of Baalbek, and flows in a general northerly direction through the Bahr-el-Kades—a lake 6 miles long by 2 wide—past Hems and Hamah, as far as Jisr Hadid ('the iron gates'). Here it enters the valley of Antioch, and doubling back upon itself flows S.W. towards the sea, this part of its course being compared by Stanley to the Wye. Its entire length is upwards of 200 miles. The *O.* was famed in antiquity, Juvenal using its name as equivalent to Syria (*Sat.* iii. 62).

Orosius, a historian whose fame is greater than his merit, was a presbyter of Tarragona, in Spain, in the 5th c. In 413 he went to Africa to visit Augustine, who instigated him to write his history of the world, with the object of showing that as great calamities had happened to the Roman Empire under Paganism as under Christianity. After visiting Jerome in Palestine (415), where he joined in opposing the errors of Pelagius (q. v.), he returned through Africa to his native country. The date of his death is unknown. His principal works were *Historiarum adversus Paganos Libri VII.*, and *Liber Apologeticus contra Pelagianos*, &c. The former of these, better known as the *Historia Mundi*, was a favourite historical compend of the earlier part of the middle ages, when men who desired knowledge were glad of anything that threw a light upon the darkness of the past. King Ælfred turned it into English, enriched it with additions of his own, and omitted a good deal of controversial stuff. See Mörmers *De Orosii Vita*, &c. (Berl. 1844).

Orosz-haza, a town of Hungary, county of Békés, and 31 miles N.E. of Szegedin by rail. It produces excellent wine, and has a large trade in cattle. Pop. (1869) 14,554.

Orotava, a town of the Canary Islands, near the N. coast of Tenerife, in a beautiful valley, 1027 feet above the sea. Next to Santa Cruz it is the principal town in the island, and has a pop. of 8628. Its port (pop. 3800), which is fortified, is two miles distant, and carries on some trade with Europe and America, chiefly in wine.

Orpheus, in Greek mythology, was the son of the muse Calliope by Apollo or the Thracian river-god Oëagrus. The music of his song and lyre, Apollo's gift, had power to tame wild beasts and move the very rocks and stones, and with it he aided the Argonauts (q. v.) in their famous expedition. Reft of his loved Eurydice by a serpent's bite, *O.* sought her in Hades, and there by his melody prevailed on stern Pluto and Proserpine to release their captive, but only on the condition that *O.* should not look back on her as she followed him to the upper world. He broke his pledge, and saw her, to lose her again for ever. For his opposition to the orgies of Dionysus, *O.* was torn to pieces by the Mænads; his head was cast into the Hebrus, and his lyre floated across the sea to Lesbos, whence Zeus caught it up and set it among the stars. Comparative mythologists connect *O.* with Arbhu (a Vedic epithet of Indra, 'the sun'), and Eurydice (Gr. 'far-seeing') with the dawn, which, strangled by the serpents of the night, is recovered by the sun, only to be once more slain

by the full brightness of his glory. The works attributed to O. may be divided into (1) the Orphic Theogony, a body of mystic literature preserved to us only in fragments, which belonged partly to the 6th and 5th centuries before, and partly to the first three centuries after the Christian era; and (2) certain poems, formerly believed to have been pre-Homeric, but now determined to have been composed in the last days of paganism by writers of the Alexandrian school. The latter, which include the *Argonautica*, *Hymni*, *Lithica*, &c., have been edited by Hermann (Leips. 1803). To O. was also ascribed the institution of the Orphic Mysteries, which, centring round the worship of Dionysus Zagreus, inculcated on the initiated a life of ascetic purity, and seem to have borne reference to a life after death. See Lobeck, *Aglaophamus* (2 vols. Königsb. 1829); E. Gerhard, *Ueber O. und die Orphiker* (1831); Max Müller, *Comparative Mythology in Oxford Essays* (1856); and vol. i. ch. i. of Grote's *History of Greece* (Lond. 1846).

Orpiment, a term corrupted from *auripigmentum*, or golden paint, is a native sulphide of arsenic of a brilliant lemon-yellow colour, the finest qualities of which come from Persia, although it is of not unfrequent occurrence in other localities. Artificial O. or king's yellow is a pigment prepared by subliming arsenious acid with sulphur. It is used medicinally in China, and has been employed in western countries as a depilatory.

Orrery, a mechanical arrangement for exhibiting the motions of the solar system, of the planets round the sun, and the satellites round their planets. At best, it is only a philosophical toy.

Orris Root is obtained from *Iris Florentina*, which for commercial purposes is extensively farmed about Pontassieve in Tuscany. In appearance the plant somewhat resembles the blue flag of English gardens. The roots are dug in spring, are spread to dry, then trimmed, and sorted for market. For scent purposes, the O. R. is used as a powder, and as a spirituous tincture. For the first, it is crushed between millstones, and ground in a drug-mill. The powder, mixed with six parts of dry wheat starch, forms the 'Violet Powder' of the shops. The tincture or essence is obtained by keeping for about a month the proportion of eight lbs. of the broken root in one gallon of rectified alcohol. It enters largely into the composition of all the celebrated 'bouquets.' Beads are turned from the root in Italy, and a hank of them is the possession of even the peasant girls there.

Orsini, an ancient princely family, which, as head of the Guelphic faction, played a part second only to that of the rival house of Colonna (q. v.) in the medieval history of Rome. Its members rose to be Princes of Tarento and Salerno, Dukes of Venosa, Bracciano, and Gravina, Counts of Alba, Tagliacozzo, Nola, &c., and it gave four popes to the world—Celestine III. (1191–98), Nicholas III. (1277–80), Benedict XIII. (1724–30), and Clement XII. (1758–69). The sole surviving direct branch, the O.-Gravina, is at present represented by Prince Filippo O., who, born December 10, 1842, succeeded his father, April 18, 1874. To a collateral line belonged Felice O., born at Meldola, in the province of Forlì, in 1819. While yet a student at Bologna he joined a secret revolutionary society, and in 1844 was condemned to the galleys for life, but released by the amnesty of Pius IX. (1846). On the downfall of the Roman Republic O. fled to England (1853), but returning in the following year as Mazzini's agent, was arrested and imprisoned at Mantua, whence he again escaped to London. Here he devised a plot for the assassination of the Emperor Napoleon, by throwing three 'O. bombs' beneath his carriage. This he put into practice in the Rue Lepelletier at Paris, on January 14, 1858, the result being that eight persons were killed and 156 wounded. Seized and put on his trial, O. was guillotined, March 13, 1858.

Orsova, the name of two fortresses at the 'iron gates' of the Danube. (1) Old O., or Rushava, lies in an island of the river, 92 miles S.E. of Temesvar, is a chief station in the steam navigation of the Danube, and a centre of trade between Hungary and Rumania. It belongs to Austria. Pop. 1000. (2) New O. in Servia faces it, and is also built in part on an island, and repeatedly changed hands in the Austro-Turkish wars of last century.

Orthes, a town of France, department of Pyrénées-Basses, on the Gave-de-Pau, 25 miles N.W. of Pau by rail, contains a

fine Ogival church and the ruined Tour de Moncade (once the residence of Gaston Phœbus de Foix), and has tanneries, saw-mills, bituminous springs, and a trade in salt and hams. Pop. (1872) 1737. Near O. Wellington defeated Soult, February 7, 1814.

Orthis (from Gr. *orthos*, 'straight'), a genus of extinct *Brachiopodous* Mollusca, the valves of whose shell are articulated by teeth and sockets, the hinge line being straight, and notched for the passage of a *peduncle* or fleshy stalk, by means of which the shell was attached to fixed objects. The shell is usually marked by striæ or stripes on the exterior. Species of O. are common in Silurian, Devonian, and Carboniferous strata. *O. elegantula* is a familiar Silurian genus.

Ortho'ceras (Gr. 'straight horn'), a well-known extinct genus of *Cephalopoda* (q. v.) or Cuttlefishes, belonging to the *Tetrabranchiate* or four-gilled order of that class. Their shells occur as fossils from the Silurian to the Triassic rocks inclusive. The genus forms the type of a family—*Orthoceratida*—in which the shells are straight, curved, or discoid in shape; the last or body-chamber of the shell being small. Specimens of O. have been obtained measuring 6 feet in length and over 1 foot in diameter. Upwards of 500 species are found in the Silurian deposits of Bohemia alone.

Orthodoxy (Gr. *orthos*, 'right,' and *doxa*, 'opinion') is the name given by theologians to soundness of doctrine, the standard being the doctrine acknowledged and received by the Church Catholic. Heterodoxy (Gr. *heteros*, 'another,' and *doxa*), meaning any departure from that doctrine as expressed in the creeds and confessions of the churches, is thus synonymous with Heresy (q. v.), but it is generally used in a milder sense.

Orthoepy (Gr. *orthos*, 'right,' and *epos*, 'a word'), the art of correct pronunciation, deals with the articulate sounds of a language, and teaches us to avoid such errors of articulation as *saw* for *sow*, of accent as *confer* for *confer*, of quantity as *orator*, &c.

Orthography (Gr. *orthos*, 'right,' and *graphō*, 'I write'), the art of correct spelling, in a wider sense includes punctuation, the right dividing of words, a proper use of capitals, &c. The spelling of a language when it is first reduced to writing is always, however rudely, phonetic, and only becomes traditional under the influences of time and dialectic growth. Where books are few, it can easily keep pace with changes in pronunciation, as may be seen by comparing the O. of Cicero with that of early Roman inscriptions. But, on the invention of printing and consequent multiplication of books, spelling became stereotyped, not at once, for we find Tyndale spelling the word *it* in eight different ways, but by a gradual consensus of printers, and in England by the appearance of Johnson's *Dictionary*. For a perfect O. an alphabet is requisite that is neither defective nor redundant—where one letter shall not represent two sounds (as *gun*, *gin*); or one sound have two letters to represent it (as *cow*, *kine*). The Continental languages, especially Italian, were more fortunate in these respects than English, which applied a Latin alphabet of unsettled pronunciation to a Teutonic speech. The very discrepancies, however, of English, preserve, we are told, its historic continuity and etymological character more fully than in any other modern language. To a certain extent this is true. To the philologist such words as *cough*, *enough*, tell a clearer tale than the Italian *filosofo*. But how about such words as *squirrel* (Gr. *skiouros*), *quinsy* (Gr. *kynanchē*), or *nostril* (Old Eng. *nosu-thyrel*)? We are not consistent in our discrepancies between etymology and pronunciation, because our spelling at starting was partly phonetic, partly etymological. We have *fancy* and *phantom*, *error* and *labour*, *sword*, *know* and *knight*, but not *sweðstor*, *hlāf*, or *hring*. Again, how many of the so-called etymological spellings are simply later restorations, entitled to no higher respect than the pseudo-archaisms of romance writers. *Debt*, *fruit*, and *doubt*, three centuries ago were spell *dett*, *fruite*, and *dout*. How many of these are wholly misleading, as *whole* and *wholesome* (Old Eng. *hal* and *halsum*), based on the analogy of *who*, as could on that of *should*, or *shamefaced* (Old Eng. *sceamfast*), *lanthorn* (Fr. *lanterne*), *delight* (Old Fr. *deleite*, Tyndale's *delite*), *neighbour* (Old Eng. *neah-bir*; Spenser's *neibor*), *feign* (Old Fr. *faindre*, Old Eng. *feyrer*), *island* (Old Eng. *edland*), *foreign* (Low Lat. *foraneus*), *sovereign* (Low Lat. *superanus*), *righteous* (Old Eng. *riht-wis*), &c., examples that might be multiplied almost inde-

finely. The conflict between the phonetic and historical systems is shown in the retention of *geese*, but substitution of *mice* and *lice* for *mys* and *lys*. Such are some of the features of that O. to which have been ascribed English orthodoxy and English respect for authority, and which Max Müller has denounced as a 'growing national misfortune,' Lord Lytton as 'a lying, round-about, puzzle-headed delusion,' and the late Bishop Thirlwall as 'a mass of anomalies, the growth of ignorance and chance, equally repugnant to good taste and to common sense.' Besides their æsthetic objections, opponents of proposed reforms, headed by Archbishop Trench, maintain that such reforms would involve (1) the sacrifice of all our earlier literature, (2) would confound such homonyms as *write*, *rite*, *right*, and *wright*, and (3) rest on the assumption of a chimerical uniformity of pronunciation. To the first two of these objections it may be briefly answered that no proposed system differs more from our present O. than that from Chaucer's, or Chaucer's from Cædmon's, yet that those writers are still read with delight; and, secondly, that if in speaking confusion rarely arises from the identity of sound in *wright* and *rite*, still less is this likely to be the case in reading, and that, to be consistent, these same upholders of our present O. should devise differentiated forms for the various meanings of *box* or *sole*. The third objection will be best considered under PHONETIC WRITING. See Trench, *English Past and Present* (Lond. 1855); and Max Müller, *On Spelling*, in the *Fortnightly Review* (April 1876; reprinted 1878).

Orthoptera ('straight-winged'), an order of insects, represented by locusts, grasshoppers, earwigs, crickets, &c. This group is distinguished by the fact that the front pair of wings is rendered of leathery consistence to protect the membranous hinder wings, which fold up like a fan, and which have straight *nervures* or ribs—hence the name O. The metamorphosis is incomplete, the larvæ and pupæ resembling the imago or perfect insect to a greater or less extent. The mouth-parts are free, and form powerful organs of mastication; the ravages of the locusts, &c., bearing testimony to the destructive capabilities of the masticatory apparatus. The head is large, and the ocelli are two or three in number. The compound eyes are small and widely separated. The antennæ are filiform organs, and may be very long. The two chief divisions of this order are the *Saltatorial* or *Leaping O.*, and the *Cursorial* or *Running O.*, each with legs adapted to their special modes of progression. In some O., e.g., the walking-stick insects (*Phasmida*), the wings are absent; but these are of a degraded type. Organs of hearing occur in some O. (e.g., grasshoppers and locusts). Over 5000 species of these insects are known.

Ortolan, or **Garden Bunting** (*Emberiza hortulana*), a species of *Insectorial* birds belonging to the family *Fringillidae*. The bill is small, and the nostrils are partly hidden by plumes. The second and third quills are the longest. The tail is divided, and the hinder claw is long. The O. has long been celebrated among epicures for the delicacy of its fat. It is common on the Continent, but rare in England. Large numbers are annually captured, and fed on corn and millet in the dark, until they become plump and fat. The average length is 6 inches. The O. is of a grey colour on the head, and brown on the back, the wings being black, and the chin and throat greenish-yellow. The belly is a warm brown. The nest is built on the ground, and is frequently found in corn-fields. The eggs number five or six, and are of a pale bluish-white hue, spotted with black. The O. appears to migrate northwards in summer.

Ortona (the ancient *Orton*, capital of the Frentani), a town of Italy, in the province of Chieti, on the Adriatic Sea, is built on a lofty promontory, with a small quay on the shore below. O. gives title to a bishop, and has a cathedral and several churches. It exports the excellent wine grown in the neighbourhood. Pop. (1871) 7126.

Ortyx. See VIRGINIAN QUAIL.

Oruro (in full, San Felipe de Asturias de O.), capital of the province of Oruro, in the republic of Bolivia, S. America, on a plateau 12,442 feet above the level of the sea, and 207 miles N. by W. of Chuquisaca. It has lately become the seat of the Government of Bolivia. Founded in 1590, it rose rapidly, its gold and silver mines being second only to those of Potosi, and about the end of the 17th c. it had 70,000 inhabitants, but it sank as rapidly as it had risen, when the mines had become

worked out or less profitable, and now has a pop. of 7980.—The province of O. is about 21,600 sq. miles in extent, and has a pop. of 111,000. A considerable part of the surface is occupied with swamps and lakes, the largest of which is that of Aullagas (1075 sq. miles), which receives the river Desaguadero. Though the soil is fertile, agriculture is still in a very backward state.

Orvis, a town of Italy, province of Perugia, on the summit of an isolated tufa hill, 735 feet above the level of the plain, near the confluence of the Paglia with the Chiana, 7½ miles N.E. of Lake Bolsena (q. v.), and 65 miles N.N.W. of Rome by rail. The seat of a bishop since 590 A.D., it contains, besides its famous cathedral, several ancient palaces, affording fine examples of mediæval art, and has around it remains of the fortifications which formerly made it a place of great strength. The cathedral of O., a magnificent structure in the Italian Gothic style, was commenced in 1290 and was finished in the end of the 16th c. It is built in alternate courses of white and black marble, and is 294 feet in length by 109 in breadth. The façade, which is 160 feet high, is especially rich in bas-reliefs and mosaics, and is said to be the largest and most gorgeous 'polychromatic' structure in existence. The people are chiefly engaged in the production of wine, the wine of O. being well known and highly esteemed in Rome. Pop. (1874) 14,455. The town, which stands on the site of the ancient Etruscan city Volsinii, received in the middle ages the name Urbs Vetus (old city), of which the present O. is a corruption.

Orycteropus, a genus of *Edentate* quadrupeds, represented by the *O. Capensis*, ground hog, or 'aardvark' of S. Africa. This animal somewhat resembles a clumsy pig in form. It has long ears; its body is covered with coarse hair, and it attains a length of 5 feet, inclusive of its tail. The toes are provided with very strong claws, by means of which the O. burrows in the earth. The O. is active at night. It subsists, like its neighbour the S. American Ant-eater (q. v.), on ants and other insects, which it captures by means of its long tongue and glutinous saliva. It has no incisor or canine teeth; the premolars number 14 above and 12 below, and there are 10 molars in each jaw.

Oryx (*Oryx Leucoryx*), a species of Antelope (q. v.), allied to the Gems-Bok (*O. Gazella*), and found in N. Africa in large herds. The horns are about 3 feet long, and are bent backwards in a curve of considerable extent. The colour is a light grey, marked with brown and black. The average height is 3½ feet. The O. is represented on ancient Egyptian monuments.

Osage Indians, a branch of the once great family of the Sioux, are now settled in the Indian Territory and in Nebraska, S. of the river Plate, and N. of the Cherokees. See INDIANS, AMERICAN.

Osage Orange is *Machura aurantiaca*, a deciduous-leaved tree belonging to *Moraceæ*, and a native of the southern United States. It is furnished with strong thorns, and as it can be kept dwarf is trained for hedgerows, but with full liberty, in a favourable situation, it attains a height of 60 feet. The timber is elastic, and is suitable for carriage-poles, &c.; indeed, the Indians formerly used to make their bows from it, and the name of 'bow-wood' is still retained. The tree resists severe frosts, and has been introduced into Britain. Its fruit is of a golden colour, about the size of an orange, consequently is tempting to the eye, but scarcely edible. A yellow dye is obtained from the root.

Osa, a city of Japan, on a deep inlet in the S.E. of Nipon, and at the mouth of a river which, by several branches, drains the great lake Biwako, 250 miles in a direct line S.W. of Yedo, and 30 miles S. by W. of Kiyôto, to which a railway is (1876) being constructed to form part of a projected trunk line from that city to Yedo. The city is intersected by many streams, spanned by bridges, and has a mint and college, and many palaces of the old Daimios. On the W. side of the bay is the port of Hiogo, to which most of the foreign trade of O. has passed, and which is connected with O. by railway. O. is, however, the seat of considerable manufactures, on a European method, of paper, sugar, glass, slight woollen goods, and hats and caps. In 1875 there were here twenty-four British residents, and a mission supported by the Church of England Missionary Society. Though the foreign trade has declined, Japanese steamers enter O. almost daily from the inland sea with native produce, and from Yokohama, with foreign goods purchased by

Japanese merchants there. In 1875 the imports in foreign vessels alone amounted to £118,579, the exports to £44,066. Hiogo, opened to foreign commerce in 1863, had a British community of 163 adults in 1875. Its exports are chiefly tea (in 1875, 7,649,020 lbs.), rice (value \$793,390), copper, bronze ornaments, tobacco, camphor, porcelain, lacquered ware, fans, isinglass, seaweed, and vegetable wax. As many as three million fans, valued at \$90,000, were exported from O. and Hiogo in 1875, chiefly to the United States. In 1875 the exports of Hiogo amounted to \$3,092,405, and the imports to \$5,726,797. The pop. of O. is 80,000, of Hiogo 6000.

Osborn, Admiral Sherard, born April 25, 1822, entered the navy in 1837, and was present at the capture of Canton (1841), and of the Woodang Forts (1842). As commander of the *Pioneer* in the Franklin Discovery Expedition of 1849, he made a memorable sledge journey to the extreme western point of Prince of Wales' Land (1851); and as post-captain of the *Vesuvius* he led the advanced squadron in the Sea of Azof (1855), at the close of the Crimean War being made a C.B. and an officer of the Turkish Medjidie and French Legion of Honour. He served through the second Chinese war (1857), ascended the Yangtze as far as Hankow, 600 miles from its mouth (1858), and in 1862 accepted from the Chinese government the command of a squadron for the suppression of piracy. O. returned home (1864) to test the newly-turreted *Royal Sovereign*, was for some years managing agent of the Great Indian Peninsula Railway at Bombay, and at the time of his death (May 6, 1875) was serving on a committee for the Arctic Expedition of 1875. O. was author of *Stray Leaves from an Arctic Journal* (1852), *Quedah, or my Journal in Malayan Waters* (1857), *Japanese Fragments*, (1860), &c.

Osborne Series is the lowest member of the middle Eocene (q. v.) formations. It is divided into two groups—the lower, the Nettlestone Grits, consisting of shelly sandstone and yellow limestone, and the upper, the St. Helen's Sands, composed of light-coloured sands, clays, and marls. They occur in the Isle of Wight, are of fresh and brackish water origin, and have fossil species of plant and animal of the usual tropical characters.

Oscans (Lat. *Osci* or *Opsci*, Gr. *Opikoi*, connected by Mommsen with Lat. *opus*, 'work'), an ancient Italian race, occupying Campania, and closely connected if not identical with the Ausonians. Invaded from the N. by the Samnites in the 5th c. B.C., they became amalgamated with their conquerors, who borrowed at once the Oscan name and language. The latter, which stood in the same relation to Latin as French to Italian, continued a spoken dialect till the 1st c. A.D. Specimens of it, now rendered intelligible by the labours of Mommsen, are preserved to us in the *Graffiti* (q. v.) of Pompeii, in the legends of coins struck by the Confederates in the Social War, and in various inscriptions. The most famous Oscan inscriptions are the Bantine Tables, of thirty-eight lines, discovered at Opido in 1793; the Cippus Abellanus, which till 1745 was employed as a doorstep at Avella; the Bronze Tablet of Agnone, discovered in 1848. The *Atellanæ* (q. v.) were of Oscan origin, and Ennius, Pacuvius, and Lucilius, as natives of Calabria and Campania, may be deemed the representatives of Oscan literary genius. 'Oscan,' however, was used by later Roman writers as synonymous with 'barbarous' (cf. Plin. xxix. 1, and Juv. Sat. iii. 207). See Mommsen, *Oskische Studien* (Berl. 1845), and *Die Unteritalischen Dialekte* (Leips. 1850); Friedländer, *Die Oskischen Münzen* (Leips. 1850); Huschke, *Die Oskischen und Sabellischen Sprachdenkmäler* (Elberf. 1856); and Rabasté, *De la Langue Oské d'après les Inscriptions et de ses Rapports avec le Latin* (Par. 1867).

Oscar I., Josef Frans, King of Sweden and Norway 1844–59, only son of General Bernadotte and Desirée Clary, was born in Paris, 4th July 1799. When his father was chosen Crown-Prince of Sweden, O., then only eleven years old, was made Duke of Södermanland. His education was conducted with the greatest care. In 1814 he accompanied his father in the war with Norway, his first and last campaign, and on the 19th June 1833 he married Josephine Maximiliane Eugénie of Leuchtenberg (born 14th March 1807). While Crown-Prince, O. was familiarised with civil as well as military power, being chancellor of the three universities, high-admiral, and chief general of artillery, and being at different times provisionally

entrusted with the chief power, as vice-king of Norway in 1824 and 1833, and, during his father's sickness, of both Norway and Sweden. He also gave much attention to art and science, was a successful composer of music, and wrote a valuable treatise, *Om Straff och Straffanstalter* (1840). On his father's death, 8th March 1844, O. ascended the throne. His earliest efforts were devoted to the acknowledgment of absolute equality, and the fostering of friendly relations between his kingdoms. His reign was a period of unexampled prosperity for both kingdoms, and he was completely successful in preserving their neutrality during the disturbance of European politics in its latter years. He had scarcely recovered from a severe attack of a sickness that had affected him for many years, when the zeal with which he entered into the complications resulting from the Crimean War broke his strength, and forced him to resign the government to the Crown-Prince, 11th September 1857. After a daily decline of two years, he died 8th July 1859. His children were Karl Ludvig Eugen (Karl XV.); Fredrik Gustaf O. (1827–52); O. Fredrik (O. II.); Charlotte Eugénie (born 1830); and Nikolas August (1831–73).—**Oscar II., Fredrik**, third son of the preceding, King of Sweden and Norway from 1872, was born 21st January 1829. He received the title of Duke of Södermanland, and entered the navy at an early age, and in 1845 he became after examination a sub-lieutenant in the fleet, from which he advanced by degrees to vice-admiral. Meanwhile he had made great progress in many studies, had learned much of the institutions of foreign lands, and had appeared as a writer on naval affairs and Swedish military history, and also as a poet. His collection of poems, *Ur Svenska flottans minnen*, received (1857) the prize of the Swedish Academy. After having several times, as first prince of the blood, held the government during the travels and sickness of Karl XV., he received the crown on the death of the latter, 18th September 1872. Crowned at Stockholm, 12th May 1873, he undertook a journey through the most northerly provinces of his dominions, and was again crowned at Throndhjem on the 18th July of the same year. On the 6th June 1857 O. married, at Biberich, Sophie (born 9th July 1836), daughter of Duke Wilhelm of Nassau, by whom he had four sons, O. Gustaf Adolf, Duke of Vermland (born 1858), O. Karl August (born 1859), O. Karl Wilhelm (born 1861), and Eugen Napoleon Nikolas (born 1865).

Oscott, a village in the parish of Handsworth, Staffordshire, 4 miles N. of Birmingham, is the seat of St. Mary's College, one of the largest Roman Catholic schools in England. It was founded in 1794, and rebuilt by Pugin in 1840, at a cost of £60,000. A fine church is attached to the buildings, which are cruciform in shape.

Osculation. Two curves are said to be in O. when they are in the closest possible contact with each other. The degree of contact (see CONTACT) is determined by the number of constants which enter into the equation of the curve of lower degree. A straight line involves two constants, and has contact of the first order with the curve under consideration. When it thus osculates it is called the tangent line. A circle involves three constants. Its closest contact is of the second degree, and when it so osculates it is called the osculating circle. The plane in which it lies is obviously the plane containing three contiguous points on the curve, and is known as the osculating plane. A plane curve, therefore, lies in the plane of its osculating circle. The osculating plane of a tortuous curve is constantly rotating as we pass along the curve, and its rate of rotation per unit of length of the curve is the *tortuosity* of the curve, exactly as the rate of change of direction of the tangent per unit of length is the measure of the absolute curvature. The radius of the osculating circle is the radius of absolute curvature of the curve, plane or tortuous.

Oshkosh, a city of Wisconsin, U.S., on the W. shore of Lake Winnebago, and at the mouth of the Fox River, 15 miles N. of Fond du Lac, and 80 N.N.W. of Milwaukee by rail. It is the second most important commercial city in the State, and has 40 shingle and saw-mills, 12 sash, door, and blind factories, and large work for the making of farm implements, the State normal school, 4 newspapers, &c. Pop. (1870) 12,663.

Osian'der (prop. *Hosemann*), **Andreas**, a once famous divine of the Reformation period, was born at Gunzenhausen, near Nürnberg, Franconia, in 1498, studied at Ingolstadt and

Wittenberg, became first a pastor in Nürnberg (1522) and then a professor of theology in the University of Königsberg (1548), where he died suddenly in 1562. O. supported Luther in his controversy with Zuinglius regarding the eucharist, but came into collision with the Lutherans on the subject of justification. In two disputations (1549, 1550), and in his principal work, *De Unica Mediatione J. C.*, &c., he maintained that what Protestants called justification is properly redemption, since the Greek *dikaion* means to make just, and can only by metonymy mean to declare just in the forensic sense; and thus justification is properly what is called sanctification. In connection with this he held that Christ did redeem men by the satisfaction he rendered to divine justice; but that the righteousness of Christ by which the believer is justified is entirely the divine nature of Christ, 'the essential righteousness of God,' 'the divine essence,' 'God himself.' His followers, called Osiandrista, continued the controversy after their leader's death, till in 1567 by the *Corpus Doctrinae Prutenicum* they were finally banished from Prussia. See Wilken, *Andreas O.'s Leben, Lehre und Schriften* (Stralsund 1844). His son, Lukas O. the Elder (b. 1534, d. 1604), and his grandson, Lukas O. the Younger (b. 1587, d. 1638), were, like their father, inveterate controversialists.

Osier is the name given to those species of *Salix* used for basketmaking and other wicker-work. It is said that in the trade about 300 different varieties are recognised. This subdivision of course is purely technical, as botanically, with few exceptions, the whole series range under *S. viminalis*, *S. triandra*, and *S. purpurea*. The first bears the name of the common O., and is the best for hoops or work requiring rods of two years' growth. It will throw up a shoot of 12 feet, and is the representative of the soft-wooded group. From the others it may readily be known by its long narrow leaves, with a silvery silky covering on the under side. The second is the prominent representative of the hard-wooded kinds adapted for white basket-work, and comprises some of the most pliant and durable varieties in the use of the manufacturer. It is often called the French willow. The third, called the purple O., yields rods qualified for the finest work. A hybrid between it and the first, called *S. rubra*, when cut down, will make shoots of 8 feet in a season, and they are the best adapted of any for purposes where unpeeled rods are required. For the production of the O. what are called O.-plantations, holts, beds, or grounds are formed, where such kinds are grown which best meet the wants of the market to be supplied—this varying according to local circumstances. The soil most suited for an O. plantation is a strong loam, and the most favourable position is where it can be flooded at will and yet the land be well drained. The O. will not grow in water-logged land, nor in peat bog, nor in sandy soil; it will, however, grow on land occasionally overflowed by salt water, if it is suitable in other respects. To form the plantation, cuttings must be used, not rooted plants, and they are best taken from branches one or two years old. They should be pushed into the soil fully 9 inches or their whole length, and placed at a distance of 18 inches apart, which gives about 20,000 to the acre. If this plan is adopted straight shoots will be secured, and when gathered they must be cut to the ground. What are known as pollard trees soon decay, and only serve to harbour destructive insects. A well devised O. plantation will last fifteen to thirty years. Notwithstanding that about 7000 acres are devoted in Britain to O. growth, the consumption is much in excess of the home supply, upwards of 5000 tons, of the value of £40,000, being annually imported from neighbouring European countries. It seems probable that Australia will soon enter into the trade. If O. are planted on the banks of rivers they are of great value in preserving the soil from being washed away, by reason of the grasp and tenacity of their long fibrous roots. The word O. is French, and comes from a Celtic word meaning water or oose (as in the rivers Oise, Ouse, Ose). Withy is a synonym of O. See **WILLOW**.

Osi'ris, the son or husband of Isis, and the many-eyed God of the Lower World (also said to be born from the egg of the cackler or goose, an emblem of Seb), was with his son Horus, the last of the gods who ruled over Egypt. He was put to death by the wicked Typhon, and raised again to be the Judge of the Dead. He appears in a mantle coloured like fire, bearing a crook and a whip, two feathers, and on his head a Nilotometer. He is also called Revealer of Good and Lord of the

Tombs. The myth appears in all sepulchral formulae and rites, especially in Lower Egypt. A Louvre hieroglyph identifies him with the sun. Many cities, such as Sais and Busiris, claim the honour of being his burial-place. Tradition assigns his birth to Mount Sinai. At Memphis he became united to Pthah; and also to the bull Apis, and he was a member of the Trinity—Isis, Os, and Nephthys. Xenophanes ridiculed the idea of a mortal and a divine nature in one person, which he saw involved in the annual lament of the Egyptians for the death of O. O., at a later time, appears as Setapis, so much worshipped at Rome; and he also answers in some respects to the bearded Bacchus, although the Greeks called him the Sinopite Jupiter. The Egyptian kings all traced their descent from O., and in order that the Ptolemies might do this, Maccodon, a new son of O., was invented.

Presentation to Osiris.

The Egyptian kings all traced their descent from O., and in order that the Ptolemies might do this, Maccodon, a new son of O., was invented.

Osman or **Oth'man I.**, the founder of the Turkish dynasty, was born at Sukut in Bithynia in 1259, and was the son of Orthogru, an Oguzian chieftain, who became the soldier and subject of Aladdin, the ninth Seljuk Sultan of Iconium, and established a camp of 400 tents on the banks of the Sangar. O. succeeded his father in the headship of the tribe in 1280. He was a bold warrior, ready and able to seize the opportunity offered by the extinction of the Seljuk line (1299), and the remoteness and decline of the Mongul khans. Crossing the unguarded passes of Olympus, he entered the territory of Nicomedia (July 27, 1299), and invested Nicæa, which surrendered after a five years' siege. Throughout his reign O. made a series of the same successful inroads, increasing his forces by the accession of captives and volunteers, and fortifying the towns and strongholds he had won. He held his court at Kara-Hissar, and founded a mint, though he never assumed the title of Sultan. The conquest of Prusa by his son Orchan, the true era of the Ottoman Empire, immediately preceded O.'s death (1326). From him are derived the names Osmanli and Ottomans applied to the Turks. See Gibbon, *Decline and Fall* (ch. lxi.).

Osman Bazar, a town of Bulgaria, in a valley on the N. side of the Binar Dag, an off-set of the Balkans, 40 miles W.S.W. of Shumla, and on the route from Rustchuk to the Silivo Pass. Its name repeatedly occurred in the Russo-Turkish War of 1877-78, but it was not the scene of any important incident.

Osman Pasha, Ghazi, a distinguished Turkish general, is said to have been born at Tokat about 1832, and to have been educated at a school conducted by his brother, from which he was transferred to the military academy at Constantinople. He obtained a lieutenant's commission in 1853, and on the outbreak of the Crimean War was attached to the general staff at Shumla. After serving with distinction as major in the Cretan campaign in 1867, he obtained rapid promotion to a colonelcy, and subsequently a generalship. He was commandant at Widdin during the Turco-Servian war in 1876, and for brilliant conduct at the battle of Saltschar was created a mushir or field-marshal. The declaration of war by Russia in April 1877 found him still at Widdin, whence he marched to Plevna immediately on the passage of the Danube, entering that town on 14th July. The enemy's vigorous attempts to oust him on the 24th and 31st of July were repulsed with terrible slaughter. From an open town he transformed Plevna into an entrenched camp, which for five months engaged a Russo-Rumanian army of more than 100,000 men, checked the general progress of the invaders, and cost them the lives or services of 50,000 gallant soldiers. In the desperate and unsuccessful assaults in the second week of September alone, their loss was estimated at 25,000 men. The Sultan conferred on O. in October 1877 the well-won title of

Ghazi (Victorious). On General Todleben assuming the direction of the besieging forces he initiated an investment, and his cautious strategy succeeded where the brilliant onslaughts of Skobeloff had failed. Every hope of relief vanished, his stores exhausted, and his troops decimated by disease, O. made a grand but futile effort on the 11th of December to break through the circle of steel which encompassed him. He was himself wounded, and obliged to surrender with 40,000 troops. The Czar returned his sword to the heroic soldier, who has been treated as a prisoner with the greatest courtesy by his conquerors.

Osmium (symbol Os, atomic weight 193), one of the noble metals occurring associated with platinum, alloyed with iridium, ruthenium, and rhodium. It is infusible under the oxy-hydrogen flame. Heated in a current of dry air, O. forms osmic acid (OsO_4), the vapour of which has a very irritating odour. It forms colourless prismatic crystals, which fuse and volatilise below the boiling point of water. The action of sulphuretted hydrogen upon its solution results in the formation of a black precipitate, the tetrasulphide (OsS_4). A protoxide and binioxide of O. also exist. Further it appears to form four chlorides— OsCl_2 , OsCl_3 , OsCl_4 , and OsCl_5 . Of these the bichloride and tetrachloride are formed by direct combination of chlorine with the metal.

Osmose, the name given by Graham to liquid diffusion through a membrane. See **DIFFUSION**.

Osmunda is the principal genus of the tribe or division of *Filices* called *Osmundaceæ*, distinguished by their vertically two-valved spore cases, which have an incomplete ring represented by a few parallel striæ near the apex. There are six species. The fructification is paniculate, and in the type species—the flowering or royal fern (*O. regalis*)—the upper pinnae of the fronds are the spore-bearing portion. This is the largest fern found in Britain, attaining a height up to 10 feet, and is not uncommon in boggy, peaty ground, though it has been much destroyed in many places by drainage and the fern mania. It is widely distributed—

Osmunda regalis.

occurring in the four continents. The term 'flowering' is given in consequence of its handsome fructification, and that of 'royal' has descended from the old herbalists, who supposed it to possess great virtues. The name O. is of doubtful derivation.

Osnabrück ('the bridge over the Hase,' of which 'Osna' is a corruption), the chief town of a circle of the same name, province of Hannover, Prussia, on the Hase, 80 miles W.S.W. of Hannover by rail. It has a Byzantine cathedral of the 12th c., the church of St. Mary, a noble Gothic structure of the 14th c., with a beautifully-carved wooden altar-piece, a Rathhaus containing portraits of princes, ambassadors, &c., and celebrated as the place where the negotiations for the Peace of Westphalia were conducted in 1643-48, and a statue of Justus Möser, the 'Franklin of Westphalia,' designed by Drake, and raised 1836. There are large ironworks and sugar-refineries, and manufactures of leather, linen, tobacco, &c. Pop. (1875) 29,850, of whom a third are Roman Catholics. The *bishopric* of O., founded by Karl the Great in 783, was secularised in 1803. The town has again become the seat of a bishop since 1858. See *Friderici and Stüve, Geschichte der Stadt O.* (Osnab. 3 vols. 1816-26).

Osprey (*Pandion haliaetus*), otherwise named the 'Fishing Hawk,' is a species of *Raptorial* birds belonging to the subfamily of the *Aquilina*, or true eagles. The bill is short and curved, and the wings reach to the extremity of the tail. The second and third quills are the longest. The tail is of moderate

length, the tarsal are strong, and the claws are powerfully made. The O. is now rare in Britain. It inhabits the sea-coast, and is an expert fisher. Its colour is a dark-brown above, and white below, a band of brown colour passing across the chest. The legs and toes are bluish, and the beak and claws black. The average length is about 20 inches, or a little more. The nest is built of sticks, and is placed either on some ruined building or on the top of a tree. The eggs number two or three, and are of a dirty white colour, splashed with brown. The O. is monogamous, and male and female usually pair for life, the one exhibiting signs of distress on the death of the other. The flight is graceful and hovering, and the descent of the bird on the water very rapid.

Osprey.

Ossa (mod. *Ássavos*), a mountain of Thessaly, 6194 feet high, is separated to the N. from Olympus by the Vale of Tempe, and on the S. is connected by a low range of hills (Mavrovuni, 'black mountains') with Pelion, on whose summit O. was fabled to have been piled by the Titans in their fruitless endeavour to scale heaven.

Ossæin, the name given to the substance obtained by steeping a bone in dilute hydrochloric acid, when the earthy matter is dissolved out, and the animal matters left. The O. may be said to represent the gelatin and other matters which form the organic basis of the bone. O. is largely resolved into *gluten* by the action of boiling water, gluten being an albuminous substance closely allied to gelatin itself. O. is insoluble in water.

Ossian (the word is of uncertain derivation) is the name of the Gaelic Homer, who is claimed alike by Scotland and Ireland, and is said to have lived in the 3d or 4th c. of the Christian era. He was the son of Fingal, 'king of the great mountains,' and was renowned for heroic valour and unequalled poetic gifts. Many poems attributed to Ossian have been published at different periods; but the most important by far are those issued by James MacPherson (q. v.) in 1762-63, and to these we shall direct our chief attention.

In the year 1759, MacPherson, then twenty-one years of age, was induced by John Home, author of the well-known tragedy of *Douglas*, Rev. Dr. Blair, Edinburgh, and others, to publish a small volume bearing the title *Fragments of Ancient Poetry, collected in the Highlands of Scotland*, and professing to be translated by him from Gaelic into English. These were so favourably received that his literary patrons sent him on a tour through the Highlands and Islands in 1760, in order to recover any other remains of Gaelic poetry which might have been preserved in those remote regions. It should be observed that this undertaking was not of his devising, and was not carried out in secrecy. He was publicly employed by men of the highest character. He corresponded with Dr. Blair, telling him of the progress he made, and was accompanied by friends and acquaintances, who certify that they saw various old Gaelic MSS. handed to him from time to time, and also helped him frequently in taking down Ossianic poetry from oral recitation. He passed more than a twelvemonth between his native district Badenoch and Edinburgh, in both places employing friends who were Gaelic scholars in helping him to translate from his written stores. In 1762 he published, in London, *Fingal* and fifteen minor poems; in 1763 *Temora* and five minor poems, all bearing to have been translated by him from Gaelic.

The poems profess to be sung by Ossian, old, blind, and the last of his race, to Malvina, the widow of his only son Oscar, who was cut off in the beginning of a most heroic career; and this situation is in entire keeping with the tone of chivalrous refinement and deep sadness which pervades them all. There is unsurpassed pathos in the last of them, *Berrathon*, where he alludes to her death as already past—avoiding all description of it—and calmly forecasts his own as at hand. Their contents, relating chiefly to war, present a considerable variety both as to locality and incident. *Fingal* refers to an invasion of Ireland by Swaran, King

of Lochlin, or Scandinavia, who defeats the Irish forces under their leader Cuchullin. The king of the Caledonians, Fionn, or Fingal, comes to the rescue, defeats Swaran, but generously dismisses him to his native land without ransom or forfeit. *Temora* also represents him as warring in Ireland. Cairbar had killed Cormac, the king of Ireland, and usurped his throne. Fingal goes to restore the rightful dynasty. The usurper, pretending friendship towards him, invites Oscar his grandson to a feast, and treacherously slays him, but is himself slain by the expiring hero. Cathmor, brother to Cairbar—a noble character—takes up his cause; but after various turns of fortune, is at length killed by Fingal, who places the lawful heir on the throne, and feeling the weight of years now pressing upon him, formally delivers the spear of his father Treunmor—the symbol of sovereignty—to his only surviving son Ossian, and withdraws to his favourite Selma. *Ca Lodin* relates an expedition of Fingal's to Lochlin, where he is attacked by Starno, who is quite the picture of a savage, piratical viking; but as usual the 'great king' with his irresistible sword, 'the son of Luno, or of brightness,' proves victorious. *Carrie-Thura* represents him in Orkney aiding his friend Cathulla against the king of Sora, who had invaded his dominions. But while there is a thread of continuous narrative pervading these longer poems, they are very much made up of episodes relating to adventures in love and war, and especially 'tales of the time of old,' recited by the bards during every pause in the warfare. The smaller poems generally record single expeditions by the king or some one of his heroes, all undertaken for the rescue of innocence and weakness from oppression. But a few, like *Darthula*, *The Songs of Selma*, &c., show instances, as in real life, of sorrow unrelieved, and of evils undressed. The Ossianic poetry throughout is distinguished alike for sublimity and pathos. It is also remarkable as embodying in *Fingal* a character of excellence and attractiveness surpassing that of any hero of romance—remarkable too for the purity and even delicacy of tone which pervades it throughout. Further it is entirely original in bringing before us a strange spirit-border-land, where the ghosts of the departed descend from their clouds, and give warnings and counsels to their friends on earth, without exciting fear or alarm; and also as dealing with nature in a truly primitive and natural manner. Descriptions, whether of scenery or of actions, often very vivid and pictorial, are undimmed by any tinge of that subjectivity or self-consciousness which casts its shadow on all descriptions by minds of modern culture. The mind of Ossian appears passive in receiving images, and reflects them as from the surface of a bright mirror.

These poems, entirely opposed to the tame, conventional style of the 18th c. literature, were received with wonder and acclamation throughout Europe. Within a year they were translated into the languages of France, Germany, Italy, Denmark, and Poland, while edition after edition was called for at home. But amid the general admiration a storm of adverse criticism burst on the head of MacPherson which has not quite died away yet. Dr. Johnson in England, Messrs. Pinkerton and Laing in Scotland, denied alike the genuineness and the merit of the poems, said they were mere forgeries by the pretended translator, and that they were worthless under any view. A strong array of able men, Dr. Blair, Lord Kaimes, Sir John Sinclair, John Home, &c., mustered in defence of their genuineness; and a controversy was carried on for many years with a degree of bitterness seldom equalled in literary warfare. The first demand made upon MacPherson was to exhibit his original MSS., and to this challenge he answered at once by placing his MSS. in the hands of his London publishers, advertising that they were there, and offering to publish them if a sufficient number of subscribers came forward. The publishers, Beckett & De Hondt, certify that these MSS. remained in their hands for twelve months; yet, incredible as it may now sound, no one followed the common-sense plan of comparing them with the English translation. His opponents, knowing nothing of Gaelic, could not make the requisite comparison, and his supporters, very stupidly, took the genuineness for granted. At the end of the twelve months he removed the MSS., and, so far as is known, they were never again seen by friend or foe. He left £1000 for publishing the Gaelic Ossian, and 10,000 lines were in consequence published in 1807, several years after his death; but all the Gaelic thus found was either in his own handwriting, or in that of his friends; nor was there found among his papers a

scrap of information as to the fate of the old MSS. which were unquestionably collected by him, whatever their contents may have been.

Various objections have been brought against the genuineness of these poems, e.g., that the Highlanders were too barbarous to produce poetry of such a high order; also that MacPherson's work was compiled from those of other authors, ancient and modern; but these have been abandoned long ago. The same may be said of the objections based on the difficulty of preserving such a mass of poetry without committing it to writing; and on the comparatively modern style of the language, a necessary result of oral transmission through centuries. But the difficulty arising from the non-appearance of the original MSS., instead of having been removed, has been recently urged in stronger terms than ever by J. F. Campbell, Esq., the accomplished editor of the well-known *West Highland Tales*, and the author of various antiquarian and scientific works. He has ransacked every corner of the Highlands and Islands, and has collected an immense quantity of old legend, both in poetry and prose, including many Ossianic ballads, but he has never found one stanza of MacPherson's Ossian anywhere amid all his researches, and he concludes from this that the current Ossianic ballads were the sole foundation of MacPherson's work—that he never found any MS. but such as contained these, consequently that his Ossian is his own manufacture.

Mr. Campbell's opinion is entitled to great weight, and he has some followers. But his opponents say:—1. If the MSS. which MacPherson advertised for examination were forgeries, his conduct implies recklessness amounting to insanity. The presumption then undeniably is that these MSS. were what they professed to be. 2. It is very possible that these MSS. formed the only record of the poems which they contained. The history of literature affords instances exactly in point. 'Eighty years ago England possessed only one tattered copy of Childe Waters and Sir Cauline, and Spain only one tattered copy of the Cid' (Lord Macaulay's preface to *Lays of Ancient Rome*). Of the fine old poem of *Beowulf* only one MS. exists. Had any of these perished immediately after being printed, the publisher would have been defenceless if charged with forgery; and so it may be in MacPherson's case. 3. When Mr. Campbell says that he did not find a stanza of MacPherson's *Ossian* anywhere, it is answered, that many poems which were remembered a hundred years ago are now forgotten. Further, facts are submitted which prove that at the least some pieces in MacPherson's book are genuine and ancient. In the appendix to the *Report of the Highland Society* on the Ossianic question (1806) testimony is given by several gentlemen of competent scholarship and unimpeachable character that long before MacPherson's Gaelic appeared they took his English translation, compared with it various short pieces recited by old people around them, and found them quite to correspond. Hundreds of lines have been thus verified, and among these may be specially mentioned 'Malvina's Dream' and two Sun Hymns, which, from other sources as well as the *Report*, are proved to be independent of MacPherson, and are among the very gems of his poetry. It is also deserving of mention that Mr. Skene (and no higher authority can be quoted), in his introduction to the *Dean's Book* (p. 48), expresses the opinion that the sixteen 'Fragments' originally published were genuine—the circumstances in which they were published rendering imposture altogether improbable.

It is proper to notice briefly various other collections of Gaelic poetry which help to throw light on the question before us, and which ought to be studied by all who take a part in it. In 1784 the Rev. Dr. Smith published a small vol. of 348 pages, with the title of *Sean Dána, or Ancient Lays*, ascribed to Ossian, Orran, Ullin, &c. They are truly beautiful, and far more polished in language than MacPherson's poems. They treat of Ossianic subjects, but not of those mentioned by him. Dr. Smith gives the names of those from whom he obtained his *Lays*, but no one appears to have questioned these witnesses on the matter. In 1786 there was a miscellaneous collection of Gaelic poetry published by Gillies in Perth, among which are 'Malvina's Dream,' and one or two more of MacPherson's episodes. In 1804 there was a similar miscellany published by the Brothers Stewart, men who were well qualified as editors; and in their book we have the two Sun Hymns formerly mentioned and the poem of 'Conloch and Cuhona' (185 lines) found subsequently in MacPherson's Gaelic. Still unpublished there is the collection of Jerome

Stone, 1750-56, containing eleven Ossianic ballads, but nothing of what is in MacPherson. A collection, by the Rev. D. M'Nicol, minister of Lismore, made about the same period, contains 'Malvina's Dream.' The Kennedy collection (Adv. Lib., Edinb.), made between 1774-83, is very voluminous, and contains many Ossianic pieces, some of which are similar to those published by Dr. Smith. The Irvine MS.—1796-1802—(likewise in Adv. Lib.), while very miscellaneous in its contents, gives the poem of 'Conloch and Cuhona,' also the two Sun Hymns, accompanied with a note in the Rev. Dr. Irvine's hand saying that he got these two from the Rev. Mr. M'Diarmid of Weem, who says that 'he got them upwards of forty years ago from Duncan Robertson, Glenlyon.' This testimony, which has never been overthrown, places these two very beautiful poems entirely beyond MacPherson. In 1862 was published, under the editorship of the Rev. Dr. M'Lauchlan, Edinburgh, by far the most interesting of all our Gaelic MSS. This is known as the *Book of the Dean of Lismore*, and was written 1512-26. It contains many heroic ballads, nine of which are attributed to Ossian. Space forbids any minute account of this collection, but it proves clearly that upwards of 300 years ago Ossian was held to be the prince of poets, as Fingal was the king of heroes. We mention, in the last place, *Leabhar na Fhinn, or the Book of the Fingalians*, published in 1872 by Mr. Campbell, already referred to. This is a collection of all the Ossianic ballads preserved, whether in print, in MS., or in the memories of men still living. The various versions from 1520 to the present day are carefully placed side by side, and very elaborate notes are added. We have already mentioned the conclusion which he draws from these—that they comprise all the Ossianic poetry which existed in the days of MacPherson, and that it was entirely on them he founded his work.

It is needless to discuss the claims which Ireland puts forward to MacPherson's Ossian. Whether Fingal be a myth or a historical character, whether he ruled in Ireland or in Scotland, whether the Irish poetry be superior or inferior to MacPherson's, it is certain that MacPherson never was in Ireland, nor got a line from an Irish source. His poems, such as they are, are unquestionably Scottish, not Irish. Mr. Campbell and a few others maintain that he composed his work in English, and subsequently translated the chief portions of it into Gaelic; but the majority of Gaelic scholars are opposed to this view, and among these is Mr. Skene, who, while maintaining that he interpolated largely, holds the English theory altogether unreasonable. MacPherson's Gaelic was published in 1807 with a Latin translation, copious dissertations, and notes. An edition containing the mere text was published in 1818, another in 1859, and in 1870 appeared a very elaborate work by Dr. Clerk, minister of Kilmallie, containing Gaelic text, with a literal English translation, side by side with MacPherson's, and numerous notes, in which two prevailing errors regarding the Gaelic Ossian are removed—(1) that it contains scarcely any allusion to religion, and (2) makes no mention of clans or tribes. It is shown that there is frequent reference to religious worship, and that *clans* are mentioned over and over again.

We have thus stated everything which we know to be capable of throwing light on the vexed question of the genuineness of MacPherson's Ossian. We think there are very few among those competent to judge who will maintain with Mr. Campbell that these poems are an absolute forgery, entirely the work of MacPherson. His inference, resting only on proof of a negative kind, which can never be carried out exhaustively, is at the best only a presumption. The testimony of Rev. Mr. MacDiarmid regarding the Sun Hymns, and of several other persons to other short pieces, as having been known long before MacPherson's * Gaelic appeared, and by people wholly unacquainted with him, has not hitherto been discredited. The irresistible conclusion in these circumstances, then, seems to be that MacPherson's book contains, at least, several short poems, and these of great beauty, which tradition had long preserved as the P. of O.; so that here we have truly the 'Fragments' of ancient Gaelic heroic poetry. That he has joined these detached ballads together, in order to carry out his favourite idea of an 'epic poem,' seems also an

irresistible inference. The extent of his supplementing it is very difficult now to ascertain; but we may fitly close our remarks in the words of Matthew Arnold (*Lectures on Celtic Literature*, pp. 152, 153), who, after making due deduction for what is 'forged, and modern, and tawdry,' and for what may be of Irish origin, adds . . . 'there is still left in the book a residue with the very soul of Celtic genius in it, and which has the proud distinction of having brought this soul of the Celtic genius into contact with the genius of modern Europe, and enriched all our poetry by it. Woody Morven, and echoing Sora, and Selma with its silent halls! We all owe them a debt of gratitude, and when we are unjust enough to forget it may the Muse forget us!'

Ossification, the process of bone-formation. Bone is formed from cartilage or gristle, or from fibrous tissue. Hence the process of O. is described as being either *inter-cartilaginous* or *inter-membranous*. Some physiologists recognise a third process, to which they give the name of *sub-periosteal* O.; but this is simply a modification of the second process. The long bones of the body are formed from cartilage; the flat bones (such as those of the side of the skull, &c.) from fibrous tissue. When cartilage exhibits the process of O., its cells appear to undergo a marked increase in numbers. The cells arrange themselves in rows, their long axes lying transversely to that of the future bone. A section through cartilage, at the point where O. is commencing, shows that nearest the *centre* or active point of O., there are large cells or *osteoplasts*. These are arranged in parallel rows, and contain granular matter. Below the osteoplasts the cartilaginous substance is being encroached upon by the calcareous or limy material which is to form the typical and characteristic bone-substance. This is deposited around spaces in the form of rings, and is furnished by the minute bloodvessels which extend into the cartilage from the periosteum, and finally come to occupy the Haversian canals in the fully formed bone. Thus the process of O. is essentially one of lime deposition within a cartilaginous matrix or basis. The *shaft* of a long bone is at first solid. It becomes hollow by the absorption of the central material, and the medullary canal containing the marrow is thus formed. The *periosteum* or membrane which closely invests the surface of bones, and which supports the bloodvessels of the bone, appears to contribute largely to the work of O., by increasing the thickness of the bony tissue. The importance of the *periosteum* in the growth and repair of bone was fully demonstrated by Professor Syme of Edinburgh in certain experiments conducted on the limbs of dogs, by way of proving the reparative powers of this membrane. In his *Principles of Surgery*, Mr. Syme states that he removed an inch and a quarter of the radius of a dog, taking away the periosteum, and that he repeated the experiment on the radius of the other leg, leaving the periosteum as far as possible uninjured. Six weeks afterwards the dog was killed, when the bone from which the periosteum had been removed was found to present a great deficiency of bony matter; while in the bone which had had the periosteum left intact, there was already formed a compact mass of new bone.

In the formation of bone from fibrous tissue, a deposit of limy spicules is at first observed to take place. Then certain clear fibres (*osteogenic fibres*) are developed, and when these become calcified, they are seen to enclose in their interior large *osteoplasts* or bone-cells. These ultimately rest in spaces or *areolæ* formed for them amongst the fibres, and become the *lacuna* of the future bone. The bones do not ossify at the same time, but exhibit great variations in the period of attaining full growth. O. begins in the second month of intra-uterine life, and first appears in the clavicle or collar-bone, and then in the lower jaw (fifth to seventh week). The vertebrae, thigh, humerus, and ribs are the next bones to exhibit this process. At the beginning of the third month, the shoulder-blade, frontal bone, the bones of forearm and leg, and upper jaw become developed, and in the course of the third month the other bones of the head, and the palm, instep, and digits are ossified. In the fourth month the iliac bones and small bones of the ear are developed; and in the fourth and fifth months the pubis, ischium, breast-bone, and ethmoid exhibit the progress of O. The calcaneum and astragalus of the ankle ossify in the sixth and seventh months, and the hyoid or tongue-bone in the eighth month. Thus at birth many portions of the body are still unossified (e.g., the ends of all the long bones, all the wrist bones, the coccyx,

* For these and all the principal statements regarding the question, we refer to the Highland Society's Report, with its valuable Appendix, which must be carefully examined by any one who wishes to know the facts of this interesting subject.

&c.). The term *epiphysis* is applied to the centre of O. at the end of a long bone, the *diaphysis* being the centre of O. for the shaft. The shaft is first ossified. Other centres of O. named *apophyses* are found (as in vertebræ) in the development of projecting parts or processes.

Osta'de, Adrian Van, a famous artist, was born at Lubeck, Germany, in 1610, formed his style in Holland under Frank Hals and Rembrandt, and closely followed Teniers in many of his mannerisms. He was fond of painting drinking scenes, lively farmyards, cottage interiors, and in particular winter scenes, his management of snow being unrivalled. O. died at Haarlem in 1685. The warmth and depth of colouring which distinguished his pictures also marked those of his brother **Isaac**, who was born in 1617, and died in 1654. The best English collection of the elder brother's pictures is that of the Dulwich Gallery. Sir Robert Peel's specimens of Isaac's style are very fine. See Gädertz's work on O. (1869).

Ostashkov, a town in the government of Tver, Russia, on Lake Seliger, at the point of departure of the Seliger Ovka, a small affluent of the Volga, and 250 miles N.W. of Moscow. It is famed throughout Europe for its manufacture of leather, and produces yearly some 200,000 pairs of white boots called 'Ostashi.' Other industrial products are axes, scythes, cotton goods, and sugar. Pop. (1870) 10,806.

Ostende ('the east end,' i.e., of the canal), next to Antwerp the second port of Belgium, province of W. Flanders, on the coast, 20 miles from the French frontier, and 14 W. of Bruges, with which it is connected by canal and railway. It has passenger and mail communication daily with Dover (seven hours), and in summer attracts some 20,000 visitors (mostly Germans and English) exclusive of the immense number of travellers who arrive and depart on the same day. Its sea-bathing is particularly delightful. An excellent promenade is the Digue or breakwater (3280 feet long), built of great stone blocks, and extending nearly parallel to the seaward rampart. O. has two spacious floating basins and handsome quays for the Dover packets, finished in 1874, while the fortifications have been in great part demolished (1876) to make room for several fine new streets, an hospital, and other buildings. There are breweries, distilleries, sugar and salt refineries, oil-mills, and brick kilns (producing yearly 80 million bricks), but the great industry is fishing. So-called 'O. oysters' are nearly all English 'natives' brought from Whitstable and Barnham, and fattened in the numerous 'parcs' here, before being exported in barrels to all parts of the Continent. In 1872 150 fishing smacks belonged to O., and of these 139 were engaged in the cod fishing on the Dogger Bank. In 1873 the exports amounted to £597,870 (£596,850 to England), and the imports to £1,779,580 (in transit direct £1,163,873, total from England £1,132,732). Of the former, the chief articles are butter, meat, wool, hops, and eggs (3,640,336); of the latter, salt, guano, timber, coal (1873, 113,802,000 kilogrammes), chemicals, woollen fabrics, and iron. In 1873 there entered and cleared the port 1363 vessels of 310,293 tons, and in addition there entered 724 mail steamers of 259,304 tons. In 1873 the number of passengers who embarked and disembarked to and from England was 45,228. Pop. (1874) 16,533. Old O. was destroyed by the sea in 1334. The present town, fortified by the Prince of Orange in 1583, after a memorable siege of three years surrendered to the Spanish under Spinola in September 1604.

Osteocoll'a (Gr. *osteon*, 'bone,' *kolla*, 'glue') is another name for bone-glue. It is prepared by digesting in superheated water the gelatine that remains after bones have been treated with muriatic acid to remove the earthy phosphates.

Osteolep'is (Gr. *osteon*, 'bone,' and *lepis*, 'a scale'), a well-known extinct genus of Ganoid (q. v.) fishes, the remains of which occur only in the Devonian rocks. O. belongs to the section *Crossopterygidae* ('fringe-finned'); the paired fins consisting of a central lobe, to the sides of which the fin-rays are attached. In O. there were two dorsal fins. The scales were rhomboidal and smooth. The tail-fin was markedly *heterocercal*, or unequally lobed. The first dorsal fin was near the middle of the back, and the mouth was well provided with teeth.

Osteology, the department of anatomy which treats of the structure, form, disposition, and development of the skeleton of animals. See BONE, OSSIFICATION, SKELETON, &c.

Ostero'de, a town of Prussia, circle of Hildesheim, at the W. base of the Harz Mountains, and on the Söse, 20 miles N.E. of Göttingen. It has many picturesque old houses, an ancient castle, a hydropathic establishment, large grain stores for the supply of the neighbouring mines, important manufactures of cottons, woollens, and wooden wares, and Scherenberg's extensive white-lead and small-shot factory. Pop. (1875) 5658.—Another town of the same name, in the circle of Königsberg, has a timber trade and a pop. (1875) of 5735.

Os'tia (Lat. 'mouths'), a city of Latium, at the mouth of the Tiber, 14 miles W.S.W. of Rome, was founded, according to tradition, by Ancus Martius, and in the Second Punic War had risen to be an important naval and mercantile station. In Sulla's time it had a pop. of 80,000 inhabitants, and was famed for its saltworks and grain-trade with Sicily and Sardinia. But the Tiber constantly receding from O. in consequence of alluvial deposits, Claudius constructed a new basin 2 miles to the N., which, enlarged by Trajan, was called *Portus Augusti et Trajani*, and about which a new town sprang up, *Portus Ostiensis*. O. nevertheless remained a flourishing and populous place under the earlier emperors, and was adorned by Hadrian, Septimius Severus, and Tacitus. It declined on the fall of the Western Empire, and in 827 was in ruins. Its remains, now 3 miles from the S. bank of the Tiber, include a temple of Jupiter, a theatre, baths (excavated in 1867), and a shrine of the Magna Mater (1869). The modern village of O., half a mile from the old town, founded by Gregory IV. in 830, lost the importance which it had enjoyed during the Middle Ages, on the reopening of the right arm of the Tiber (1612), and has now only 50 inhabitants.

Ostra'cion, a genus of Teleostean fishes, belonging to the suborder *Plectognathi* (q. v.). It includes the 'trunk fishes.' The O. *cornutus*, or horned trunk-fish, is a good example. In the O. the body is encased in a stiff inflexible armour of scales, the fins protruding through apertures in the armour. The name 'Coffer fishes' is frequently applied to the species, all of which are natives of tropical seas.

Ostracism, in the words of Aristotle (*Pol.* iii. 8), was a means whereby 'democratical states used to remove from the city for a definite period those who seemed to be pre-eminent above their fellow-citizens by reason of their wealth, the number of their friends, or any other means of influence.' The senate and ecclesia having decided on the necessity of such a step, each of the citizens received a tile (*ostrakon*) on which he might inscribe the name of the person to be ostracised, who, if there were 6000 votes against him, had to quit the city within ten days for a period of ten (or later of five) years. As O. was simply a precautionary measure, it involved no confiscation of property, was followed by a restoration of all civic privileges, and could at any time be revoked by popular vote. The system was instituted at Athens by Cleisthenes in the 6th, and abolished by Alcibiades in the 5th c. B.C. It also prevailed at Argos, Megara, Syracuse, and Miletus, a leaf, however, taking the place of the tile in Sicily, where it was accordingly known as *petalism*. See Grote's *History of Greece* (part ii. ch. xi.).

Ostracoda, an order of the class *Crustacea* (q. v.), represented by several genera of small organisms collectively named 'water-fleas.' To this group belongs the genus *Cypris*, found in fresh water; *Caudona*, in brackish streams; and the marine genera *Cythere* and *Cypridina*. The body is enclosed within a shell or *carapace*, which consists of two valves, united along the back by a flexible membrane. The valves are closed by the action of a special (*adductor*) muscle. The gills or branchiæ are attached to the hinder jaws. The O. are represented as fossils in rocks beginning with the Lower Silurian strata. They are known as fossils through the preservation of the valves of the shell.

Ostrich (*Struthio*), a genus of *Cursorial* or *Ratitæ* birds distinguished by its size, and by having only two toes on each foot. The O. (*Struthio camelus*) is the type of the family *Struthionida*. The nostrils are in a broad groove about the middle of the bill. The plumes of the wings are especially long, and, as in other *Cursores*, have the barbs of the feathers disconnected

and united to form a web—a conformation giving to the feathers their well-known graceful appearance. The tail is also formed

Ostrich.

of plumes which are long and drooping. The O. inhabits Africa, and affects sandy deserts, over which it travels with wonderful ease and rapidity. In length the adult male may measure from 6 to 8 feet; its plumage is blacker than that of the female. The food of the O. consists of vegetable matters, especially, it is said, of the large wild melons which grow plentifully in its native regions. In habits the O. is gregarious. It is also polygamous, one male mating with several females. From two to seven females are found in the *suite* of each male. The female lays a number of eggs, which are set upright in the sand and watched with

great care, although they are hatched chiefly by the heat of the sun. Each egg weighs about 3 lbs., and equals in capacity about twenty-four hens' eggs. The shells are employed by the natives of Africa for a variety of purposes, but chiefly as water-vessels. The flesh is said to be palatable but somewhat tough. The mode of hunting the O. varies. When it can be approached near enough, the rifle is used, but the great speed of the bird enables it to distance the fleetest horse, although its habit of running in circles gives the hunter the means of intercepting it. When brought to bay, the O. defends itself valiantly by kicking; the leg being kicked out in front, an action rendered the more formidable by the strong claws with which the toes are provided. The voice of the O. is a deep hollow sound. The average duration of the existence of this bird is stated to be fifteen or twenty years. The wings, as in all cursorial birds, are rudimentary, and are used after the fashion of aerial paddles. The leg bones are specially strong, and many of the bones are *pneumatic* or filled with air. The breast-bone is flat and raft-like, and wants the *keel* for the attachment of muscles, so well seen in birds of flight.

The voracity of the O. is well known. In a tame state it has been known to swallow nails, pieces of glass, large stones, and a variety of other substances. The probable cause of this voracity is the natural tendency exhibited by all grain-eating birds to swallow hard substances, which aid the gizzard in its work of triturating the food. The O. survives confinement for long periods, although its plumage becomes sadly defaced and subject to the attack of parasites. The feathers taken from the recently killed or from the living O. are more valuable than the dropped ones. The back feathers, those above the wings, are most valued, those of the wings and tail ranking next in worth. O. feathers have been prized in all ages for purposes of personal adornment. They surmounted the heads of the Pharaohs of Egypt; and to-day, in England, the head-dresses of ladies presented at court are imperfect without them. O. feathers enter largely into commerce; in 1876 the estimated value of the imports into the United Kingdom amounted to nearly £700,000. Dyed black, they are largely used as undertakers' plumes, a full set being valued at from £200 to £300. Aleppo, in Syria, is the chief place of export for the finest O. feathers. Algiers, Cairo, Senegal, Madagascar, and S. Africa, also export large quantities. The Argentine Republic sends considerable quantities of Rhea feathers, which are commercially classed as O. F. Each healthy full-grown bird reared on the O. farms of Cape Colony produces feathers which fetch on an average £15 a year. See Mosenthal and Harding's *Ostriches and O. Farming* (Lond. 1876).

Ostrich Feathers, a favourite heraldic badge of the princes of the Middle Ages, which by the close of the Plantagenet period had become the peculiar ensign of the Princes of Wales. The Black Prince directed that certain of the shields placed about his monument should be charged with three O. F. ('plumes d'ostruce') upon a sable field.

Ostrog, a town of Western Russia, government of Volhynia, was formerly the seat of the ancient and powerful house of O., but sunk into insignificance on the death of the last prince of that line in 1673. Here under the rule of Constantine Duke

of O., a zealous adherent of the Greek Church and opponent of the Jesuits, a college and printing-press were established, from which issued in 1581 the first Slavonic translation of the Bible. Pop. 8937.

Os'trogoths. See GOTHs.

Ostu'ni (*Ostunium*), a town of S. Italy, province of Lecce, 22 miles W.N.W. of Brindisi by rail. It lies in a district rich in grain, vines, olives, and almonds, and has numerous churches and convents. Pop. (1874) 14,422.

Osuna, a town of Spain, province of Seville, in a fertile plain, 48 miles E.S.E. of Seville. It has a castle perched on a hill, a Gothic collegiate church of 1534, four hospitals, large barracks, and several fine promenades. The university of O. was abolished in 1824. Soult abstracted from the collegiate church some five cwt. of old plate. There are slight linen, iron, and earthenware industries, and a trade in barley, olives, almonds, capers, esparto grass, and wine. Pop. 15,500.

Oswald, King of Northumbria, began to reign in 634 A.D., and restored to his subjects the Christian religion, which had been deserted for paganism by his predecessors Æric of Deira and Eanfrid of Bernicia. Cædwalla, the Welsh Prince, was slain by this king at Denisesburn (Dilston) after a long and bloody battle. Oswald was one of the mildest yet most capable kings of the Heptarchy, and along with Aidan (q.v.), whom he made Bishop of Lindisfarne, sought so earnestly to cultivate the spiritual welfare of his people, that the ecclesiastical chroniclers never tire of detailing his acts of charity and his miracles. He died in battle against Penda, king of Mercia, in the thirty-eighth year of his age, 643 A.D. See Bede's *Hist. Eccl. Gent. Angl.*, Lib. III.; Freeman's *History of the Norman Conquest*; and Green's *History of the English People* (new ed. 1877).

Oswego, a city in New York, U.S., near the E. end of Lake Ontario, at the mouth of the O. River, and at the end of the O. Canal, which links the lakes Ontario and Erie with the Hudson, and 328 miles N.E. of New York city, with which it is connected by rail. It is a great railway terminus, and has a large trade, mainly in importing Canadian grain and lumber. The Kingsford starch works here are probably the largest of the kind in the world, producing thirty-five tons of starch daily, and consuming a million bushels of corn annually. O. has also fifteen flour-mills, capable of producing 6080 barrels of flour daily; ten grain-elevators, with a storing capacity of 2,000,000 bushels; extensive iron and railway works; large malt-houses, barrel-factories, &c. The streets are 100 feet wide, and cross at right angles, and among the public buildings are a city-hall, a U.S. court-house, fifteen churches, a free library with 20,000 volumes, and an opera-house. There are two beautiful parks. Fort Ontario, a casemated structure overlooking the lake and harbour, is garrisoned by a company of the U.S. army. The harbour, at the mouth of the O. River, is protected from the action of the lake by extensive piers; the U.S. government is now (1877) constructing a new harbour outside the old one, which when completed will have a depth of 20 feet, and be one of the best on the chain of great lakes. Pop. (1870) 20,190.

Oswego Tea is a name that was given by the colonists of last century to *Monarda didyma*, a common N. American plant belonging to *Labiata*. They used an infusion of its leaves as a domestic medicine, probably much in the same way and for the same purpose that allied aromatic herbs were in the past used in England. Several other species of the genus have a very strong scent, as *M. punctata*, which is called 'horse mint'—another reminiscence of the 'old country.'

Oswestry, a market-town of England, in Shropshire, 18 miles N.W. of Shrewsbury by rail, has a town-hall, corn-market, assembly-rooms, grammar-school, the ruins of a castle, three banks, and one newspaper. The Cambrian Railway Works, for the manufacture of rolling-stock, were erected in 1865, and extensive sewerage and water systems completed in 1866. Malting and brickmaking are the chief industries. Pop. of municipal borough (1871) 7306, an increase of over 30 per cent. since 1861, due mainly to the development of collieries and quarries in the surrounding district.

Osyman'dyas, an Egyptian king mentioned by Strabo and Diodorus Siculus, but not yet identified by Egyptologists with

any historic personage. He is said to have been twenty-seventh in succession from Sesostrius, to have invaded Asia at the head of 400,000 men, and to have built the remarkable temple at Thebes, called by Diodorus the tomb of O., by Strabo the Memnonium, and now generally known, on the authority of the hieroglyphics, as the Ramesseion.

Ota'go, a district, and formerly a province, of New Zealand, occupying the southern portion of the Middle Island, together with Stewart's Island. Its total area is about 16,000,000 acres, of which 3,000,000 acres are agricultural, 7,000,000 pastoral, and 2,000,000 forest land, the remaining 4,000,000 acres being made up of lakes and mountains. The W. portion is little known, and almost uninhabited, consisting as it does of a congeries of lofty mountains, many of which rise above the snow-line. Several other ranges of considerable altitude also traverse O., and the principal tracts of level land are found in the S. and N.E. The drainage of the mountains forms several large lakes (see NEW ZEALAND), and is carried off by a number of rivers, of which the chief, from N. to S., are the Waitaki, Taieri, Clutha (q. v.), Mataura, and Waiau. These streams are so rapid as to be almost useless for navigation. There are several good harbours both in O. proper and Stewart's Island, but the magnificent sounds of the W. coast (see NEW ZEALAND) are deprived of commercial value by the inaccessibility of the region into which they penetrate. The mineral wealth of O. is very great, including gold, brown coal, iron, antimony, and copper. Gold was first discovered in Gabriel's Gully, near Lawrence, in 1861, and from that date to the end of 1876 the quantity exported from O. amounted to 3,584,179 oz., valued at £14,077,688. Building stone of the finest quality is abundant near Oamaru and Kakanui in the N.E. Fine timber is obtained on the W. and S. coasts and in Stewart's Island, but the interior is almost treeless. The climate of O. is healthy and invigorating, and free from extremes. Snow rarely falls at the coast, and frost is only severe in elevated situations. All the crops and fruits grown in Britain flourish in O. The total area under crop (including land in sown grasses) in Feb. 1877 was 536,753 acres, oats and wheat being the two principal crops. The trade of O. is much greater than that of any other district of New Zealand. The chief exports are wool, gold, oats, wheat, skins, and preserved meats; and the leading industries are manufactures of iron, woollens, pottery, and soap, besides brewing, shipbuilding, and an extensive timber trade. The construction of railways is being vigorously proceeded with, and about 200 miles are now (1878) open for traffic. Much attention is paid to education, and in March 1877 there were in operation a university, two high schools, five grammar schools, and 160 elementary schools, all deriving more or less support from Government.

The first regular settlement of O. was commenced on 23d March 1848 by an association connected with the Free Church of Scotland, but its original class character was effaced by the great influx of miscellaneous immigrants caused by the discovery of gold. From 1861 to 1870 a portion of O. constituted a separate province under the name of Southland. On the abolition of the provinces in 1876, O. was subdivided into 13 counties. The pop. of O. at the census of 1874 was 85,082, but at the end of 1877 was probably about 105,000. The principal towns are Dunedin (q. v.), Invercargill (q. v.), Port Chalmers, Oamaru, Milton, and Lawrence.

Otahe'ite. See TAHITI.

Otal'gia (Gr., lit. 'earache') is a painful affection of the ear of a neuralgic nature, occurring in fits of excruciating pain shooting over the head and face. It is frequently caused by decayed teeth, the removal of which is necessary for a cure; but, in other cases, the treatment is that of neuralgia generally.

O'tary, or **Ota'ria** (from Gr. *ōs*, *ōtos*, 'an ear'), a genus of carnivorous quadrupeds included among the *Pinnipedicæ* or seals, and representing the family of the *Otarida* or 'eared' seals, which are distinguished from the common seals by having a small external ear. They are also known as 'sea lions' and 'sea bears.' They differ markedly from seals in several important points of structure. Their limbs are much freer from the body, and the O. can thus raise themselves, and waddle over the land more easily than seals. Their neck is very flexible, while that of the seals is short. Then the seals have no under fur, while the O. is well provided with a fur below the outer covering

of coarse hairs; this under fur, in certain species of *Otarida* affording the rich *sealskins* of commerce. Several species have hair on the head and neck, forming a kind of 'mane,' whence the name 'sea lions.' In general conformation of body and activity of habits, the O. presents a striking contrast to the seals. The teeth number thirty-six; twenty in the upper and sixteen in the lower jaw. There are six upper incisors, two canines in each jaw, and six molars above and five below on each side. The canines are very large. The food consists of crabs, molluscs, and fishes, the O. being skillful fishers. When a fish is too large to be swallowed at one gulp, the O. bites it in halves, swallows the first half, and then instantly dives to secure the remainder. The stomach always contains a large quantity of pebbles. The O. have a very peculiar distribution. None inhabit the Atlantic Ocean, save in the very southernmost portions. They are first met with on S. American coasts at the mouth of the river Plate; and thence southward they are found all round the coast, and in distant islands, such as Juan Fernandez, Chonos Islands, and the Galapagos. They are numerous on the Californian coast, and extend as far N. as the Aleutian Isles to the coast of Japan. The Prybilov Isles form their most northern limit of distribution. They occur on the New Zealand coasts, and on the S. and E. coasts of Australia. The males grow until they attain the age of six, and the females until they reach four years, when the former weigh each from 500 to 700 lbs., and the latter from 80 to 150 lbs. or more. They return to their island haunts in May, the males arriving first, the females some weeks later. About nine well-defined species are known. These are the *O. Ursina*, *O. Gilliespii*, and *O. stelleri* of the N. Pacific; the *O. jubata* and *O. Falklandica* of the S. Pacific and S. Atlantic; the *O. Antarctica* or *O. pusilla* of the Cape of Good Hope; and the *O. Hookeri*, *O. lobata*, and *O. gazella* of Kerguelen's Land. Immense numbers of these animals are annually slaughtered. A pair of sea lions (*O. stelleri*) are at present (1878) alive in the Brighton Aquarium, where the female gave birth to a young O. in May 1877.

Otchakov, a fortified port of Russia, government of Kherson, on the Dnieper-Liman, 40 miles N.E. of Odessa. A town of great antiquity, it was invested with a transient importance during the wars between Turkey and Russia in the 18th c. Pop. (1870) 5227.

Oth'man Ibn Affan, the third Arabian calif, was born about 574. He was early converted to Islam by his kinsman Mohammed, two of whose daughters he married, and whose secretary he became. In 644, three days after the death of Omar (q. v.), he was raised to the califate, on condition that he would govern according to the Koran. The first successes of his reign in Persia, Armenia, Asia Minor, and Northern Africa were soon followed by a series of disasters, due to O.'s folly in entrusting all commands, not to the bravest warriors, but to his own kinsmen and favourites. A growing discontent, fostered by the adherents of Ali (q. v.), and by the priests, who hated O. for his departure from time-honoured customs, ended in a general rising, and in the assassination of O. by Mohammed, a son of the Calif Abu-Bekr, June 18, 656. The first revision of the Koran was made by O.'s orders. See Ockley's *History of the Saracens*, and Gibbon's *Decline and Fall of the Roman Empire*.

Oth'man, the founder of the Ottoman Empire. See OSMAN.

O'tho, the seventh of the Roman emperors, was born of an ancient Etruscan family in 32 A.D. Profligate and luxurious, the Rochester of Nero's court, he yet governed the province of Lusitania with considerable credit from 59 till Galba's revolt in 68. O. participated in that revolt, hoping to secure the succession to himself, a hope that was baffled by Galba's adoption of Lucius Piso, 10th January 69. Five days later O., greeted as emperor by three and twenty common soldiers, murdered both Galba and Piso, and within twenty hours of his usurpation began to foretell his own downfall. Already a third competitor had arisen in the person of Vitellius (q. v.), whose revolt at Cologne was followed by the advance of the German legions on Italy. After fruitless negotiations O. marched to meet the enemy. In the battle near Bedriacum, between Verona and Cremona, the Vitellians were victorious; and the news being brought to O., who had stayed behind at Brixellum, he stabbed himself, 15th April 69. His Life was written by Plutarch and Suetonius, but the standard authority is the *Historia* of Tacitus (lib. i. and ii.).

Otitis, or **Inflammation of the Tympanum**, is a painful catarrhal affection, the pain often extending over the whole of the head and down the neck, aggravated by swallowing, and often complicated with fever and delirium. The throat is also usually inflamed, and there may be total deafness. The treatment should be of a soothing nature—leeches, hot fomentations, and sedative poultices, with purgatives and opiates. O. may terminate in complete resolution, or matter may discharge itself down the Eustachian tube, or the *membrana tympani* may give way. O. may occur during the course of certain febrile affections, especially scarlatina, and occasionally after measles and hooping-cough. In such cases the mucous membrane of the tympanum becomes red and swollen, the cavity is filled with pus, the ossicles are destroyed, and the walls of the cavity are diseased, causing permanent *Otorrhoea* (q. v.), and incurable deafness.

Otley, a market-town of England, in the W. Riding of Yorkshire, on the Wharfe, 8½ miles N.E. of Bradford by rail, has a cruciform parish church (restored 1869), numerous dissenting chapels, a mechanics' institute, and two newspapers. There are extensive woollen factories, printing-machine works, corn and paper mills, tanneries, breweries, &c. Pop. (1871) 5855.

Otorrhoea is a purulent or muco-purulent discharge from the external ear, caused by chronic inflammation of the meatus or diseased conditions of the *membrana tympani*. O. may be catarrhal, or it may depend upon some constitutional cachexia, of which struma and gout are the most frequent. In the acute stage, the ear should be syringed with warm water, and warm fomentations should be applied to the inflamed membrane. In the chronic stage, mild mercurial ointments, or a solution of nitrate of silver, five or ten grains to the ounce, should be applied on a camel's-hair brush. When abscess occurs in the meatus, a free incision should be made. Should the discharge be very foetid, a weak solution of Condy's fluid, chloride of lime, or carbolic acid may be used for injection.

Otoscope, an instrument used by aural surgeons for examining the *membrana tympani*. In a very good light the membrane can be seen without a speculum; but a silver tube is usually necessary, the light of a lamp, with a reflector behind it, being thrown into the tube. In operative procedure a small mirror is placed on the forehead, in order to leave both hands free. An instrument sometimes called the O., consisting of an indiarubber tube about 18 inches long, is used by the surgeon to hear the air passing into the tympanum by the Eustachian tube, the one end of the indiarubber tube being placed in the ear of the patient and the other in the ear of the observer.

Otranto, a decayed fishing town of Southern Italy, in the province of Lecce, 53½ miles S.E. of Brindisi by rail, is the seat of an archbishop, and has a cathedral and a castle erected by Alfonso of Aragon. It carries on a considerable trade in oil with the Levant. Pop. (1874) 1155. The *Hydrus* of its Greek colonists, and the *Hydruntum* of the Romans, O. was long one of the principal harbours of the Adriatic. On July 28, 1480, it was stormed by the Turks, who slew 12,000 of the inhabitants, and carried off the remainder into slavery.—The *Terra d'O*, or province of Lecce, comprising the heel of the Italian peninsula, has an area of 3293 sq. miles, and a pop. (1874) of 493,263.

Ottawa, an important river in the Dominion of Canada, rises on the watershed between the basin of the St. Lawrence and Hudson's Bay, and flows first in a westerly direction, receiving from the N. the Abitibi, Blanche, and Ketacumaw, then S., expanding into lakes Mijizowaja and Temiscamang, and finally E., being joined from the N. by the rivers Du Moines, Black, Coulonge, Gatineau, Du Lièvre, and Rouge, and from the S. by the Mattawa, Pelewahweh, Bonnechere, Madawaska, and Rideau, and entering the St. Lawrence by three mouths, which encircle Montreal Island and the Isle Jésus. It has an extreme length of over 600 miles, and a drainage area of some 80,000 sq. miles. Its basin is richly wooded, and includes much fertile land, now rapidly filling with settlers. Though impeded by many rapids, it is rendered navigable by an extensive system of dams and canals for river boats and steamers, and forms a channel for a lumber trade that is perhaps the largest in the world. The O. is connected by the Rideau Canal with Lake Ontario, and navigation is possible from it by the Mattawa, Lake

Nipissing, and French River, to Georgian Bay in Lake Huron. There is some prospect of this latter passage, which would shorten the waterway from Montreal to the great lake-ports W. of Huron by nearly two-thirds, being rendered more practicable.

Ottawa, the capital of the Dominion of Canada, beautifully situated on the S. bank of the O. River, 87 miles above its confluence with the St. Lawrence, and at the point where the Rideau Canal joins the river, 125 miles W. by S. of Montreal, and 240 N.E. of Toronto. It is reached by a loop line of the Grand Trunk Railway, and is on the highway of the Canadian Pacific Railway, at present (1878) under construction; in summer lines of steamers run hence to Montreal and the Upper O. The business part of the city is on the W. side of the Rideau Canal, and here are the city-hall, the principal churches, schools, hotels, and other public buildings. Further W. is the suburb of Rochesterville, and the great lumbering depôt of the Chaudière, opposite the recently incorporated city of Hull (pop. 9000), in Quebec province. On the E. side of the canal are the Lower Town and Sandy Hill, composed mainly of dwelling-houses, the Major's Hill, laid out as a public park, and the village of New Edinburgh, containing Rideau Hall, the governor-general's residence. The Falls of the Chaudière, 130 feet in descent, are singularly romantic, and are the chief attraction in the beautiful scenery of the vicinity. O. is the seat of the Anglican bishop of Ontario, and of a Roman Catholic bishop, who takes his title from the city. It has many excellent educational institutions, including the Roman Catholic O. College, with a university charter, a normal school for Central Canada (opened 1876), a Protestant Ladies' College, and two large convents. On Barrack Hill stands its chief architectural ornament, the Parliament Buildings, the grandest pile in America, after the marble capitol at Washington. The city is the central mart of the great Canadian lumber trade, and some 5000 people are engaged here alone in sawing and shipping. American enterprise has developed here an important import trade in provisions and general merchandise. The government employes of all grades in the city number 1300. Three newspapers are published daily. The assessed value of city property in 1869 was \$5,081,679, and in 1875 \$11,254,635. Pop. in 1851, 10,000; in 1861, 15,000; in 1871, 21,000; in 1875, 24,262. More than half of the inhabitants are French Canadians, professing the Roman Catholic faith. O. was founded in 1827 by Colonel By, who constructed the Rideau Canal as an interior line of defence. Bytown, so called after its founder, was incorporated as a city under the name O. in 1854. It became the capital of Canada in 1856, and the government was installed in its new buildings in 1866.

Ottawa, a town of Illinois, U.S., on the Illinois River, 80 miles W.S.W. of Chicago by rail, has large starch and glass industries, several fine hotels, stores, &c., and four newspapers, and is connected by canal with Plaines River and Lake Michigan. In a handsome park on the S. side of Illinois are great mineral springs. Pop. (1870) 7736.

Otter (*Lutra*) a genus of *Carnivorous* quadrupeds belonging to the family *Mustelida*, or that of the weasels. The feet are short and the toe webbed, in adaptation to an aquatic life. The ears are small but prominent, and the tail is rounded and of moderate length. The teeth number thirty-six, and consist of six incisors and two canines in each jaw; the upper jaw having eight premolars and two molars, and the lower jaw six premolars and four molars.

The average length of the O. is about 3½ feet. Specimens have been captured which weighed 40 lbs. The colour is a very rich brown, intermingled with tints of grey; and the outer fur is coarser than the inner coating. The O. is well known from its habit of destroying large quantities of salmon and other food fishes. Its destructive propensities are, however, not limited to

Otter.

•killing and devouring fishes; it rejects large numbers of those it kills, and mangles the remainder by selecting the most juicy portions for food. The O. burrows in the banks of the river it infests. The young vary in number from three to five, and are born in March or April. O.-hunting is a sport which is highly exciting and often difficult. A special breed of dogs, well known under the name of 'otter-hounds,' is employed. These dogs are wiry and powerful, swim well, and possess great endurance and strength of limb and jaw—qualities which an O. brought to bay is likely to put to a severe test. Frequently an enraged O. will bite and maim several of his canine pursuers, and contrive to escape through the perfect command he retains of his faculties and powers of swimming and diving in the most expert manner. The otter-hound is also known by the name of 'Welsh harrier.' The Chinese O. (*L. chinensis*), otherwise named the Indian O., occurs in Asia, and is hunted like its European representative. The fur is of lighter hue than in the latter. This and the Indian O. have been tamed and trained to capture fishes. The Canadian O. (*L. Canadensis*) closely resembles the common O., but may attain a larger size. The sea-O. or Kalan (*Enhydra lutris*) occurs in the N. Pacific Ocean. It is a scarce animal, and possesses a fur of the highest possible value, and may weigh from 70 to 80 lbs. The fur has a black velvety gloss, and is of a rich blackish or brown colour on the upper parts of the body.

Ott'erburn, Battle of. See CHEVY CHASE.

Otto I., son of the Emperor Heinrich I., born in 912, was early married to Edith, grand-daughter of King Ælfred, and was crowned at Aachen in 936. In 937 the Duke of Bavaria revolted against his authority, but was promptly defeated; in the following year O.'s half-brother led the Dukes of Franconia and Lotharingia into a similar rebellion, which was also put down. The consequence was that O. obtained either for himself or his kinsmen all the great duchies, which he swayed with a firm hand. Other wars were carried on by him against the Danes, whose king, Harald, he compelled to do homage and accept Christianity, and against the Poles, whom he added as feudatories of the crown. The Slavs of the Baltic, the Middle Elbe, and the Oder were brought under his authority by two of his markgrafs. In 951 he made a romantic expedition into Italy to espouse the cause of Adelheid, the widow of Lothar, who was then in her nineteenth year, and whom Berengar had seized. Entering Lombardy by the Adige valley, O. forced Berengar to a condition of vassalage and married Adelheid, assuming to himself the title of King of the Lombards. A rebellion was conducted against him in 953 by his son Ludolf, Duke of Swabia, and in 955 the Hungarians made an irruption into Bavaria. The rebellion was suppressed, and O. in person routed the Hungarians at a battle fought near Augsburg. In 961 O. visited Italy for the second time, was crowned King of Lombardy and (February 2, 962) Roman Emperor by Pope John XII., whom he shortly after deposed. 'This restored empire,' writes Mr. Bryce, 'which professed itself a continuation of the Carolingian, was in many respects different. It was less wide, including, if we reckon strictly, only Germany proper and two-thirds of Italy; or, counting in subject but separate kingdoms, Burgundy, Bohemia, Moravia, Poland, Denmark, and perhaps Hungary.' Its character was 'less ecclesiastical.' 'Under him,' says the same writer, 'the Germans became not only a united nation, but were at once raised on a pinnacle among European peoples as the imperial race, the possessors of Rome and Rome's authority.' O. died at Minsleben, in Thuringia, 7th May 973, having previously obtained for his son, through war, the daughter of the Eastern Emperor Nicephorus. See Vehse's *Leben Kaiser O.'s des Grossen* (Dresd. 1827; 3d ed. 1867), and Bryce's *Holy Roman Empire* (Oxf. 1864).—**Otto II.**, son of the preceding, was born in 955, crowned King of the Romans in 961, and reigned along with his father, married the Greek princess Theophanō in 972, and became emperor in the following year. He soon came to warlike issues with the great chiefs, his first contest being with Heinrich the Wrangler of Bavaria, who struck up a rebellious alliance with Harald of Denmark and the Dukes of Bohemia and Poland. They were each in turn defeated by O., and Heinrich was deprived of his duchy. O. was next engaged with Lothar, who seized Aachen and asserted his right to Lotharingia, but having matched as far as Paris O. made him abandon the claim. Revolt at Milan and Rome next drew the emperor across the

Alps, and in the S. of Italy he fought with distinction in Apulia and Calabria. In 982 the Saracens defeated him, and he barely escaped with his life, after which he returned to Rome, where he died, 7th Dec. 983. See Giesebricht, *Jahrbücher des Deutschen Reichs unter der Herrschaft Kaiser O.'s II.* (Berl. 1840).—**Otto III.**, son of the preceding, was born in 980, and crowned at Aachen when only three years old. During his childhood Theophanō undertook the imperial regency. O. was seized by Heinrich of Bavaria, who resented the establishment of female authority and aimed at supreme power, but in 984 he was given up again. The famous Gerbert acted as his preceptor, and reared his pupil 'in the dream of a renovated Rome, with her memories turned to realities.' During the years of tuition O. came to be known as 'the Wonder of the World.' In 996 he led an army to Rome and engaged the troops of Crescentius, the consul, whom he defeated. On that occasion he was crowned emperor. In 999 he lifted Gerbert to the pontificate, and thus began 'that Teutonic reform of the Papacy which raised it from the abyss of the 10th c. to the point where Hildebrand found it.' In the year 1000 O., who had returned from a pilgrimage to the Holy Land, presented himself at the tomb of Karl the Great in Aachen and took from his upright figure a consecrated cross, after which he returned to Rome. He died at Paterno, near Viterbo, 21st January 1002, poisoned it was said by Stephanía, widow of Crescentius, who had first of all ensnared him by her beauty. His body was carried to Aachen and buried beside Karl the Great. 'Short as was his life,' says Mr. J. Bryce, 'and few his acts, O. III. is in one respect more remarkable than any who went before or came after him. None save he desired to make the seven-hilled city again the seat of dominion, reducing Germany, Lombardy, and Greece to their rightful place of subject provinces.' See Wilman's *Jahrbücher des Deutschen Reichs unter Kaiser O. III.* (Berl. 1840), and Bryce's *Holy Roman Empire* (Oxf. 1864).

Otto I., King of Greece from 1833-62, was the second son of King Ludwig of Bavaria, and was born at Salzburg, June 1, 1815. On the 13th February 1832 he was chosen by the Great Powers King of Greece. Being accepted by the Greeks, he arrived at Nauplia, then the capital, on the 30th January 1833, and on the 6th February made a solemn entrance into the town. Till the 1st July 1835 Greece was governed by a regency (under Armanis, Maurer, and others), but even after O. himself took the government, German officials held the chief influence. In 1836 he married the Princess Amalie of Oldenburg, whose interference in the politics of the Greeks was disastrous. She was understood to be the instigator of that reactionary and autocratic policy that lasted till the revolution of September 1843 forced O. to grant a free constitution. Yet he would not fairly yield to constitutional government, but sought to secure an artificial majority in the Chamber by intrigues and bribery. His pro-Russian feeling during the Crimean War gained him some popular favour, which he soon lost, and at the beginning of 1862 O. appealed to Kanaris to form a ministry. But the attempt failed, as he would not accept Kanaris' terms, and in October of the same year an insurrection broke out at several places. On the 22d October O.'s deposition was proclaimed at Athens. He forthwith lodged his protest and left for Bavaria. He died at Bamberg, 26th July 1867.

Otto, or Attar of Roses, is obtained by distilling the flowers of the Provence or cabbage rose (*R. centifolia*), and probably also those of the damask rose (*R. damascina*). The principal farms for the production of the rose, and where the attar is manufactured, are situated in the valley of Kézanlik, in Rumelia, at the foot of the Balkans. The third year after planting a crop is secured, and the bush will yield well for fifteen years. The harvest generally begins in the middle of May, and each morning before sunrise the flowers are gathered, and are distilled by noon on the same day. Into the stills (which hold about 2½ cwts.) the roses are placed with water, and during the process of boiling the attar is carried forward with the steam into the refrigerator. It is collected as it there floats on the condensed water. On an average 3000 lbs. of blossom are required to produce 1 lb. of the attar. The yearly production varies considerably from various causes, but the average of the last ten has been ascertained to be about 55,500 oz., and the price, when pure, may be fairly estimated at 25s. to 30s. per oz. The whole district was devastated during the Russo-Turkish War of 1877-78.

Ottokar II., Przemysl, King of Bohemia 1253-78, son of King Wenceslaus III., was early chosen Duke of Austria, when the old ducal line had died out with Friedrich the Quarrelsome. At twenty-three he married Margaretha (then forty-six years old), sister of the latter and widow of Heinrich, son of the Emperor Friedrich II., but she was afterwards divorced by him. O. also gained possession of Steiermark, for which he had to fight with the Hungarians, whom he defeated at Marchfeld in 1260, and also of Carinthia and Carniola. Soon after his accession he undertook in 1254, in union with the Teutonic Knights, a crusade against the heathen Prussians, whom he subdued, and founded at Pregel a town which, in honour of the king, he named Königsberg. The imperial crown was offered to O., who refused it, but yet would not recognise the election of Rudolf, in consequence of which he had to yield Austria, Styria, Carinthia, and Carniola to Rudolf, and take Bohemia and Moravia as fiefs of him in 1276. When O. shortly after renewed the war, he fell, after a brave resistance, in a battle on the same plain where eighteen years before he had won a glorious victory, in the neighbourhood of Vienna, August 26, 1278. See Lorenz, *Geschichte König O's II.* (Vien. 1866).

Ottoman Empire. See TURKEY.

Otto von Freisingen, a German chronicler, was the son of Leopold IV., Markgraf of Austria, and of Agnes, daughter of the Emperor Heinrich IV. His father dedicated him to the service of the Church. He studied at Paris, and while still a youth was made Provost of the Monastery of Neuburg. O.'s talents, learning, and high birth seemed to point him out for ecclesiastical distinction, but he was destitute of worldly ambition. His stepbrother, the Emperor Konrad III., compelled him to become Bishop of Freisingen, where he died, 22d September 1158. O. has won an honourable place among the chroniclers of the Middle Ages by his *Universal History*, which comes down to 1153, and was continued by Otto of St. Blasius to 1209, and by his *De Gestis Frederici I., Caesaris Augusti*, continued by Radewic. His family connections gave him a knowledge of imperial policy possessed by few, and an access to important documents of which he has liberally availed himself. The best edition of his *Universal History* is in Urstittus' *Germania Historici Illustres* (vol. ii.); of his *Friedrich*, in Muratori's *Scriptores* (vol. vi.). See Wiedemann's *O. von Freising, sein Leben und Wirken* (Passau, 1849).

Ot'way, Cape, a bold headland, forming the S. W. extremity of the colony of Victoria, and the first land usually made by vessels bound from the United Kingdom to Port Phillip. It is situated in 38° 52' S. lat., 143° 33' E. long., and is crowned by a lighthouse.

Otway, Thomas, an English dramatist, was the son of a clergyman, and was born at Trotton, Sussex, March 3, 1651. From Winchester School he passed to Christ College, Oxford, which he left for London without a degree. Hunger naturally turned him into playwright and actor—actor only once, however; for at Sir William Davenant's theatre in Dorset Garden, where he acted 'King' in Mrs. Behn's *Forced Marriage*, 'the full house put him to such a sweat and tremendous agony, he being dash't, spoil him for an actor.' In 1675 appeared his *Alcibiades*, and in 1676 *Don Carlos*, a great success, played for thirty consecutive nights. In 1677 O. published the tragedy of *Titus and Berenice* from Racine's *Berenice*, and a version of Molière's *Cheats of Scapin*. After the production of *Friendship in Fashion* (1678), a 'very diverting,' very indecent comedy, he was shipped off to Flanders as cornet of horse; but he was soon back poorer than ever, and wrote two more tragedies—*Caius Marius*, a mere hash of Shakespeare's *Romeo and Juliet*, and *The Orphans*. In the same year (1680) he scribbled a political piece entitled *The Poet's Complaint to his Muse*. His comedy of *The Soldier's Fortune* (1681) was supplemented by a second part, *The Atheist*, in 1684,—both are poor. *Venice Preserved*, his last, and by far his greatest play, appeared in 1682. Its wretched author died in London, April 14, 1685. Some say that he died of fever incurred by his irregular habits; others, that he choked with a piece of bread given him in charity. O. excelled in domestic tragedy; in delineating passion, the miseries and the ecstasies of love, the dark depths of hate and the steadfastness of virtue, he has left us scenes unsurpassed, perhaps unrivalled, in our literature. *The Orphans*, banished from the stage because

of its somewhat impure plot, continues to be read with tears for its pathetic incidents; while *Venice Preserved*, with scarcely a virtuous character but the heroine, is justly deemed one of the most melting and thrilling plays since Shakespeare's time. No finer love scenes were ever penned than those between Jaffier and Belvidera. The last edition of O. is that of Thornton, with notes and life (3 vols. 1813). See *Cornhill* for December 1877.

Oude, or Oudh, pronounced 'Owd' (*Avadh* or *Ayodhya*, 'the invincible'), a province of British India, bounded N. by the independent state of Nepal, and encircled on all its other sides by the N.W. Provinces, with which it has been amalgamated since 1877; on the S.W. it is bordered for a long distance by the Ganges. Area, 23,930 sq. miles; pop. (1869) 11,220,232. O. is the most densely populated province in all India, the average number of inhabitants being 469 to the square mile, which exceeds that of England and Wales, or even Belgium. Besides Lucknow (q. v.), the capital, there are no large towns above 40,000, and consequently almost the whole population is agricultural. The Mohammedans number 10 per cent., including many of the higher classes; and the Hindus 89 per cent. The Brahmins, with 1,400,000, are by far the most numerous caste; the Rajputs are 662,000 in number. It was from these two high castes of O. that the Bengal sepoys were largely recruited before the Mutiny. O. forms one vast alluvial plain, with no mountains or minerals; the jungly hills to the N. were ceded to Nepal after the Mutiny. Besides the Ganges, the chief navigable streams are the Gumti, the Gogra, and the Rapti, which all flow S.E. towards the great river. According to a law of silt-laden rivers flowing through plains, they run on natural embankments 30 feet above the level of the country, which is thus divided into cup-like basins, forming marshes or *jheels*. Their inundations and the marshes supply irrigation; there are as yet no canals. The most formidable wild animal is the wolf; tigers only wander in from the Nepal terai. *Nilgai* ('blue cows') abound, and no Hindu will kill them. Of the total area, about 8,500,000 acres, or 56 per cent., are under plough cultivation. The crops are wheat, rice, and inferior food grains; sugar, oilseeds, tobacco, opium, and cotton. Most of these are largely exported by river and rail, to pay for the piece-goods, salt, and all sorts of manufactured articles which require to be imported. The large imports of Indian wheat into the United Kingdom, reaching 3,000,000 cwts. in 1876, chiefly come from this tract. The poor mainly subsist upon a mess of barley and pulse, and the rate of wages for unskilled labour is less than 3d. a day. Beyond a thriving weaving colony at Tanda, who import raw cotton largely, and manufactures of luxury at Lucknow, there are no manufactures throughout the provinces. The total imports are estimated at £1,650,000, the exports at £1,420,000. The administration was (prior to 1877) conducted by a chief commissioner resident at Lucknow, according to what is called the non-regulation system, under which the district officers, known as deputy-commissioners and not collectors, are not limited to members of the Covenanted Civil Service. The province is divided into 4 divisions, 12 districts, and 43 subdivisions. In 1875-76 the total imperial revenue was £1,668,000, of which £1,407,000 was derived from the land; in addition, the provincial and local revenue amounted to £452,000. In the expenditure an important item is £160,000, paid to various persons, on account of political pensions, not including £120,000 a year allowed to the ex-king of O. at Calcutta. The total military force is about 8000 men of all ranks and arms of the service, of whom more than half are Europeans, maintained at a total cost of £250,000. The regular and municipal police number 7700 officers and men, costing £107,000, apart from the *chowkeydars* or indigenous village watchmen. There were in 1875 altogether 1371 educational establishments, attended by 59,391 pupils; the total cost was £523,000. The chief of these is the Canning College, which has Oriental and law departments. Among charitable institutions are the King's Hospital, endowed by a former king of O. with £1454 a year; and the Bulrampur Hospital, built in 1871 by a wealthy *talukdar* at the cost of £10,000, and endowed with as much more. These are both at Lucknow. There are 1347 miles of water communication, 4225 miles of road, and at the end of 1876, 542 miles of the O. and Rohilcund Railway were open, mostly within the province, on which a capital of more than 5 millions had been expended; the net earnings were £122,581.

O. forms part of the great plain of Hindustan, and many of the earliest legends of the Hindus centre in this region. It was the birthplace of Sakhya Muni, the founder of Buddhism. But the separate history of the province only dates from 1756, when Shujah-ud-Dowla, the vizier of the Mogul emperor, established his independence of Delhi, under the title of Nawaub Vizier. In 1819 his descendant, Ghazi-ud-Din Hyder, was acknowledged by the British as king. The dealings of the British in Bengal with the dynasty were very intimate, chiefly taking the form of continual loans and cessions of territory. But the subsidiary force of the British was used to enforce daily the grossest acts of misgovernment, and in 1856 the last king, Wajid Ali Shah, who refused to sign a treaty parting with his sovereignty, was forcibly dethroned. Garden Reach, near Calcutta, was assigned to him as a residence, where he still lives, surrounded by a numerous circle of courtiers, on a pension of a *lac* of rupees a month (£120,000 a year). In the following year the Mutiny broke out, and both the *talukdars* or large landholders, who had been dispossessed, and the general population joined the mutinous sepoys. The British under Sir H. Lawrence (q. v.), and afterwards under Sir J. Outram (q. v.), were shut up in the Residency and the Alum Bagh of Lucknow for many months, and were only relieved at last by Sir Colin Campbell (Lord Clyde) in March 1857. The rebel leaders were the Moulvi of Fyzabad and the Begum or Queen of O., who finally escaped safely into Nepal. Lord Canning, the Governor-General, now passed his celebrated confiscation order, by which the proprietary right in the whole soil was resumed, to be afterwards granted away again on most favourable terms to the *talukdars*. Since January 17, 1877, O. has been amalgamated with the N.W. Provinces. See *Annual Blue-Books on the Moral and Material Progress of India* (Lond.), *Annual Administration Reports of the O. Government* (Lucknow), Sleeman's *Journey through the Kingdom of O.* (Lond. 1858).

Oude, the former capital both of the Hindu and Mohammedan kingdoms of the same name, now a ruined city in the British district of Fyzabad, on the right bank of the Gogra river, 75 miles E. of Lucknow; pop. (1869) 9949. It is considered by the best authorities to be the most ancient city in Hindustan, having been founded by Menu 2000 years B.C. O. was the birthplace and capital of Rama, the mythical hero of the *Ramayana*, from whom all the Rajput princes claim to have sprung. Nothing is now left but large mounds of earth and brick, with which various legends are associated. The Hindu temples that exist are all modern, the ancient buildings having been destroyed by the Mohammedans, who removed the seat of government to the adjoining city of Fyzabad (q. v.) in 1730. See General Cunningham's *Ancient Geography of India* (Lond. 1874); and Goldstucker's *Sanskrit Dictionary*, art. Ayodhya.

Oude'narde, or **Audenarde** (Dut. 'old earth' or 'land'), a town of Belgium, province of E. Flanders, on the Scheldt, 16 miles S. of Ghent by rail. It has a fine Gothic town hall, and linen and cotton mills, chemical works and tanneries. Pop. (1873) 4835. Marlborough and Prince Eugene here gained a brilliant and decisive victory over the French, under the Duke of Burgundy and Marshal Villars, 11th July 1708.

Oudinot, Charles Nicolas, Duc de Reggio, was born at Bar-le-Duc, 25th April 1767, joined the army in his seventeenth year, distinguished himself in suppressing a local riot (1790), and two years later was appointed lieutenant-colonel of the third battalion of the Meuse Volunteers. He executed a brilliant movement (May 1794) as chief of brigade at Kayserslautern, and was promoted general; on the 6th of August he manoeuvred himself into Trier, where he got his leg broken. On the 18th October 1795 he was wounded in five places before Mannheim, and fell into the hands of the Austrians. He made the Swabian and Bavarian campaigns, and was wounded at Neuburg (September 1796); in 1799 he became general of division, and was wounded both at Wurmlös and Schwitz; in the same year he performed a dashing feat at the passage of the Minio, by which he captured a battery. In 1801 he received a sash of honour, and in 1805 the grand cross of the Legion of Honour, with the command, at Arras, of ten battalions of reserve. With these he earned fresh renown at Vienna, Hollabrunn (where he was again wounded), Austerlitz, Jena, and

Ostrolenka. He commanded the advance guard on the march to Friedland, and in 1808 was nominated governor of Erfurt. In the Austrian campaign of 1809 he received a gun-shot wound at Lobau, and after the battle of Wagram, in which he successfully engaged, he was created Marshal of France and Duc de Reggio. O. occupied the Hague in 1810, and administered the country; in 1812-14 he operated against the Russians and Austrians, and on Napoleon retiring to Elba attached himself to Louis XVIII., whom he never afterwards forsook. Honours were heaped upon him, and at his death in Paris, 13th September 1847, he was a peer of France, Grand Chancellor of the Legion of Honour, and governor of the Invalides.—**Charles Nicolas O., Duc de Reggio**, eldest son of the preceding, was born at Bar-le-Duc, 3d November 1791, entered the army, and became a lieutenant of hussars in 1809, took part in Masséna's campaigns in Portugal and Spain, and in the Russian campaign of 1812. He was wounded at Leipzig and Craonne, but his valour won him a colonelcy (April 1814). Like his father, he remained faithful to the Bourbons. O. was made *maréchal de camp* (1822), was charged with the reorganisation of the French cavalry (1824), served in Algeria (1835), entered on a political career in 1842, and in 1849 commanded the troops that the French Republic despatched to Italy to sustain the authority of the Pope against the Mazzinists and Garibaldians. His success was decisive. He pronounced against the *coup d'état* of the 2d of December, was seized and imprisoned for some days, and on his release withdrew into private life. O. died 7th July 1863. See De Persiis, *Vie de Général O., Duc de Reggio* (Par. 1866).

Ougrée, a town of Belgium, on the Maas, 3 miles S.S.W. of Liege, has extensive engineering works, a cannon foundry, flour and oil mills, &c. Pop. (1873) 5759.

OUNCE (Lat. *uncia*), in troy weight is the twelfth part of a pound, and is equivalent to 480 grains; in avoirdupois weight it is the sixteenth part of a pound, and is equal to 437½ grains troy.

OUNCE (*Leopardus uncia*), a species of *Feline Carnivora*, allied to the Leopard (q. v.) and found in Asia. Some zoologists regard it as the young form of the leopard or panther, but there appear to be good grounds for believing the animal to represent a well-marked variety if not a distinct species of *Felide*. The fur of the O. is coarser than that of the leopard, and the spots which diversify it are not nearly so well-defined as those of the latter animal. Its tail is also clumsier.

Ouarari See CURARINE.

Ouro Preto, capital of the province of Minas Geraes, Brazil, in a bleak mountain region 4000 feet above the sea, and 200 miles, or fifteen days' journey by mules N.N.W. of Rio Janeiro. Originally a mining settlement, it rapidly attained a high degree of prosperity, but of late years it has greatly declined in consequence of the almost complete exhaustion of its gold mines. Pop. 8500.

Ouse (like Axe, Exe, and Usk, a derivative of the Cymr. *wysg*, 'water'), the name of several English rivers, of which the following are the most important—(1) The Great O., rising in Brackley, Northamptonshire, 10 miles W. of Buckingham, and after a N.W. course through the counties of Buckingham, Bedford, Huntingdon, Cambridge, and Norfolk, falling into the Wash, near Lynn. It receives the Ouzel, Cam (q. v.), Lark, Little O., and Nar, and has a length of 140 miles, of which 25 are navigable for barges. (2) The Yorkshire O., formed by the confluence of the Ure and Swale at Aldborough, 15 miles N.W. of York, and flowing in a S.E. direction till it joins the Trent, the two streams forming the estuary of the Humber (q. v.). It receives the Wharfe, Aire, Don, and Derwent, and has a length of 60 miles from Boroughbridge, or 135 miles from the source.

of the Ure, being navigable as high as York (45 miles) for vessels of 150 tons. (3) The Sussex O., rising at Slaughtam, and, after a S. course of 28 miles, falling into the English Channel at Newhaven.

Ou'sel, a name given to various Insectorial birds, such as the ring O. (*Turdus torquatus*), which arrives in Britain in April, and is known by the collar of white encircling its neck. The water O. or dipper (*Cinclus aquaticus*) is allied to the ant thrushes, and is notable for its activity in swimming, and more so for its diving habits, which are practised by the young dipper immediately on leaving the egg. The water O. is of a brown colour above; the throat and chest are white, and the abdomen a rusty red. The average length is 7 inches.

Ouseley, The Rev. Sir Frederick Arthur Gore, Bart., an English musician, was born in London, August 12, 1825, and educated at Christ Church, Oxford, after which he entered holy orders. He succeeded his father, the late Right Hon. Sir Gore Ouseley, as second baronet in 1844. In 1855 he was elected Professor of Music in the University of Oxford, and received the Precentorship of Hertford. He is incumbent of St. Michael's, Tenbury, and founder of a college in that parish for the instruction of boys in classics and choral singing. The following standard musical treatises are from his pen:—*On Harmony* (1869); *On Counterpoint and Fugue* (1869); *On Musical Form and General Composition* (1875). He has also edited several collections of church music, and has composed a number of excellent anthems and sacred pieces. His oratorio of *Hagar* was first performed at the Hereford Festival in 1873.

Oustiti. See MARMOSET.

Out'crop, in Geology, is the line along which an inclined stratum appears at the surface. The strike is the direction of this line, and is coincident with it when the surface is plane. The dip is at right angles to the strike. See DIP AND STRIKE.

Outer House. See COURT OF SESSION.

Out'fit Allowances in the British Army are granted to non-commissioned officers on obtaining regular commissions, to the extent of £100 in infantry, and £150 in cavalry regiments.

Out'lawry, in English law, means the exclusion of one from the protection of the law. The penalty is incurred by the wilful avoidance of legal process. In England, in cases of treason and felony, the law interprets the party's absence as proof of his guilt. In civil cases, O. renders a man incapable of suing for redress of injury.

Out'posts, the soldiers charged with the defence of the advanced positions of an army. See Colonel J. Jebb's *Practical Treatise on Strengthening and Defending O., &c.* (Lond. 1848).

Ou'tram, Sir James, G.O.B., G.C.S.I., a hero of the Indian Mutiny, and one of the most honoured characters in the army of the East India Company, was born at Butterley Hall in Derbyshire, January 29, 1803. His mother was of a Scotch family, and he was brought up in Scotland, studied at Marischal College, Aberdeen, and went out to Bombay as an infantry cadet in 1819. His chief services were in the political department, half diplomatic half administrative. He was first employed in introducing order among the wild hill tribes of the Bombay Presidency, then as *aide-de-camp* in the disastrous Afghan expedition of 1839, and afterwards as Resident at the Courts of Hyderabad, Sattara, and Baroda. It was while O. was at Hyderabad that the annexation of Scinde was effected, greatly against his advice, and he was besieged in the Residency. In 1856 he was selected by Lord Dalhousie to announce to the King of Oude his deposition, and to be the first Commissioner of that province. He conducted successfully the short Persian War of 1856–57, and reached Calcutta in time to help in suppressing the Mutiny. Though the superior commanding officer, he chivalrously consented to serve under Havelock as a volunteer in the force that relieved Lucknow; and after the final succour brought by Lord Clyde, resumed his duties as Civil Commissioner of Oude. O. received the thanks of Parliament, and was made a member of the Supreme Council of India, but retired in broken health in 1861. He died at Paris, 11th March 1863, was buried in Westminster Abbey; and has left a name as 'the Bayard of India,' and the friend of the people and native chiefs. Statues have been erected to his honour on the Thames Embankment, London, and at Calcutta.

Out'rigger is a name given to a long racing-boat having fixed to the wale and projecting outside of it an iron framework to support the rowlocks. This contrivance enables the boat to be made very narrow and light, while it gives increased leverage in manipulating the sculls. The framework itself is also called an O., and when applied to gigs they are termed *outrigged gigs*. On shipboard, O. is a general name for a spar or boom rigged out for various purposes, as from a ship's side to suspend boats, or from the crosstrees or top to extend the top-gallant breast backstays.

Out'works, the defences constructed beyond the *enceinte* of a fortress, such as ravelins, lunettes, counterguards, tenailles, &c. See FORTIFICATION.

Ou'zel. See OUSEL.

O'val (from Lat. *ovum*, 'an egg'), a general name given to any plane curve which resembles the longitudinal section of an egg. The ellipse is the simplest and most familiar example. The Cartesian and Cassinian ovals, so called from having been first investigated by Descartes and Cassini respectively, are curves of the fourth order. The former are physically interesting as being the plane sections of the equipotential surfaces due to two oppositely electrified or magnetised points. For a particular case, that of zero potential, the ovals which are at first in pairs reduce to circles. For a particular value of the potential, the ovals join to form one curve enclosing the two points, which approaches more and more nearly a circle as we recede from the electrified centres.

Ovamp'os, a race inhabiting S.W. Africa between the Cuanene river and the parallel of 21° S. lat. They are tall, muscular, and very dark, and seem to form a connecting link between the Kaffir and Negro races. Their language is without clicks, and they are more civilised than the tribes intervening between them and Cape Colony, having a king, inhabiting villages, and practising agriculture and various industrial arts. Cattle, ivory, ostrich feathers, and slaves are the chief articles of trade. On the S. border of their territory and partly mixed up with them are the Damaras, a Kaffir people whose language is intelligible to the O., and the Hill Damaras, a Negro race speaking the Namaqua language. Ovampoland consists of a tableland 6000 feet above the sea level, broken up to the S. by rugged peaks and barren hills, but declining to the N. into fertile plains, on which are grown large crops of maize and Kaffir corn. To the E. and S.E. it merges into the flat region near Lake Ngami and the Kalahari Desert. On the W. the plateau is divided from the sea by a sandy region from 50 to 100 miles wide, barren, rainless, and fever-stricken. The streams of Ovampoland are few and periodical, being absorbed in the sand in the dry season. The interior plains abound in lions, elephants, rhinoceroses, giraffes, antelopes, &c., which have retired northwards before the advance of civilised man.

O'var, a town of Portugal, province of Beira, at the mouth of a river of the same name, and on the lagoon of Ria d'Aveiro. It has a good trade and valuable fisheries. Pop. 10,374.

O'varies, the essential organs of the female generative system in animals, in which the *ova* or eggs are formed and matured. The ovary of the female corresponds to the *testis* in the male. The essential act of sexual reproduction consists in the contact of the fluid of the male (*seminal fluid*) with its contained spermatozooids with the ovum of the female. The act of contact constitutes fertilisation, and the result of this process is the initiation of those changes mentioned in the article DEVELOPMENT, and which culminate in the production of a new being. In the human female, the *ovaries* are two oval bodies which lie one on each side of the *uterus* or womb. The ovary of each side is contained within the *broad ligament* of the uterus, and lies behind and below the *Fallopian tube* or *oviduct* of its side. By its front margin the ovary is connected with the broad ligament, while by its inner margin it is attached to the uterus by its own or *ovarian ligament*. It is also attached to the fimbriated mouth of the Fallopian tube by a ligament of small size. The O. are of whitish colour, and may be either smooth or rough on their outer surface. In length they measure 1½ inches in the adult subject, about ¾ of an inch in width, and about ½ of an inch in thickness. They each weigh from 1 to 2 drachms. The O. are covered by the *Peritonæum* (q. v.). Each ovary has its

substance composed of fibrous tissue or *stroma*, the tough outer layer being named the *tunica albuginea*. Within the meshes of the fibrous network or *stroma* small vesicles are to be discerned. These are the *ovisacs* or *Graafian vesicles*, and contain the ova. In subjects who have not borne children, the ovisacs vary in number from fifteen to twenty, their size averaging that of a pin's head, but occasionally attaining to that of a pea. In their early development the Graafian vesicles are small, but when they ripen they approach the surface of the ovary, and form projections on its surface beneath the peritoneal covering of the organ. The Graafian vesicles continue to be formed from infancy to the end of the child-bearing period. Before puberty they are small and insignificant, and never attain any great degree of development. But after puberty, when *menstruation* occurs, the vesicles become matured and discharge their ova at the menstrual periods. Hence menstruation is the sign of the deeper work of *ovulation* or the production and maturation of ova. When the Graafian vesicle bursts, the ovum is liberated on the surface of the ovary, and is grasped by the fimbriated mouth of the Fallopian tube, through which the ovum is conveyed to the uterus or womb, where meeting with the seminal fluid of the male it becomes fertilised. Fertilisation may, however, take place in the Fallopian tube itself.

When an ovum is discharged from its *Graafian follicle*, there is left a small cavity which becomes filled with blood, and the margin of the vesicle becomes lined with a yellow substance, consisting probably of blood which has undergone chemical alteration and change. This appearance is known as the *corpus luteum*. It exists after the discharge of an ovum, but the *corpus luteum* which forms in the ovary after impregnation of an ovum, and that which results from the discharge of an ovum which has not been fertilised, are widely different in nature. The latter is smaller than the *corpus luteum* of pregnancy, and at the end of six months has disappeared, whilst the *corpus luteum* of pregnancy is as large as before. The *ligaments of the ovary* are the *ovarian ligament*, already mentioned, and the *round ligaments*. The arteries of the O. are derived from the aorta, and nerves originate from the *spermatic plexus*.

Diseases of the O.—The ovaries are liable to become the seat of tumours of all kinds, and those which are solid may be fibroid or malignant. *Fibroid* tumours of the ovaries are difficult to distinguish, during life, from fibroid tumours of the uterus, which are sometimes pedunculated and attain a very large size. They are distinguished from *malignant* tumours by the absence of the cancerous cachexia, and by their being of slower growth. Surgical interference, in the case of solid tumours, is inadvisable. The class of tumours with which surgeons are more immediately concerned are the cystic, which may be serous, colloid, or dermal. *Serous cysts* may be unilocular or multilocular, and the former are occasionally situated not in the ovary itself but in the broad ligament, and originate in degeneration of the Wolffian body or of the duct of Müller. *Cystic tumours* of the O. may be simple, single cysts, or proliferous; and the latter may be merely multilocular cysts or with a solid intracystic growth of a sarcomatous nature. Other compound cysts contain *colloid* matter; and *dermoid* cysts, which are congenital, contain masses of hair, portions of skin, and sometimes irregular pieces of bone, mixed often with a large quantity of fat. The fluid contained in cysts of the broad ligament is watery, like that of hydrocele; but true cysts of the O. contain a fluid rich in albumen, a good deal of cholesterine, and is generally like thick gum. Sometimes the contents are seropurulent or pure pus.

The gradual growth of an ovarian cyst produces the disease called *ovarian dropsy*, which may prove fatal from wasting, in consequence of the loss of albuminous matter in the cyst, from the effects of its size and pressure, or from its bursting into the peritoneal cavity. In some cases the secretion of fluid may cease and reabsorption may take place; or it may be reabsorbed from the peritoneum after it has burst into the peritoneal cavity. Suppuration will almost inevitably lead to ulceration and death.

Dropsy of the ovaries may be mistaken for peritoneal dropsy, for a softened fibroid tumour of the uterus, for large cysts in the kidney, for pregnancy, for tumours of the omentum, and even for phantom tumours. Diagnosis may be established by the history of the case, the constitutional symptoms, the physical examination of the abdomen, by exploration from the vagina or from the rectum, and in cases of doubt by tapping the tumour.

There are only two methods of treating dropsy of the ovaries, viz., tapping and excision or ovariectomy. Many surgeons recommend that ovariectomy should not be performed except after a preliminary and experimental tapping; but repeated tapping is by no means devoid of danger, and in the case of young healthy women the operation of excision is preferable. The success of this formidable operation of late years has been very encouraging, the ratio of mortality not exceeding a quarter, and even this ratio may be diminished by antiseptic appliances. In this operation the minutest precautions must be taken that every instrument, sponge, or other thing that touches the patient, and also the hands of the surgeon and his assistants should have been steeped in solution of carbolic acid. The operation should be performed under the carbolic acid spray. See Paper by Mr. Spencer Wells in *Med. Chir. Trans.*, vol. lvi. p. 120.

Ovariectomy. See *Ovaries, Diseases of*.

Ovary, in Botany, is the part of the Pistil (q. v.) that contains the Ovules (q. v.).

Ovation. See TRIUMPH.

Oven (Old Eng. and Ger. *ofen*), an arched brick chamber capable of being raised to a high temperature for the baking of bread, also used in the arts of metallurgy, in glass-making, and the manufacture of pottery. The name is also applied to many kinds of apparatus placed on or near a fire for general purposes of cooking. Domestic ovens are of three kinds—the ordinary range or stove O., the Dutch O., and the out-O. The Dutch O. is simply a closed metal vessel or pot placed on the hearth and surrounded by burning faggots. Many ingenious and successful modifications of it have been devised, suitable, on account of portability, alike for the army and navy, new settlers, or kitchen use. Hebert's domestic O., patented 1836, is extremely useful for baking or roasting on a small scale. The patented cooking apparatus of Captain Warren is now held in great esteem for barracks, shipboard, workhouses, &c., and it, together with Perkins' military portable steam-O., provides the British soldier with better cooked food than can be obtained in any Continental army. The out-O., now old-fashioned, is an arched brick cell, closed by an iron door, constructed *outside* a dwelling. The chamber is heated by burning faggots on the tiled floor, and after sweeping out the ashes, the bread or other food is introduced and baked or cooked by radiation of heat from the bricks. *Bakers' ovens* were for a long time constructed and heated on the same principle, which is obviously wasteful of fuel, but within the present generation immense improvements have been introduced, by which economy of fuel, cleanliness, and uniform distribution of heat are secured. There is now a great diversity in the shape and materials of construction, and modes of heating bakers' ovens. Some are circular or annular, others tubular, iron in some instances has superseded bricks, and hot water, gas, steam, and hot air are also in favour for heating. Charging and discharging the ovens are also effected mechanically, and in 'travelling ovens' the goods are placed on travelling platforms or shelves, and are baked in one passage through or round the cell.

Oven Bird (*Furnarius fuliginosus*), a species of Insectorial birds, so named from the peculiar shape of their nests, which are constructed in the form of a dome, the walls being fully an inch in thickness. The nest is formed of clay, grass, and vegetable fibres, packed so as to form a thick dense structure, which is usually placed in some exposed situation. These birds lay four eggs, and both sexes appear to assist in the formation of the nest. The plumage of these birds is of sombre colour. They inhabit S. America.

Ovens, an important gold-mining and agricultural district in the N.E. of Victoria, the principal towns in it being Beechworth (q. v.) and Wangaratta. It is drained by the O. river, a tributary of the Murray, and traversed by the railway from Melbourne to Albury, intended ultimately to connect the former place with Sydney.

Overbeck, Friedrich, a German historical painter, born 3d July 1789 at Lilbeck, studied in Vienna under Füger, and removed in 1810 to Rome, where he remained till his death, 12th November 1869. The influence of his early training under the Romantic School in Germany led O. to devote himself at Rome chiefly to the study of the pre-Raphaelite masters, in

whom he found the expression of piety and love that best harmonised with his own nature. He and his friends strove by imitation to catch the spirit of the old art, but often failed through a certain stiffness of drawing and poorness of colour. His becoming a Catholic was consistent with his artistic mode of thought. 'Christ's entry into Jerusalem' in the Marienkirche at Lübeck, the frescoes in the Villa Massimi at Rome (scenes from *Orlando Furioso*), 'St. Francis at Assisi,' also a fresco; 'The Influence of Religion upon Art,' an oil painting at Frankfurt, and the 'Ascension of the Madonna,' in the Cathedral of Köln, are O.'s best known works. One of his latest paintings, 'The Seven Sacraments,' distinguished by a wonderful fineness and purity of form, is scarcely reconcilable with his mystic symbolism.—**Johann Adolf O.**, nephew of the preceding, was born at Antwerp in 1826, and since 1858 has been Professor of Archæology at Leipsic. He is a valued art historian and critic. Among his writings are *Die Antiken Schriftquellen zur Geschichte der bildenden Künste bei den Griechen* (1868), and *Griechische Kunstmythologie* (1871).

Overbury, Sir Thomas, an English author and courtier, son of Nicholas O., a Gloucestershire gentleman, was born at Compton Scorfen, Warwickshire, in 1581, studied at Queen's College, Oxford, and shortly afterwards proceeded to the Continent, whence he returned with the reputation of an accomplished gentleman. In 1601 he paid a visit to Scotland, and while there formed an intimacy with Robert Carr, afterwards Viscount Rochester and Earl of Somerset, who was then page to the Earl of Dunbar, and who accompanied O. on his return to London. Carr, handsome, ambitious, and unscrupulous, soon became a favourite with King James, was created viscount, and obtained in 1608 a knighthood for his friend. Events soon occurred, however, which broke up the intimacy between O. and his patron, and brought about that tragedy which has given such a strange interest to the former. O. had been induced to aid Rochester in his guilty intrigues with Frances Howard, the beautiful though dissolute Countess of Essex; but on learning from the Viscount that it was his intention to get her divorced and then to marry her, he endeavoured to dissuade him from the design of forming a regular alliance with a woman of such notorious character. Rochester, ill-pleased at such counsel, mischievously imparted it to Lady Essex, who was much incensed, and immediately set about planning the ruin of her paramour's adviser. In this she was assisted by Rochester himself and the Earl of Northumberland, who was privy to their intrigue. It was determined to get rid of O. by poison, but as this was difficult so long as he was at liberty, Rochester laid a scheme to irritate the king against him. An ambassador to the French Court being required about this time, he advised the appointment of O. to this post, at the same time privately advising the latter not to accept it. O. having accordingly sent in his refusal, was by the king's orders thrown into the Tower, 21st April 1613. Here he was kept in close confinement. On the 15th of September he died of poison administered to him by Rochester's commands. Twelve years afterwards the whole plot was discovered, and several persons convicted of having taken part in the murder were executed. Rochester, now become the Earl of Somerset, and his guilty wife were condemned to death in 1616; but the king, by the exercise of a criminal clemency, changed their sentence into one of banishment from the Court. The only one of O.'s works which appeared during his lifetime was *A Wife now a Widow* (2d ed. Lond. 1614, printed along with his *Characters*). The felicity of the sketches in these *Characters*, or *Witty Descriptions of the Properties of Sundry Persons*, is at times not to be surpassed. Their quaint conceits, sweet fancies, epigrammatic daintiness, and rich flavour of poetic feeling, give them an enduring charm. 'The fair and happy milkmaid' is an idyll in prose that has no rival in English verse. Among O.'s other productions are *The First and Second Part of the Kemeddy of Love* (*ibid.*, 1620); *Observations on the Seventeen Provinces* (*ibid.*, 1626–51); *Crumm's Fallen from King James' Table or Table Talk* (*ibid.*, 1715). The latest edition of O.'s complete works was issued in 1856.

O'over Darwen, a manufacturing town of England, in Lancashire, 3½ miles S. of Blackburn by rail, has four churches and numerous schools and dissenting chapels, a theatre opened in 1877, club-rooms, a market-house, free library, temperance hall, public baths, washhouses, &c. There are bleaching and print

works, very extensive cotton and paper mills, and paper-staining establishments, and in the township are collieries and stone-quarries. O. D. was governed by a Local Board of Health till 1878, when it received a charter of incorporation as a borough. Pop. (1871) 21,278; estimated (1878) at 30,000.

O'verland Route is the name given to the most direct route from England to India, namely, that by rail *viâ* Calais, Paris, Lyons, Mont Cenis, Turin, Bologna, and Ancona or Brindisi, thence by steamer to Alexandria, by rail to Suez, and again by steamer through the Red Sea and Indian Ocean to Bombay. The passage may be made by the Peninsular and Oriental Steam Company's line in twenty-one days (contract time); sometimes in nineteen days; and the through fare is £170 second class, and £300 first class. The French Messageries steamers sail from Marseille direct *viâ* Port Said, Suez, and Aden to Bombay. The sea route by the Cape of Good Hope, though considerably cheaper, is not accomplished in less than 94 days by steamers, while sailing vessels take four months. The name was first used by those enterprising travellers who really travelled overland through Turkey and Persia, in the line of the Indo-European Telegraph and the proposed railway, but it has now become rather a misnomer.

O'verseers are officers annually appointed to determine the poor-rate in parishes of England and Wales, and to collect and apply it in giving relief to the poor. O. are chosen by two or more justices from among the resident householders paying the poor assessment. They must be substantial householders; which fact must be stated in appointing them. Doubts having arisen as to the coequal jurisdiction of city and burgh justices and county justices under 43 Eliz. c. 2, in certain matters relating to the poor, they are removed by 12 and 13 Vict. c. 64, enacting that all power which may be exercised out of general or quarter sessions by two or more county justices, may be exercised by two or more city or burgh justices, within their jurisdiction. 12 and 13 Vict. c. 103, enacts that no one is to be appointed an overseer who is directly or indirectly concerned in any contract for the supply of goods or provisions for the workhouse, or for the relief of the poor of the parish, or of the union which comprises it. The duties of O. are to raise, by rate on the inhabitants, the funds necessary to relieve the poor and to provide material for giving them work; to apprentice poor children, and to set to work all persons, married or unmarried, who have no means of maintaining themselves. O., in granting relief to the poor, are entirely under the direction of the guardians, vestry, or other governing authority. They have no discretionary power in granting relief, except in an emergency, and in no case are they entitled to grant money. Persons threatening to run away, and have their families chargeable on the rates, or refusing to work and maintain them, being able to do so, may be committed to the house of correction. When a family is left chargeable, the O. may seize, by order of the justices, so much of the means of the father as will maintain them. The husband is liable for all relief given to his wife, or to his children under sixteen; and such relief may be considered a *loan*, for which the wages of the party may be attached in the hands of his employer. Books must be kept open for the inspection of the parishioners, in which shall be registered the names of persons receiving relief, the time when they were first admitted, and the cause of their requiring relief. Under 6 Vict. c. 18, the O. having received printed forms on or before the 10th of June from the clerks of the peace, must give notice on or before the 20th June, requiring all persons entitled to vote for a county member, and who are not already on the register, or who have changed their qualification or residence, to send their names in a prescribed form, with a claim to be placed on the register, to the overseer, on or before the following 20th July. Lists of claimants are to be delivered to the clerk of the peace before the 29th of August, with the comments of the overseer, when required. An overseer wilfully contravening any provision of the Reform Act is liable to a penalty of £500. In Scotland, inspectors of the poor are appointed under the Poor Law Amendment Act. See POOR LAWS.

O'verstone, Samuel Jones Loyd, Baron, born September 25, 1796, passed from Eton to Trinity College, Cambridge, and succeeded his father Lewis Loyd as head of the London banking-house of Jones, Loyd & Co., originated in

Manchester. He sat as Liberal member for Hythe (1819-26), was defeated for Manchester (1832), served as High Sheriff of Warwickshire (1838), and was raised to the peerage (1850). A munificent art-patron, he is best known as an authority on the decimal coinage and other financial questions, on which he has published various important treatises. He warmly advocated the Bank Charter Act (1844), in a series of letters to the *Times* signed 'Mercator,' and as warmly opposed the Limited Liability Act (1856). See Grindon's *Manchester Banks and Bankers: Historical, Biographical, and Anecdotal* (Manch. 1877).

Overture (Ital. *overtura*; Fr. *ouverture*, lit. 'an opening') an introductory orchestral movement prefixed to an opera or oratorio. Most old overtures were founded on two models, that of Lully (French) and Scarlatti (Italian). The first (adopted by Handel among other composers) usually opened with a slow movement, followed by free imitation, reverted to a 'grave,' and concluded with a spirited passage. The second had three movements, the first and third being vigorous and lively, the middle slow. The modern overture, taking its leading themes from the work which follows, foreshadows its dramatic incidents. Fine examples of this style are the overtures to *Fidelio* (Beethoven), *Der Freischütz* (Weber), *William Tell* (Rossini), *Fra Diavolo* (Auber), *Zampa* (Herold), and *Tannhäuser* (Wagner). The concert overture is a complete work in itself, and is akin to the first movement of a symphony. Mendelssohn's *Isles of Fingal* and Sterndale-Bennett's *Niäades* belong to this class.

Overture, a Scotch ecclesiastical term, means a proposal brought forward by a member of a church court, to be, if approved in that court, submitted to the supreme court, with the view of amending, defining, enforcing, or repealing any existing law, or enacting a new law, on matters which are within the legislative or executive functions of the Church. In terms of the Barrier Act (1697), no new law can be enacted by the General Assembly of the Church of Scotland, nor can an existing one be rescinded, without the consent of a majority of the Presbyteries. Hence an O. may also be transmitted by the Supreme Court to the Presbyteries in order to elicit their opinions on the matter in question. See Cook's *Styles*, &c. (Edin. 4th ed. 1870).

Overijssel ('over,' or 'beyond the Yssel'), a province of Holland, lying between the Zuider Zee on the W. and Hannover and Westphalia, and bounded S. by Gelderland, and N. by Friesland and Drenthe. Area, 283 sq. miles; pop. (1876) 265,144. The Yssel, the northern branch of the Rhine, mainly forms the western boundary, and the rest of the province is watered by the Vecht, Regge, and IJaveler Aa, which, after joining the Zwart Water, enters the Zuider Zee by the Zwolsche Diep. Along the Yssel are produced good crops of rye, barley, oats, hemp, buckwheat, and potatoes. Throughout the rest of O. the soil is for the most part sandy and unproductive. There are considerable stretches of heath, and from N. to S. the province is traversed by a broken chain of low sandhills. The chief occupations are cattle-rearing, peat-digging, and the manufacturing of cottons and linens. The capital is Zwolle.

Ovidius Naso, Publius, one of the greatest and most charming of the Latin poets, was born at Sulmo in the country of the Peligni, 20th March 43 B.C. He was descended from an old equestrian family of moderate means, and he, along with his brother Lucius, his senior by exactly a year, — 'a double birthday offering kept the day,' — was destined for the bar, and under Arellius Fuscus and Porcius Latro received a careful training with a view to entering on professional life. Though enjoying a high reputation as a declaimer, the practical bent of O. was irrepressible, and instead of studying jurisprudence or frequenting the noisy forum, like Pope, 'he lapsed in numbers for the numbers came.' His brother Lucius died immediately after completing his 20th year, and the family property, which no longer required to be divided, enabled him to repair to Athens for the completion of his education. There he acquired a perfect mastery of the Greek language. His sojourn at Athens was interrupted or followed by a tour made in company with the poet Macer. This tour included the famous cities of Western Asia Minor and Sicily. On his return to Rome O. did not give up the prospect of a public career.

He was made one of the *Triumviri Capitales*, a singularly incongruous post for a poet to fill, since the duties corresponded pretty nearly with those of our police magistrates and undersheriffs. Thereafter he became one of the *Centumviri*, and eventually one of the *Dacemviri*. The last office entitled him to a seat in the Theatre distinguished above that of the other Equites. O. had now definitely to decide whether he would follow a public life. He was eligible for the Quæstorship, but declined to become a candidate. He accordingly exchanged the broad purple stripe of a possible senator for the narrower one of his hereditary rank of knight, and entered upon the life of a private gentleman. O. from an early age seems to have evinced a levity of disposition and a marked inclination towards gallantry. These symptoms may have induced his parents, who seem to have been people of staid character, to provide a wife for their son while he was still very young. The union proved a most unfortunate one, and the lady was speedily divorced. A second wife was soon found for young O. and as speedily discarded. The poet's affections had indeed long ere this been given to Corinna, who is believed to have been no other than Julia, the clever but dissolute daughter of Augustus. Probably about his 30th year O. married his third wife, by whom he became the father of Perilla, and whom he invariably mentions with great tenderness and affection. O. mixed in the best society in Rome, and numbered among his literary friends the poets Æmilius Macer, Propertius, Ponticus, Bassus, and Horace. At the age of fifty, by an edict of Augustus, he was banished to Tomi, a town on the borders of the Euxine. The edict condemned him to a *relegatio*, not an *exilium*, i.e., he was allowed to retain his citizenship and property. The sole ground of his banishment stated in the edict was the publication of his *Art of Love*. O. himself says it was due to *Carmen et Error*. The *Carmen* was a mere pretext, for the *Ars Amatoria* had been in circulation for ten years; the *error*, whatever that might be, was the real cause. Though O. has most closely kept the secret from the world, probably from the notion that his divulging it would lessen if not entirely dissipate his chances of recall, he unmistakably points to something seen by, or well known to, him involving the disgrace of the imperial family.

The common opinion, or rather suspicion, is that O. was an accomplice in the adultery of Julia, the grand-daughter of Augustus, with D. Silanus. Be that as it may, O. left Rome for Tomi in the autumn of 9 A.D. His whole life hitherto had been spent in Rome in the society of the polished, the brilliant, and the gay, in a sort of magic circle in which culture and mirth met and lived in amity; in short, the distinguished *coterie* in which he moved and breathed included the imperial family. Banishment to a foreign and barbarous clime, therefore, could not prove otherwise than fatal to his gentle and effeminate nature; and after a long series of piteous and humiliating letters written to friends at Rome, but to no purpose, the gifted poet died, revered, at Tomi, A.D. 17. His wife remained true to him to the last. The works of O. appeared in the following order:—*Amorum Libri III.*, *Epistola Heroidum*, *Ars Amatoria*, *Remedia Amoris*, *Nux*, *Metamorphoseon Libri XV.*, *Fastorum Libri XII.* (the first six only remain), *Tristium Libri V.*, *Epistolarum ex Ponto Libri IV.*, *Ibis*, *Consolatio ad Liviam Augustam* (held spurious by some critics), *Medicamina Faciei*, and *Haliuticon* (genuineness uncertain). O.'s tragedy entitled *Medea*, and other of his works have perished.

Ovid's genius has always commanded the admiration of scholars. His vigorous fancy and exquisite pathos, richness of imagery, intensely sensuous expression, and his vast mythological and antiquarian lore, combined with the tuneful melody and bell-like recurrent chime of his verse, have made him a favourite with all modern poets, and won for him from Niebuhr the high praise of being, next to Catullus, the most poetical of the Roman poets.

The *Editio Princeps* of O. was published at Bologna (1471, 2 vols. fol.); also one at Rome, same year; *Aldine* (1502, 3 vols. 8vo); *Elsevir* (Leyden, 1629); *Burmman* (Amst. 1727). Of modern editions containing the complete works that by R. Merkel (Leips. 1853, 3 vols.) is the best. Though *Ovid* has been done into most of the European tongues in whole or in part, there is no good translation of the works by a single hand. The versions of portions of the *Metamorphoses* by Dryden, Addison, Cowper, and others are fair; a number of pieces from the same poem by Professor D'Arcy Wentworth Thompson are most fel-

citously rendered, but the translation of the whole work in blank verse by Mr. Henry King (Edin. Blackwood, 1871) is by far the best yet offered to the English public.

Oviduct, the name given to the canal leading from the Ovary (q. v.) of animals to the uterus, or to the external surface of the body, and through which the eggs or ova are conveyed. In *Mammalia* the oviducts are named 'Fallopian tubes,' after the anatomist Fallopius, who first described them.

Ovie'do, a town of Spain, capital of the principality of Asturias, in a fertile plain between the rivers Nalon and Nora, 748 feet above the sea, and 26 miles S.S.W. of the seaport of Gijon by rail. O. is a well-built town, with wide streets and promenades (*alamedas*), and a beautiful Gothic cathedral, founded in 760 by Froila, son of Pelayo (q. v.). It has a fine library and theatre, and is the seat of a bishop and of a university (founded 1850). Over 4000 workmen are here employed by the Government or by private persons in the iron manufacture, 20,400 tons of cast-iron, and 5000 of bar-iron being annually produced. The royal gun-factory at O., with over 500 workmen, makes every year from 600 to 1500 muskets. 12 miles W. of O., at the confluence of the Nalon and Trubia, is the royal iron foundry and manufactory of Trubia (established 1844), employing 1200 men, and annually producing 365 cannon of 3 to 4½ tons' weight, besides 12,000 rifles and carbines, as many bayonets, 900 revolvers, and 36,000 files. Pop. 14,156.

Ovie'do y Valdez, Gonzalo Fernandez de, was born at Madrid in 1478, and as page to Prince Juan of Castile witnessed the closing campaigns of the Moorish War (1490-92). In 1514 he sailed for the New World, with the appointment of inspector of mines, and later he became alcaide of Hispaniola, and historiographer of the Indies. O. died at Valladolid in Spain, in 1557. His *Sumario* (1526) was followed by the fuller *Historia General y Natural de las Indias Occidentales*, in 50 books, 21 only of which were printed at Seville in 1535, the first complete edition being published by the Real Academia Española (4 vols. 1850). He also wrote an *Historia de Nicaragua*, several Spanish chronicles, and *Las Quinquagenas*, fifty dialogues on the men and manners of the age, which, still unpublished, is preserved in MS. at Madrid. See Ticknor's *History of Spanish Literature* (3 vols. 1849).

Oviparous, a name given to those animals that produce eggs which are afterwards hatched outside the parent-body; e.g., birds. *Ovo-viviparous* animals are those which produce eggs, but also retain the eggs within their bodies until such time as the young escape therefrom—the process of hatching being thus carried on within the parent-body. Some reptiles (e.g., vipers, and some lizards, viviparous lizard—*Zootoca vivipara*) are ovo-viviparous, as also are the land salamanders or land newts among the *Amphibia*.

Ovipositor, one of the appendages of the last abdominal segment of certain insects, used for the purpose of depositing the eggs in various situations. Other modifications of the terminal appendages form the 'sting' (*aculeus*) seen in bees, &c. The O. in all insects is formed on one and the same type. By the O. some insects (e.g., gall-flies), slit open the bark of trees, and deposit their eggs therein, while others use the organ to penetrate into the tissues of animals for the same purpose.

O'volo (Ital.; from Lat. *ovum*, 'an egg'), a convex moulding, generally a quadrant of a circle. In classic architecture it was invariably decorated with the 'egg and dart,' or other ornament. See **MOULDINGS**.

O'vo-Viviparous. See **OVIPAROUS**.

Ovule, in Botany, is the earliest condition of the future seeds. They are fixed to certain parts of the wall of the ovary termed the *Placenta* (q. v.), and are either *sessile* (as in the primrose), or attached to the end of a stalk or *funiculus* (as in the ash). Each O. when fully formed usually consists of a central mass or *nucleus* (with an internal large cell called the *embryo sac*) enclosed in two bag-like coats, the outer one called *primine*, the inner one *secundine*. The *chalaza* is the point of the O. at which the base of the nucleus is confluent with the coats. The *foramen* or *microphyle* is a minute aperture in the coats over the apex of the nucleus. Ovules are (1) *orthotropous* or *straight*, when the chalaza coincides with the base (i.e., the point of attachment) of the O.,

and the foramen is at the opposite extremity, the axis of the O. being straight (example, wall pellitory). (2.) *Campylotropous* or *incurved*, when the chalaza still coinciding with the base of O., the axis of the O. is curved, bringing down the foramen more or less towards that base (example, stock). (3.) *Anatropous* or *inverted*, when the chalaza is at the apex of the O., and the foramen next to its base, the axis remaining straight. In this, one of the most frequent forms of O., the chalaza is connected with the base by a cord, called *rhaphe*, adhering to one side of the O., and becoming more or less incorporated with its coats as the O. enlarges into a seed (example, dandelion). Between these three forms various intermediates occur, as for instance in what is called the *amphitropous* or *half-inverted*, when the O. being as it were attached laterally, the chalaza and foramen at opposite ends of its straight or curved axis are about equally distant from the base or point of attachment.

O'vum or **Egg**, the product of the *Ovary* (q. v.), or female organ of generation, which, when duly fertilised, is capable of developing into a new being. It may be said that Harvey's dictum *omne animal ex ovo* is in the main true, inasmuch as, while asexual methods of generation—e.g. Fission (q. v.), and Gemination (q. v.)—do exist, the sexual method of reproduction by ova or eggs ultimately comes into play in the history of all animals—even perhaps in the very lowest animals or *Protozoa*. The human ovum has a diameter of the $\frac{1}{100}$ th, or $\frac{1}{11}$ th of an inch. It is a minute mass of protoplasmic matter, and like all ova exhibits an outer covering—the *vittelline membrane* or *zona pellucida*. Within this membrane is contained the *vittellus* or *yolk*, and within the yolk-substance is found the *germinal vesicle*, and *germinal spot*, or *macula germinativa*. The germinal vesicle measures about the $\frac{1}{3}$ th of an inch in diameter, the germinal spot being about the $\frac{1}{100}$ th of an inch in breadth. The O. itself lies embedded within its *Graafian vesicle* (see **OVARY**), and within a mass of cells which collectively form the *membrana granulosa*. The germinal vesicle and germinal spot are the first formed parts of the O. While the parts or structures first mentioned are common to all ova, their relative degrees of development vary greatly in different groups of animals. The differences between ova chiefly consist in the development of the yolk as compared with other parts of the egg. In the egg of the hen, the germinal vesicle and germinal spot, representing the actual seat of the developmental changes, occupy a very limited portion of the O., which is largely made up of the yolk and other structures adapted for the nutrition of the developing embryo.

Owen, John, D.D., the famous Nonconformist divine, was the son of Henry Owen, vicar of Stadham, and was born in 1616. At the age of twelve he entered Queen's College, Oxford, where he studied with extraordinary diligence. He ultimately entered the Church, but his Puritan tendencies were so pronounced, and his opposition to the innovations of Laud so violent, that soon after obtaining holy orders he was forced to quit Oxford. Having for the same cause been disinherited by a rich uncle, who had maintained him at Oxford, and whose heir he was to have been, he removed to London. Here he attracted attention by the publication (1642) of his *Display of Arminianism*, and he was presented by one of the 'Committees for inquiry into the Scandalous Immoralities of the Clergy' to the living of Fordham in Essex. From this he soon removed to Coggeshall, and about this time his views underwent a change from Presbyterianism to Congregationalism. Meantime his fame as a preacher had grown. He preached before Parliament the day after the trial of King Charles, and afterwards accompanied Cromwell as chaplain to Ireland and Scotland. In 1651 he was made dean of Christ Church, Oxford, and vice-chancellor of the University, and in 1653 received the degree of D.D. He was a member of the new Parliament of 1654, and, beginning to suspect Cromwell's ambition, joined the officers who drew up the petition which is said to have scared the latter from accepting the crown. For this or some other reason, O. lost the favour of the Protector, and with that, soon after, his deanery and vice-chancellorship. After the Restoration O. retired to his native place, where, notwithstanding his legal disability according to the Act of Uniformity (1662), he continued to preach, as well as to write. He preached again to a congregation in London during the time that Charles' proclamation permitted the Nonconformists (q. v.), 'to perform their devo-

tions in their own way.' During the last years of his life he suffered much from ill-health. He died at the village of Ealing, 24th Aug. 1683. O. was a man of profound piety and great learning, whose influence on the age, by practical usefulness and by his writings, was great. Indeed, as a preacher and writer he was only second to Baxter and Howe. Of his multitudinous writings, the one which is of real, permanent value is his *Exposition of the Epistle to the Hebrews* (4 vols. fol., Lond. 1668-84), which is yet the most valuable exposition of that epistle ever published in this country. See Orme's *Memoirs of John O.* (Lond. 1820), *Works* (28 vols. 8vo, Lond. 1826, ed. Russell; 24 vols. 8vo, Edinb. 1850, ed. Gould).

Owen, Richard, O.B., F.R.S., a celebrated anatomist and biologist, was born at Lancaster, July 20, 1804. He studied at Edinburgh, became assistant physician in the Fleet in 1826, and in 1835 was appointed Hunterian Professor of Anatomy and Physiology and Conservator of the Museum in the Royal College of Surgeons, London. For several years previous he had been engaged in preparing catalogues of the specimens in this museum; and these catalogues are his first literary work. He took an active share in the organisation of the Great Exhibition of 1851, and also of the Paris Exhibition of 1855. In the latter year he entered upon new duties as superintendent of the Natural History Departments (Zoology, Geology, Mineralogy) in the British Museum, a position which he still holds. As a comparative anatomist, he stands among the foremost of his time; and has, indeed, been named 'the Cuvier of England.' He first drew attention to the disappearance within historic times of the *Dinornis* of New Zealand; and in 1855 propounded his theory of 'natural rejection,' by which, in virtue of the 'contest of existence,' certain genera, among which are the Aptornis, Notornis, Chemiornis, Dodo, &c., became extinct. In this, as also in his views regarding the evolution of species, he prepared the way for the wider and more thorough hypothesis of Darwin—the origin of species by natural selection. His works and memoirs are numerous. The principal are *Odontography* (2 vols. 1840-45), *Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals* (1843, 2d ed. 1855), and on the *Vertebrate Animals* (3 vols. 1846, 2d ed. 1866-68), *History of British Fossil Mammals and Birds* (1846), *On Parthenogenesis* (1849), *History of British Fossil Reptiles* (1849-51), *Palaeontology* (1860, 2d ed. 1869). He is a Fellow and Associate of most of the scientific societies at home and abroad, and was created a Companion of the Bath, June 3, 1873.

Owen, Robert, social philanthropist, was born at Newton, Montgomeryshire, May 14th, 1771, received a scanty education, and in his fourteenth year became an under-master in a school in his native place, and afterwards a draper at Stamford, London, and Manchester. In 1801 he married a daughter of David Dale, a cotton-millowner in the village of New Lanark on the Clyde. Upon the workers at the mills O. put into practice several social and educational theories. In his school he abolished all prizes and penalties, and to each family he endeavoured to give a larger space to live in, purified by proper sanitary arrangements. At the same time he carried on an extensive propaganda by means of lectures and pamphlets, having in view the universalising of his schemes. In 1812 appeared his *New Views of Society; or Essays on the Formation of the Human Character*. Having dropped his connection with New Lanark, O. made similar efforts in the United States, in the parish of Bothwell, Lanarkshire, in Hampshire, and in Mexico, but without realising his ideal in any of them. In 1848 he crossed to Paris, in order to seize the revolutionary opportunity with a view to gaining adherents, but he made no headway. He died at Newtown, November 19, 1858. O.'s character showed a curious mixture of practical sense and Utopianism: his entire singleness of purpose was a virtue beyond all praise. See Booth's *Life of O.* (Lond. 1869).—**Robert Dale O.**, eldest son of the preceding, born in 1801, assisted in founding the colony at New Harmony, was an active Democratic member of Congress, 1843-47, and United States Minister at Naples, 1855-58, took part in the abolition movement, and was the author of *System of Education at New Lanark* (1824), *Moral Physiology* (1831), *Personality of God*, and *Authenticity of the Bible* (1832), *Footfalls on the Boundary of Another World* (1860), *The Debatable Land between this World and the Next* (1872), and *Threading my Way, an Autobiography* (1874). He died 25th June 1877.

Owens College, Manchester, was founded in 1846 by John Owens, a Manchester merchant, who bequeathed £100,000 'for providing or aiding the means of instructing and improving young persons of the male sex (being of an age not less than fourteen years) in such branches of learning and science as were then, and might be thereafter, usually taught in English Universities.' It is in connection with the University of London, and holds yearly examinations for matriculation and the B.A. and B.Sc. degrees in that University. The Council is composed of 14 members, and the Senate of 20; and the number of professors and lecturers, exclusive of those in the medical department, is 32. O. C. was opened March 10, 1851; but the original edifice proving insufficient, new buildings have been erected, since 1870, by Mr. A. Waterhouse, at a cost of £120,000. They are in the Domestic Gothic style, in the form of a quadrangle, and include a chemical laboratory, medical school, and natural history museum. A scheme is now (1878) on foot, for the erection of O. C. into an independent university, with the power of granting degrees of its own.

Owl (from the 'hooting' or 'howling' sound made by the bird), the name given to the members of a well-defined family of *Raptorial* birds, forming the section of that order named *Nocturnal Raptores* from their habit of flying about by night. The family *Strigula*, or that of the O., is distinguished by a small bill. The beak is, however, much arched and acutely curved, and has its sides compressed. At the base a development of downy plumes is found, and the tip is hooked. The feathers of the O. are soft and downy, evidently adapted to the nocturnal habits of the bird, by enabling it to fly in a noiseless manner. The tarsi are feathered to the toes, and the talons are long and sharp. Several distinctly-marked sub-families are found within the limits of the *Strigula*. In the sub-family *Surnina*, the head is small and there are no 'ear-tufts,' while the circles of feathers (known as *facial discs*), which surround the eyes in some species are not represented. The genus *Surnia* has long pointed wings, of which the third is the longest. The tail is also long and wedge-shaped, and the tarsi and toes are short and feathered. This genus is represented in N. Europe and America. The general peculiarities and features of the structure of the O. may be well studied even in this first and by no means very typical genus. The eyes are very large, and the *nictitating membrane*, by means of which the surface of the eye is kept clear, is especially well-developed, and acts as a kind of curtain by means of which the light is modified. It is necessary to remark that although the O. is *nocturnal* in habit as a rule, its period of activity is by no means confined to the night. Some owls fly abroad during the day; others are active during twilight. To the genus *Surnia* belongs the Canada or Hawk O. (*S. ulula*) found in N. America, and which is a daylight-loving species. The male is smaller than the female; the food consists largely of game-birds, mice, and the smaller quadrupeds. The Hawk O. is brown above, and white below, and is spotted and barred with black or dark tints. The Snowy O. (*Nyctea nivea*) represents another genus of the sub-family *Surnina*. The wings are long, and the tail short and rounded. This bird inhabits N. Europe and N. America. It attains a length of from 22 to 27 inches, and is of pure white colour when full grown. The Burrowing O. (*Athene cunicularia*) is so named from its inhabiting burrows excavated in the American prairie-lands by the prairie-dogs; the quadruped and the bird living harmoniously as co-tenants of the burrow. The colour is a rich brown above, and a greyish-white below; and the average length is 11 inches. The *Athene convivia* of Australia is another example; while the Little O. of Britain is the *A. passerina* of ornithologists. It is common on the Continent, and is of a dark-brown colour, with yellow and white markings.

The members of the sub-family of the *Bubonina*, or eagle owls, have a large head, flattened on the top, whilst two feathery tufts or 'ears' are seen at the sides of the head, and the 'facial discs' are incomplete. To this sub-family belongs the genus *Ephialtes*, represented by the *E. Scops*, or scope-eared O., rare in England, but common in S. Europe and in some parts of Asia. It is a diminutive bird, measuring about 7½ inches in length, brown above and greyish-white below. The typical genus (*Bubo*) of this sub-family is that including the well-known eagle and great O. In this genus the wings are long and powerful, and the tail is rounded. The great O. (*Bubo maxi-*

mus) attains a length of 2 feet. It is of a brownish-yellow colour, with the usual variegation of black-brown spots and bars. The bird is common in N. Europe, and extends as far S. as Italy and Turkey. A typical American species is the Virginian Eared O. (*B. Virginianus*) which measures about 2 feet in length, and is very destructive to game birds of all kinds, as well as to poultry and small quadrupeds. Several genera are nearly allied to those included in the sub-family *Surnina*. Such are the genera *Surnium* (represented by the brown or tawny O. (*S. aluco*) of Britain, and *Otus*, represented by the long-eared O. (*Otus vulgaris*), also common in Britain. The tawny O. is

Tawny Owl.

about 15 inches long, and is ashy-grey above, variegated with dark brown; the facial disc being white. Two small tufts are borne on the head. Another species is the *S. Uralense*, or Ural O. of N. Europe. The long-eared O. is of a pale-brown above, the under parts being greyish-white. It occurs in Europe and Asia, and is also found in America. The short-eared O. (*Otus brachyotus*) has a small head. It is found in England, and also occurs in N. America, Asia, and Africa. Some very familiar species of O. belong to the sub-family *Strigina*. In this group there are no ear-tufts, and the 'facial discs' are complete. The bill is long and the wings are large, their second quills being the longest. The tail is short and the toes are long and hairy, the outer toe being shorter than the inner. Members of this sub-family of O. are distributed throughout the world. The White or Barn O. (*S. flammea*) only requires mention as a very familiar example of a British O. Its colour is a buff of varying tints, marked with grey, white, and black, the under parts being white. The young present a very curious appearance, and look like masses of white down. These birds are very prolific, and are said to feed one brood while sitting on the eggs of another.

Owl-glass. See EULENSPIEGEL.

Ox (Old Eng. *oxa*, Dan. *oxe*, Ger. *ochs*, Goth. *auhsa*, Sansk. *ukshan*), the name given to various breeds of ungulated or 'hoofed' quadrupeds, belonging to the *Ruminant* group and to the family *Bovidae*. In their dentition the oxen agree with their ruminant neighbours in having no upper incisor or canine teeth. The lower incisors number eight, and bite against a hardened pad of gum in front of the upper jaw. There are six molars on each side of each jaw. The two toes of each foot are hoofed and separated, while there are accessory or rudimentary toes on the hinder part of the feet. Oxen are distinguished as a family by the simple and rounded structure of their horns. No *lachrymal sinuses* or 'tear pits' exist. Being typical *ruminants* their digestive system exhibits the division into four compartments which characterises that group. Having been specially domesticated by man, the result has been the formation of very many breeds, races, or permanent varieties. The original stock from which the ordinary breeds have been derived it is, probably, impossible to trace. Whether the existing breeds are the descendants of more than one original or wild stock is a question perhaps equally insoluble. With the view of placing the chief facts relative to the wild races of cattle before the reader, we may briefly refer in the first instance to those members of the family *Bovidae* which may be regarded as most nearly approaching the wild or original stock.

The existing *Chillingham Cattle* form a breed which appears in a very striking manner to present traces of immediate wild descent. The Chillingham cattle are of a creamy white colour, the ears being reddish and the muzzle black. Allowed to roam at will through the domain of their owner, these cattle retain many of the habits of their wild state. They are bold and aggressive, and herd together under the command of a leader, whose authority is paramount. By good authorities the Chillingham cattle are believed to be the descendants of the so-called 'mountain bull' or *Urus*, an O. which was tolerably plentiful at the time of the Roman invasion. Those naturalists who

assign such an origin to the Chillingham breed, maintain that most of the smaller races of cattle have sprung from a species now extinct, and known as the British shorthorn (*Bos elongifrons*). Of wild cattle, somewhat removed from the ordinary type of existing oxen, the Aurochs or Lithuanian bison (*Bos bison*) is a good example. This animal is still found wild in the Caucasian forests. The 'humped' cattle of the East have probably originated from a widely different stock to that from which the common cattle have descended. The domestic O. is an animal used in many parts of the world, and in a very few districts of Britain as a beast of draught, being employed to draw the plough and in carts. The ordinary breeds of cattle are valued for the sake of the flesh and the hides; the breeder paying particular attention to the formation of a race which will be suitable for the purposes of the feeder and butcher. On the other hand, there are breeds of oxen which are specially valued for the richness and abundance of their milk. Such are the Ayrshire and Alderney oxen. In ordinary cattle the period of gestation or carrying the young is about 270 days, or nine months. The calf or young attains maturity in from two to three years, and becomes aged at periods varying from seven to ten years. In a state of nature oxen are gregarious; one bull, or male, mates with several females, or is polygamous. Oxen require large quantities of vegetable food, and subsist largely upon grasses, although their dietary in a domesticated state also includes a large number of substances intended to fatten them in the shortest possible time. Of the ordinary varieties or breeds of oxen, one of the best known is the *Shorthorn*, so named on account of the relatively small size of its horns. This breed was formed about the beginning of the present century in the N. of England, and shows a hardy race of animals, readily fattened, and when crossed with Ayrshires forming splendid milking cows. The *Longhorns* have been to a great extent superseded by the previous breed. The *Hereford* breed are stoutly built oxen; they have also, however, been largely supplanted by the shorthorn race; and the *North Devon* breed are now surpassed by others, both as regards feeding and milking. The *Suffolk Dun* is a hornless, or as it is termed, a *polled* breed of cattle. In shape this breed is decidedly inelegant, while the flesh is not regarded as being of fine quality, although the Suffolk cattle are rather celebrated as 'milkers.' Chief of the milk breeds are the *Alderneys*, which give the richest milk, but in small quantity, while for feeding purposes the race is valueless. The *Ayrshire* cattle are similarly inferior as a feeding race or for grazier's purposes, but afford an abundance of very rich milk. They are small in size, and difficult to fatten. Other breeds include the *Welsh* cattle, which are usually small; the *Shetland* cattle, which are very small, but hardy, and can subsist on very scanty pasturage; the *Galloways*, a 'polled' race, which feed tolerably well; and the *West Highland* cattle or *Kyles*, usually of black colour, with long and extended horns, a short muzzle, shaggy hair, and muscular limbs. This last breed, when fattened in the Lowlands of Scotland or in the N. of England, furnishes the richest beef for the London market.

The foreign races of oxen include the humped cattle already mentioned, of which the *Zebu* (*Bos Indicus*) of India is a good example. The Brahmin bull of India is a variety of the zebu. In S. Africa there is a breed of cattle allied to the Indian cattle, but wanting the hump. They are extensively employed as beasts of draught and burden. The influence of the extension of the railway system upon the traffic in dead meat has been of the most remarkable kind. Remote districts, both in England and Scotland, transmit daily to London many tons of beef ready for the market.

Oxalic Acid ($C_2H_2O_4$), a very poisonous acid, whose salts are found pretty abundantly in the vegetable kingdom—in the leaves of wood sorrel, in the stalks of rhubarb, in certain seaweeds and lichens. It may be produced by oxidation of a great variety of organic compounds, and especially from highly carbonised substances containing no nitrogen, such as sugar, starch, cellulose, &c., by treating them with nitric acid, or by fusing them with caustic alkalis. It is manufactured on a large scale by oxidising saw-dust with a mixture of the hydrates of potash and soda, consisting of one molecule of the former and two of the latter. The mixture is made into a thick paste, and then laid in thin layers on iron plates. Here it is gradually heated and stirred. The water in the alkaline hydrate is decomposed,

hydrogen is evolved, and the oxygen goes to convert the wood into O. A., which forms more than a fourth of the grey mass ultimately obtained. This mass is treated with cold water, and oxalate of soda is left undissolved. This is boiled with slaked lime, and the double decomposition which ensues results in the formation of the oxalate of lime, which, by the action of sulphuric acid, yields crystals of O. A. These crystals contain two molecules of water, which may be expelled by a gentle heat, an operation which results in the crumbling of the acid to a soft, white anhydrous powder. If subjected to a high temperature, the crystallised acid decomposes into prussic acid, carbonic oxide, carbonic acid, and water. O. A. is dibasic, and forms an important series of salts known as the oxalates. Of these the oxalates of the alkali metals are soluble in water, the others for the most part insoluble. They all decompose by heat. The most important of these compounds are binoxalate of potash ($\text{KHC}_2\text{O}_4 \cdot \text{H}_2\text{O}$), or salt of sorrel, the oxalate of ammonia, and the oxalate of silver.

Oxalidæ, or **Oxalidæ**, now pretty generally considered a tribe of the natural order *Geraniaceæ*. It consists of about 350 species of herbs, shrubs, or trees, many of the first being tuberous rooted. The alternate leaves are simple, trifoliate or more compound, and are often sensitive; the flowers are generally solitary, on long footstalks, usually of showy colours; the fruit is either a membranous or succulent valved capsule. The plants abound in oxalic acid. The type genus, *Oxalis*, contains considerably more than 200 species, a few of which are scattered over the world, but the bulk are S. African and S. American. The charming little *O. acetosella*, or wood sorrel, so common in woods and moist shady places in Britain, bearing its solitary white flowers, veined with purple, from amidst a carpet of trifoliate leaves, occurs in each of the four continents. It has a pleasant acid taste, arising from the calcium oxalate it contains, and was formerly used as a refrigerant in fever. *O. corniculata* and *O. stricta*, occasionally found in England, are not native; they may be called cosmopolitan weeds. Of the edible species belonging to *Oxalis* the following are most noteworthy. *O. crenata*, the Arracacha of tropical America, is cultivated for its tuberous roots, which are of the size and shape of a small potato. Some years ago it was introduced into England on the likelihood of being a useful garden vegetable, but it was found to be watery and insipid. In Peru it is also grown for its very acid leaf-stalks. *O. Deppei*, a native of Mexico, has tubers more farinaceous than the preceding. In France the stalk and leaves are used cooked in various ways, as also for salad purposes. *O. tuberosa* is cultivated in Bolivia, under the name of Oca, for its potato-like tubers; and *O. crassicaulis* of Peru, and *O. esculenta* of Mexico, also yield wholesome tuberous roots. Several Cape species, as *O. Bowei*, are showy garden and greenhouse plants. In the genus *Biophytum* the pinnate leaves are sensitive, particularly in *B. sensitivum*, in which both leaves and leaflets close downwards. *Connaropsis Griffithii* of Malacca also has irritable leaves. It bears an acid fruit that is eaten cooked, pickled, or preserved with sugar. *Averrhoa Carambola* is cultivated in many hot countries for its fruit (see CARAMBOLA), as also *A. Bilimbi*.

Oxaluria, or **The Oxalic Acid Diathesis**, is a morbid condition of the system, the most prominent symptom of which is the constant presence of crystals of oxalate of lime in the urine. The crystals appear (1) as octahedra; (2) as hour-glass contracted, or dumb-bell like bodies; (3) as compound octahedra; and (4) as small, flattened, bright discs, very readily mistaken for blood discs. The octahedra grow in the urine after it is voided, but the dumb-bell crystals do not, and are mainly formed in the kidney tubes. The significance of the deposit, which is probably a result of chemical changes in the renal passages, is undecided. Dr. Parkes considers that the oxalic acid of urine most probably results from uric acid, and may be a substitute for the excretion of carbonic acid of the lungs. The crystals are insoluble in water, are unaltered by boiling either in *acetic acid* or in *liquor potassæ*, but are soluble in nitric acid without effervescence. The deposit does not indicate structural kidney disease unless tube casts be also present. The persistent presence of oxalate of lime in the urine may give rise to a concretion of the same nature (mulberry calculus) in the kidney or bladder, or to enfeebled health from the action of the oxalic acid on the digestive organs, the heart, and the nervous system. The treatment of such

cases is hygienic and tonic, and articles of diet containing oxalic acid, such as sorrel, rhubarb, tomatoes, &c., should be avoided.

Oxenstjerna, an old Swedish family, whose founder was Bengt Nilsson, in the latter half of the 14th c. The most celebrated of the family was the statesman **Axel Gustafsson O.**, born at Faanö in Uppland, 16th June 1583. After his father's early death, O. studied at Wittenberg and other German universities, until recalled by Karl IX. in 1602 to enter the service of the State. A privy councillor in 1609, he was named by Karl IX.'s testament as a member of the provisional government that should succeed him; but this did not last long, as in 1611 O. prevailed on his colleagues and the Estates of the Realm to declare of age Gustaf Adolf II. Thereafter (1612) he became Chancellor, and from this date he was the chief power in the home government and in diplomatic business. O. was plenipotentiary at the Peace of Knäred in 1613. During the wars with Russia and Poland he showed great energy, being summoned now to lead the army, now to superintend the levying of fresh troops, and again to govern newly-acquired lands. In 1631 he was called to Germany, to be governor of the Rhine Lands. After Gustaf Adolf's death, O. received the management of Swedish affairs in Germany, and at the Heilbronn Conference (1633) was chosen chief of the Evangelical League. In 1636 he returned to Sweden. Here his experience and insight kept him at the head of affairs, and his influence continued undiminished during the first years of Christina's reign. In 1645 he concluded the Peace of Brömsebro, on terms more favourable to Sweden than those which the queen herself had arranged. In the same year he was appointed Count of Södermöre, 'Lagmand' of Herjedalen, and Chancellor of Uppsala University. But Christina's vanity was wounded by O.'s great reputation, and his influence in consequence beginning to yield to that of younger favourites, he gradually retired from public business. O. strongly remonstrated against the resignation of the queen, and died soon after that event, 28th August 1654. See Lundblad, *Svensk Plutarch* (2 vols. Stockh. 1824; Ger. trans. 2 vols. Stuttg. 1826-27).

Ox-Eye. See CHRYSANTHEMUM.

Oxford (Cymr. *wyss*, 'water,' and Eng. *ford*), a city of England, the capital of Oxfordshire and seat of a university, stands at the confluence of the Cherwell with the Thames or Isis, 63 miles W.N.W. of London by rail. Bordered on the N.W. by the Parks of 93, and on the S. by the Christ Church Meadows of 50 acres, it is traversed from N. to S. by St. Giles's or Aldgate's Street, at right angles to which run Broad and the famous High Street, the latter leading to Magdalen Bridge. Most of the colleges are Gothic, the chief exceptions being Queen's (1714), Worcester (1760), Hertford (1820), the Chapel of Trinity (1694), and the Library of Christ Church (1716), which are all in the Grecian style. Christ Church (1528), the largest, has a quadrangle 264 by 261 feet; a hall, 115 feet long by 40 wide and 50 in height, hung with seventy portraits; and a library, with a collection of 254 paintings. The chapel is also the Cathedral of St. Frideswide (1120-80; restored 1856-73), which retains much of its original character, is 168 feet long by 116 wide, and has a spire (the earliest in the kingdom) of 140 feet. Of the other colleges the most beautiful chapels are those of Magdalen (1480), New College (1385), and Merton (1310-1450), all three with lofty towers; Exeter, New, and Magdalen possess the finest halls; and the cloisters of the last two colleges, Mob Quad at Merton, and the cedar carvings by Gibbons in Trinity Chapel, are among the lions of O. The present century has witnessed the restoration of most of the colleges; the rebuilding of the chapels of Balliol (1856), Exeter (1858), and St. Alban's (1863), and of the halls of Pembroke (1848) and Balliol (1876); the erection of Keble College (1868-76), and of new blocks of rooms at Christ Church (1865), Merton (1865), Balliol (1868), and New (1877). Besides the Botanic Garden (1632), there are pleasant college gardens at St. John's, New, Worcester, &c. A striking group of buildings is formed by the Schools (1439; rebuilt 1613-18), comprising the Bodleyan Library (q. v.), Picture Gallery, Divinity School (1445-80), and Convocation House (1639); the Radcliffe Library (1737-49), a domed edifice 100 feet in diameter and 84 in height, which now serves as a reading-room to the Bodleyan; the Sheldonian Theatre (1664-69), in which the Commemoration is held; the Clarendon

Building (1712-30), till 1830 the University Press; and lastly the Ashmolean Museum (1679-83). To the W. of these lie the Taylor Institution (1845), containing Chantrey's models and drawings by Raphael and Michael Angelo; the Martyrs' Memorial (1841), 71 feet high, built on the model of the Eleanor Cross at Waltham; the Union Debating Rooms (1859), with frescoes by Morris and Rossetti; the Radcliffe Observatory (1772-95), 106 feet high; and the University Press (1830). To the N. is the Museum, erected (1856-58) at a cost of £30,000, with a library and a laboratory (1871). Of twenty-seven churches, the principal are the University Church of St. Mary (1300-1488; restored 1827-71), 162 feet long by 50 wide, with an exquisite spire 180 feet high; St. Peter's-in-the-East (1150-1350), with a Norman crypt and chancel; All Saints' (1706-8), St. Mary Magdalen (1320-1531; restored 1875), St. Giles (1120-1220), St. Philip and St. James (1862), and St. Barnabas (1869), built on the model of a basilica. The Roman Catholic Church of St. Aloysius (1875) is the finest of the non-established places of worship. The civic buildings include the Norman castle, built by Robert d'Oilli (1071), now the county prison; a town hall (1752), county hall (1840), corn exchange (1863), the Radcliffe Infirmary (1770), and a workhouse (1863-65). The chief schools are Magdalen College School (1456; rebuilt 1851), St. Edward's, and the Military College. O. has no manufactures of importance, its industries being mainly devoted to supplying the wants of the university. There are eight weekly newspapers; and two members are returned to Parliament by the city, two by the university. Pop. of municipal borough (1871), 31,404. O. (the *Vadum Boum* of the chroniclers, who followed the popular mistaken etymology) is spoken of by legend in the 8th and by history in the 10th c. Its position, commanding the valley of the Thames, gave it a high strategic importance, and it was stormed by the Danes (976 and 1009), by William the Conqueror (1067), and by Stephen (1142). From the 12th c. the history of the city becomes blended with that of the university, the chief events in the municipal annals being the meeting of the 'Mad Parliament' in 1258, when Henry III. (q. v.) granted the Provisions of Oxford; the murderous 'town and gown row' of 1354; the burning of Ridley, Latimer, and Cranmer (1555-56); the Black Assize (q. v.) of 1557; the residence here of Charles I. (1642-43); and the visit of the allied sovereigns (1814). See Ingram's *Memorials of O.* (3 vols. Oxf. 1837), and Parker's *Handbook to O.* (Oxf. 1875).

Oxford, The University of, seems to have had its germ in the cloister schools of Osney and St. Frideswide. First in the reign of Eadward the Confessor does Oxford clearly appear as the place of study, where in the 12th c. the Frenchman Robert Pulein lectured on divinity, the Lombard Vicarius founded a school of civil law, and Giraldus Cambrensis propounded his *Topography*. The immigration of Paris students (1229) was immediately preceded by the arrival of the Friars of Dominic and Francis, who, supported by Grosseteste and Adam Marsh, raised the university to a rank second only to that of Paris. To Edmund Rich, Canterbury's sainted archbishop, Roger Bacon owed his introduction to the Aristotelian philosophy, and in his turn delivered to his pupils the sciences of languages, mathematics, and optics, and to the world at large the *Opus Majus*. Close on Bacon, and like him Franciscans, followed Duns Scotus and Ockham, the leaders of the Realists and Nominalists, of those Northern and Southern 'Nations,' whose feuds in the Barons' War had caused the migration to Northampton of half the students (1260), and who a century later, when Wyclif was master of Balliol, ranged themselves in or against the Lollard ranks. Medieval Oxford was far different from the Oxford of to-day. Though named by Clement V. as one of the four great seats of learning, in a decree (1311) calling on it with Paris, Bologna, and Salamanca to appoint lecturers in Hebrew, Chaldaic, and Arabic, it had no university buildings, its stately colleges were but beginning to arise, and the students lived huddled together in halls and inns, whence they poured forth to frequent and deadly conflicts with the townsfolk. Yet, with few outward attractions, Oxford five centuries ago could reckon its students by thousands—English, French, Scotch, and Welsh, some, like Chaucer's scholar, hollow and threadbare, others richly clad and attended by rascally varlets. The storm of Lollardy over, Oxford subsided into a state of wealthy indolence; its numbers dwindled, its Latin became a byword, and in the

lordly foundations of Wykeham and Waynflete the Italian Poggio found (1420) 'but few lovers of learning, and those barbarous, skilled more in quibbles and sophisms than in literature.' But with the Renaissance came a quick awakening, and Erasmus, writing in 1497, lauds to the skies the Oxford scholars, Colet, Grocyn, Linacre, and More. Heedless of the fierce opposition offered by the 'Trojans' to the 'Greeks,' Fox founded professorships of Greek, Latin, and theology (1516), and Wolsey invited to Cardinal College all Europe's greatest schoolmen. The Cambridge scholars who answered Wolsey's call brought more with them than the New Learning—a new religion, which was shortly to purge the 'asses' stall' of the pagan classics, the Babylonish philosophy, and the whole literature of the Middle Ages. Under Edward VI. all studies save theology were despised, all lecture-rooms deserted but those of Peter Martyr, Bucer, and Fagius; and a Greek line occurring in the midst of a Latin author was passed over with the remark, 'Græcum est, non potest legi.' In 1550 only fifteen students graduated. Of twenty-one colleges thirteen were founded before the Reformation, and two in the brief reaction of Mary's reign, when also the ancient schools were re-established, to be once more abolished by Elizabeth. The latter expelled four Catholic heads of colleges and ninety fellows, while she persistently harassed the Puritans whom Leicester the Chancellor favoured, and it is of her reign that Wood says: 'In Oxford itself you have to search after Oxford University, so greatly is everything changed.' With the Stuart dynasty and with Laud for Chancellor came Arminianism and passive obedience, but withal a reform that founded eight new professorships (the first since 1535), established the principle of public examinations (1638), and required from bachelors a knowledge of classics, grammar, rhetoric, logic, moral philosophy and geometry; from masters, of classics, natural philosophy, metaphysics, astronomy, optics, history, and geography. Bacon looked on the universities as opponents of his learning, and indeed the *Novum Organum* had long to contend with the pseudo-Aristotelian metaphysics of the Schools, but it was at Oxford that the Royal Society was founded (1648). In January 1641 the alarms of St. Mary's and St. Martin's rang Royalist student and Roundhead townsman to arms, and the loyalty of the university in the ensuing troubles is still attested by the scarcity of college plate bearing date prior to Charles's residence at Oxford (1642). That loyalty, shaken by James's ill-judged attempt to restore by force the ancient faith (1687), survived in the Jacobitism and Toryism of the next 150 years, the age of 'organised torpor,' when proctors were proctorised for boozing in taverns of a Sunday (1723), when, according to Gibbon, professors 'gave up even the pretence of teaching,' when Gaisford held the chair of Greek for twenty years without delivering a single lecture, and the proctors were paid from the funds of the professorship of moral philosophy. The university sank to a mere seminary of education, whose value may be estimated from the two solitary questions put to Lord Eldon for his degree (1770), quoted by the University Commissioners—'What is the Hebrew for the place of a skull?' and 'Who was the founder of University College?' The first signs of recurring vigour were the passing of a new Public Examination Statute (1802) and adoption of the class system (1807), the throwing open of the Oriel fellowships, and the great religious movement known as Tractarianism (q. v.). The Oxford Reform Act (1854) led to various important changes—the increase and re-endowment of the professoriate, the general abolishing of close fellowships and scholarships, the assignment of fresh schools to law, modern history, and natural science, the admission of Unattached Students (q. v.), the University Tests Abolition Act (1871), the establishment of local middle-class examinations (1857) and of an Oxford and Cambridge Schools' Examination Board (1873). The chief results of the New Reform Act of 1877 will probably be further secularisation, and the endowment of research by the suppression of 'idle' or 'prize' fellowships, as they are variously termed.

By 17 & 18 Vict. c. 81, the constitution of the University is framed on (1) the weekly Hebdomadal Council, with the initiative in all legislation; (2) Congregation, with powers of amending any new statutes; (3) Convocation, composed (1877) of 4870 members, whose sanction to such statutes is necessary before they can become law, and who confer honorary degrees and elect to university offices; and (4) the House of Congregation, by which ordinary degrees are granted and the nomination

of examiners ratified. The life office of Chancellor is now purely honorary, his duties being discharged by a vice-chancellor, nominated for four years from the heads of colleges in rotation. Subordinate to the latter are two proctors, charged with the oversight of order and morality, the assessor of the Chancellor's court, the public orator, registrar, &c. There are forty-one professorships, viz., six of divinity, seven of *litera humaniores*, twelve of mathematics and physical science, four of law, three of modern history and political economy, three of the fine arts, and six of languages. The Sanskrit Professor receives £900, the Professor of Poetry £100 per annum, but the ordinary stipend is £500. There are also readers, demonstrators, and teachers attached to the university. Of twenty university scholarships the principal are the Craven (1647) for Greek and Latin, open to fourth-year students; the Ireland (1825) for Greek; and the Hertford (1834) for Latin. Besides these there are eighteen prizes, including the three Chancellor's prizes for Latin verse, an English and a Latin essay, the Newdigate (1826) for English verse, the Arnold (1850) and Stanhope (1855) prizes for historical essays, and the two Gaisford prizes (1856) for Greek verse and prose. Degrees are conferred in arts, music, civil law, medicine, and divinity. The ordinary college residence is twenty-five out of the fifty-two weeks, the academical year being divided into four terms, with three vacations—the Christmas, Easter, and Long (June–October). Candidates for a B.A. degree must keep twelve of these terms, and have three examinations to pass—Responsions ('Smalls') the First Public Examination ('Moderations'), and the Second Public Examination ('Greats'), all three of them partly in writing, partly *viva voce*. Responsions (from which all are exempted who have satisfied the examiners appointed by the delegates for the examination of schools) is a simple examination in classics and mathematics. In Moderations passmen are examined in portions of three Greek and Latin authors, logic or geometry and algebra, Latin prose, and unseen passages; and candidates for classical honours in unseen passages, Latin prose, and five Greek and Latin authors (textually and critically), with optional papers on Greek prose, Latin and Greek verse, comparative philology, the Greek drama or Latin Augustan literature, and logic; candidates for mathematical honours, in algebra and the theory of equations, trigonometry, plane geometry, geometry of three dimensions, the differential calculus, the integration of differential expressions, and the elements of the calculus of finite differences. For Greats passmen must take up either classics or a modern language, with two other subjects selected from classical or modern history, political economy, law, geometry, mechanics, chemistry, and physics; whilst classical honoursmen are examined in classics, moral and political philosophy, and classical history. There are also final honours schools in mathematics (pure and mixed), in natural science, jurisprudence, modern history, and theology. All candidates must pass a preliminary examination in divinity, or, where they are excused on the ground of religious scruples, in equivalent subjects. In the class-lists names are arranged alphabetically, not, as at Cambridge, in order of merit. Responsions are held thrice, Moderations and Greats twice every year. The M.A. and other degrees require no residence or examination, being simply a matter of fees.

The colleges of Oxford are corporate bodies, comprising a head (variously styled dean, warden, provost, principal, master, president, or rector), fellows and scholars, and also receiving students not on the foundation, who are termed commoners. The halls are not corporate bodies, and have no fellowships, but otherwise resemble the colleges. The following list gives the reputed date of foundation and the number of undergraduates in 1876:—*Colleges*: University (872), 109; Balliol (1263), 196; Merton (1274), 76; Exeter (1314), 172; Oriel (1326), 83; Queen's (1340), 100; New (1386), 130; Lincoln (1427), 66; All Souls' (1437), 5; Magdalen (1458), 101; Brasenose (1509), 131; Corpus (1516), 60; Christ Church (1546), 244; Trinity (1554), 96; St. John's (1555), 110; Jesus (1571), 57; Wadham (1609), 52; Pembroke (1624), 84; Worcester (1714), 98; Keble (1870), 142; and Hertford (1874), 69; *Halls*: St. Edmund (1317), 35; St. Mary (1333), 46; New Inn (1438), 15; and St. Alban (1547), 60—the total number of undergraduates being 2590. The fellowships, 380 in all, are mostly like the scholarships obtained by open competitive examination, are tenable for life, but are vacated by marriage or by accession to

a fixed income of £600. Their average annual value is £500, which may be increased by tuition, or by holding the post of dean, bursar, &c. Parliamentary returns show that in 1870 nearly half the fellows were resident, fully half were in Orders, and of resident fellows almost all were engaged in public or private tuition. There are 422 college scholarships, of an average value of £80 for five years, and a still larger number of exhibitions, ranging from £20 to £110. Commoners are required to pass a matriculation examination at most of the colleges, and their names should be put down some time beforehand. The general allowance to an undergraduate is £200 per annum, but expenses vary at the different colleges, being higher at Christ Church and Merton than at Corpus or Keble. There are two services daily in each of the college chapels, but compulsory attendance has been abolished in some cases, in others substituted by a morning roll-call. Lectures occupy from three to four hours. The students dine together at six in the college halls, but all other meals are supplied from the buttery in their own rooms. Each college has its boat and cricket club and yearly athletics, and hunting, football, racquets, polo, and the rifle-corps find plenty of votaries. The steeplechases ('horse-grinds') of Christ Church, Merton, and University have been well-nigh suppressed by the authorities. See Wood's *Historia et Antiquitates Universitatis Oxoniensis* (2 vols. 1674), and *Athena Oxonienses* (2 vols. 1691–92; edit. by Dr. P. Bliss, 1813–20); F. Huber, *Die Englischen Universitäten* (2 vols. Kass. 1839–40; Eng. trans. by F. Newman, 3 vols. Lond. 1843); J. C. Jeaffreson, *Annals of Oxford* (2 vols. Lond. 1870); Green, *History of the English People* (vol. i. Lond. 1877); F. Seebohm, *The Oxford Reformers of 1498* (Lond. 1867); C. Hughes, *Tom Brown at Oxford* (Lond. 1861).

Oxford Blues. See HORSE GUARDS, ROYAL.

Oxford Clay, the lower and principal member of the Middle Oolite (see OOLITIC SYSTEM), consists of dark blue or blackish clay, which gives place below, however, to a tough calcareous sandstone known as the Kelloway Rock. The fossil shells of helemnites, ammonites, &c., which abound in the O. C. are most beautifully preserved. Associated with these are also species of crustacea, fish, and reptiles characteristic of the Oolitic period. The formation can be traced N.E. from Oxford to the lands S. of the W., and then N. to Yorkshire.

Oxfordshire, a midland county of England, bounded N. by Warwick and Northampton, E. by Buckingham, S. by Berkshire, and W. by Gloucester. Area, 470,095 statute acres; pop. (1871) 177,975. The surface is undulating, the chief elevations being Broom Hill (836 feet) in the N.W., Shotover Hill (599 feet) near Oxford, and Nettlebed Hill (820 feet) in the S.E. The Thames, or Isis, flows along the southern boundary of the county for some 70 miles, during which it receives on the O. side the Windrush, Evenlode, Cherwell, and Thames. The soil is a light loam, formed by the decomposition of the chalk and limestone of the Cretaceous and Oolitic series. In 1876 the gross rental was £1,232,141, and there were 162,749 acres under corn crops, 57,944 under green crops, 46,071 in clover, sanfoin, and grasses in rotation, 138,827 in permanent pasture, and 15,563 woods. The chief crops are barley, wheat, turnips, oats, and beans. In the same year there were 16,962 horses, 51,724 cattle, 328,657 sheep, and 34,870 pigs. The rich pastures of the Thames basin have made stock-rearing the leading industry, and the manufactures—of gloves, blankets, and lace—are unimportant. Three members are returned by the county, the chief towns of which are Oxford (the capital), Woodstock, Witney, and Banbury.

Oxidation. See OXIDE.

Oxide is generally any chemical compound of oxygen with another element. With the exception of fluorine, all known elements unite with oxygen, and these as a rule combine directly with it. Of the important elements only six are known which cannot be made to form an oxide without the intervention of a third substance. These are chlorine, bromine, iodine, gold, silver, and platinum. Combination with oxygen, or oxidation, is generally accompanied with the evolution of heat, which, when sufficiently rapid, results in combustion. In many cases the

application of heat hastens the oxidation; but if raised to a sufficiently high temperature oxides in general decompose. The metallic oxides form an important group, the members of which are ordinarily bases. The properties of oxides are treated under the various elements—arsenic, carbon, chlorine, iron, lead, manganese, &c. In organic chemistry, the ethers are frequently regarded as the oxides of the corresponding alcohol radicals—ethyl, methyl, phenyl, &c.

Oxleya is a genus of *Cedrelaceæ* represented by *O. xanthoxyla* (now *Flindersia Oxleyana*), a sombre-looking tree, 50 feet high and 6 feet in girth, producing the 'yellow wood' of Queensland—a valuable timber.

Oxus, the ancient name of the *Amu-Darya* (Arab. *Fihân*), a river of Central Asia, which, rising in Lake Serikul, on the Pamir plateau, nearly 15,000 feet above the sea-level, flows in a N.W. direction, and enters Lake Aral by three large streams (Loudon, Taldyk, and Ulkun), and several smaller ones. It separates Badakshan, Balkh, the Kara-Kum desert, and Khiva on the S. from Bokhara and the desert of Kizil-Kum on the N., and forms the southern boundary of Russian possession in Central Asia, according to the treaty of 24th August 1873. In its upper course it receives many streams from the Hindu Kush, the Pamir plateau, and the boundary range in the N. of Bokhara, but in the last 800 miles of its course it is altogether without affluents. Below Khiva its aspect is singularly monotonous and dreary, and towards its mouth there are extensive sand dunes and marshes, partly covered with rushes and tamarisk jungles. As late as 75 n.c. the O. flowed into the Caspian; subsequently it changed its course, and entered the S.E. corner of Lake Aral; again prior to the 14th c. it flowed to the Caspian; and finally, towards the end of the 16th c., it discharged its waters into Lake Aral, near its S.W. extremity. Some light seems to be thrown on the cause of the change in its course by a consideration of the uses to which its waters are put in Khiva at the present day. The result of eight measurements during the flood season of 1874 shows that the average discharge of the stream at Toyuboyin ('camel's neck'), above the irrigation canals at Khiva, was 122,000 cubic feet per second, while at Nukús, below the same canals, it was only 59,600. During the 80 days of flood about one-half of the whole volume of the O. is diverted to make Khiva a luxuriant oasis. General Ivanien states that 2½ feet of earthy matter is deposited during a single flood season in Khivan canals, and this is removed annually by manual labour. But the yearly deposits in the main stream accumulate, and must consequently tend to choke the passage of the river. At Toyuboyin the O. rushes along a narrow pass cut through a bed of compact limestone. Some 60 miles farther on, at Surakhan, it rather suddenly attains its maximum breadth of 10,000 feet, and here the great waterspread is gemmed with alluvial islands, covered towards the end of summer with high, golden-eared, waving grass. From this point its breadth gradually decreases to 1500 feet at Khodjelli, and to 1200 feet at Kungrad. During floods its depth varies from 15 to 30 feet in various localities. Its velocity in some places is 6 miles an hour, but is very variable, mainly on account of the irregular slope of the channel, which varies from 11 to 3½ inches per mile between Toyuboyin and its mouth. During the flood of 1874 the *Petroffsky*, an Aral flotilla steamer, made a slow and troublesome ascent as far as Surakhan. The chief difficulties of navigation are the shoals and the scarcity and cost of fuel (30s. a ton). The restoration of the O. to its old channel, a work of no great engineering difficulty, is said to be under the serious consideration of the Russian government. See J. Wood's *Journey to the Source of the O.* (1873), Vámbéry's *Sketches in Central Asia* (1868), Hellwald's *Russians in Central Asia* (1874), Major Herbert Wood's *Notes on the Lower Amu-Darya, Syr-Darya, and Lake Aral in 1874* (*Journal of the Royal Geographical Society*, 1875), the official *Report of a Mission to Yarkund in 1873-74, under command of Sir T. D. Forsyth*, and Petermann's *Mittheilungen* (No. 52, 1877).

Oxygen (symbol O, atomic weight 16) is the most widely distributed of all elements. It exists *free* in the atmosphere, forming about one-fifth part by volume, and in chemical combination with other elements constitutes at least one-half by weight of the known crust of the earth. At ordinary temperature and pressure it is a colourless, tasteless, odourless gas; its specific gravity is 1.1056; it dissolves in water to the extent of 3 volumes

in 100. Until recently it was classed among the *permanent* gases, those namely which had never been condensed to a liquid state. Towards the close of 1877, however, Cailliet of Paris and Pictet of Geneva, working independently, succeeded in liquefying it. The former employed the same means to liquefy the other gases, hydrogen and nitrogen; and the latter supplemented this by reducing O. and even hydrogen to the solid form. The year 1877 has, therefore, seen the last of the permanent gases. Pictet has estimated the density of liquid O. as equal to that of water—a result in strict accordance with the theoretical views formerly published by Dumas of Paris.

Though O. exists *free* in the air it is not from this source that it is most conveniently obtained. It was in this way, however, that Lavoisier first obtained pure oxygen towards the end of last century. His method consisted in keeping mercury at its boiling point exposed to the air, thus eventually forming the *red oxide*. By raising this compound to a higher temperature it is decomposed into O. and mercury. Oxide of silver (Ag_2O) decomposes similarly under the action of heat. Other metallic oxides, such as peroxide of manganese (MnO_2), peroxide of barium (BaO_2), and anhydrous chromic acid (CrO_3), are also a source of O., and decompose when heated into the gas and a less oxygenised oxide. The chlorate of potash (KClO_3) when heated sufficiently high yields all its O., being decomposed into the chloride of potassium and the gas. A small quantity of peroxide of manganese hastens the action which then takes place at a more moderate temperature. This is perhaps the most important of the various methods for the preparation of O. Sulphate of zinc (ZnSO_4) decomposes when heated into oxide of zinc (ZnO), sulphurous acid (SO_2) and O. gas. Still another method of obtaining O. is by electrolysis of water, decomposing water by an electric current. The O. is given off at the electrode which is connected with the positive pole, the hydrogen being disengaged at the negative electrode. The disengagement of O. and its combination with other elements are continually taking place in nature. It is essential to the support of animal life. Absorbed by the lungs or the gills of animals, it enters into feeble combination with the red colouring matter of the blood, and is thus carried to all parts of the body. The hydrogen and the carbon of the tissues unite with it to form water and carbonic acid, a combination attended by the evolution of heat. The blood returns to be again aerated and oxidised, while the carbonic acid is expired. Under the influence of sunlight the green colouring matter of plants decompose carbonic acid in the presence of water, absorbing the carbon into the plant tissues and evolving O. The plant and the animal thus play into each other's hands, the one undoing what the other is doing. As indicated before O. is present in nature combined with other elements in great abundance. Its compounds will be treated of in detail under the elements of which they are the oxides. As a general rule it may be taken that at least one oxide of a metallic element is a base, and that the oxides of the non-metallic elements (excluding of course fluorine, which has no known oxide) are generally acids. Many elements form more than one oxide, but the quantity of O. present in one always bears a simple proportion to the quantity present in another. The important theoretical bearing of this is noticed under **ATOMIC THEORY**. The presence of O. in the sun has been lately proved by Draper. In what manner it is present is not yet understood, since it does not give absorption lines like the other elements, but instead is detected by its *bright* lines. See **SPECTRUM ANALYSIS**. A peculiar allotropic form of O. is **Ozone** (q. v.).

Oxyrhynchus, a genus of Teleostean fishes probably belonging to the genus *Mormorus*, in which the snout is pointed and a long dorsal fin exists. This fish was the Egyptian *Kha*, was accounted sacred, and was dedicated to the goddess *Athor*. In modern Egyptian it is named *Miselch*.

Oxyuris Vermicularis, the common thread-worm, is small, white, and thread-like, the female being about one-third of an inch long, and the male about half that length. It exists, generally in great numbers, in the colon or rectum of badly-fed, delicate children. The symptoms are, itching at the anus or nose, and the worms may be observed in the faeces. **Treatment**—Enemata of cold water, infusion of quassia or tea, or of liquor calcis, repeated daily. In the case of adults, perchloride of iron, half an ounce to 2 pint of water, is recommended. See articles VERMIFUGES, and WORMS.

Oyer and Terminer, an English law term derived from the French *ouir* and *terminer*, to hear and determine. It is the first and largest of the five commissions by which the judges of Assize (q. v.) sit in their circuits. It empowers them to judge in cases of treason, felony, and trespass. In the event of any sudden insurrection or riot, a special commission of O. and T. may be granted to try specified persons and offences.

Oyster (*Ostraea*), a well-known genus of *Lamellibranchiate* Mollusca, the type of the family *Ostracidae*, in which the shell is inequivalve (i. e., one half or valve is larger than the other), and slightly inequilateral. It may be free or attached, and the 'hinge,' or portion by which the valves are articulated, usually wants teeth. There is an internal ligament, used in opening the shell, and the lobes or halves of the mantle are entirely separated. The foot is small, and has a *byssus* or 'beard' in the young state only. Only a single *adductor muscle*, for closing the shell, is developed; the O. being thus a Monomyarian bivalve. Of all molluscs, the O. is the most famous and valued. It occurs in many seas, but apparently attains its greatest excellence and abundance in the seas of temperate zones. The lower valve or half of the shell, by which the animal attaches itself to the sea-bed, is the largest; a result probably due to the increased nutrition and growth of the under valve of the shell. The interior of the valves is lined with a delicate and smooth layer of *nacre* or *mother-of-pearl*, which in other species of oysters (e. g., the Pearl O.), may form *Pearls* (q. v.). The Pearl O., however, belongs to a different family from the Common O. The following account of the structures connected with the opening and closing of the shell is taken from Dr. Andrew Wilson's *Sketches of Animal Life* (Chambers, 1877):—

'Whoever has tried to open an O., well knows the extreme difficulty experienced in gaining access to the delicate morsel within. And a very slight examination of the animal and its shell after the operation has been performed, would serve to show that the chief obstacle which resisted the efforts of the knife consisted of a bundle of strong fibres, which connected the valves of the shell internally, roughly speaking, at about their middle. When this bundle of fibres is cut across, the O. is rendered utterly helpless; and any one who has simply tapped a living O. as it lay in the water with the shells slightly opened for breathing purposes, must have formed some idea of the power of these fibres to close the shell, from the quick snap with which the animal brings the shells together.

'The bundle of fibres thus seen in an O. simply represents a single great *muscle*, the function of which is to close the shell. Hence this muscle is appropriately enough named the 'adductor.' Its fibres act precisely in the same manner as that in which those composing human muscles act—namely, through the peculiar property possessed by muscle-fibre, and which is named *contractility*. In virtue of this power, muscle-fibres can shorten themselves in obedience to some stimulus, and by shortening themselves they of necessity bring together the structures between or to which they are attached. The tap on the outside of the oyster's shell represents the stimulus, which incites the contraction of the muscular fibres, thus producing the closure of the shell. Some shell-fish possess two of these muscles, and are thus doubly provided in the way of protective apparatus. It is clear, however, that the muscle in the O. can play no part in the reverse action of opening the shell. In the performance of this action a most economical arrangement is witnessed. Between the shells, and at the hinge or that surface by which the shells are joined together, a stout structure may be found in the O. and its allies, named the *ligament* of the shell. This is a highly elastic structure, and its elasticity forms the means whereby the opening of the shell is effected. For, as the ligament is greatly compressed when the shells are brought together by the muscles, it follows that when the muscles are relaxed, the elasticity and recoil of the ligament will force the shells apart. We thus note that whilst the closure of the shell is a muscular act, and one involving a considerable amount of exertion, the opening of the shell is due to a purely mechanical arrangement, and is an action effected without trouble to the animal. When the shell is kept closed, the muscles are in a state of tension, since the elasticity of the ligament is opposed to the action of the muscles. But as the closure of the shell is not an act of frequent performance—the normal state of these animals being that of existing with an unclosed shell—the muscular power of the animal is thus

husbanded, and the shell is kept open by the elasticity of the ligament—an action, as we have seen, requiring no effort on the part of the mollusc. No better instance, perhaps, could be found than the present of the economical ordering of Nature's ways and works.'

Lining the interior of the shell a soft delicate membrane named the *mantle* is found. This membrane is that on which the formation and growth of the shell depends; and as already stated in the definition of the O. family, the halves of this mantle are completely separated from one another, so that when the shell is opened the water required for breathing in the gills of the animal flows into the body by the simple unclosure of the shells. The O. has a complete digestive system, comprising a mouth, stomach, intestine, and liver; its food consists of the minute organisms and particles of matter which are swept into the mouth by the currents of water passing into the gills. It has a heart for the propulsion of the blood, and the gills appear in the form of four delicate folds of membrane, disposed two on each side of the body, and richly provided with *cilia*. By the constant action of these microscopic filaments the circulation of water already mentioned is duly maintained. The nervous system consists of three chief nerve masses or *ganglia* connected by nerve cords, and disposed in the various regions of the body.

The reproduction and development of the O. forms a subject of the greatest importance, and one upon which the legislation regarding the mollusc is founded. The sexes are united in the O., and fertilisation of the eggs therefore takes place within the body of each mollusc. The O. produces enormous numbers of eggs, collectively named *spat*. The exact number of eggs is difficult to calculate, but it is certain that not less than half-a-million of eggs, and in all probability many thousands more, are produced by each mollusc. The O. spawns from the month of June to near the end of September. The old saying that oysters may be eaten in any month the name of which does not contain the letter 'r' is thus founded upon the fact that in the names of those months in which the O. breeds that letter does not occur. The egg-mass, whilst still within the parent-body, becomes of a milky, creamy colour and appearance, and the eggs are retained within the body until the preliminary stages in development have been concluded. The chief information regarding the development of this mollusc has been obtained from the memoir of Lacaze-Duthiers, of date 1854-55; while more recently (1874) Salensky has studied the subject. After the yolk of the egg has become augmented so as to produce the *morula* stage (see DEVELOPMENT), the layers of the *blastoderm* or germinal membrane divide into an outer (*ectoderm* or *epiblast*) and an inner (*endoderm* or *hypoblast*). A few *cilia* next appear on the portion of the young O. known as the *velum*, at which point the ill-defined head-extremity is afterwards developed. At the hinder extremity of the embryo the shell next begins to be developed, while the digestive system is duly formed from the germinal substance within. In what is known as the *veliger-stage* the young O. appears to possess a *velum* or fold of membrane, composed of 2 lobes and possessing *cilia*; and by means of the vibratile action of the latter filaments the young animal—or the 'spat' generally—is conveyed for immense distances through the sea. After the stage in which the shell has grown larger, the young O. leaves the body of the parent, and, according to Lacaze-Duthiers, it remains for forty-three days in this stage without altering its form. It appears soon to attach itself after this stage, and the gills and heart then become developed. As regards the period at which the O. attains its full growth, these molluscs are said to be full grown at three years. At the end of one month the O. is said to be of the size of a pea; at the end of six months it attains the length of $\frac{3}{4}$ ths of an inch; and a year old may measure from $1\frac{1}{2}$ to 2 inches.

The oysters which are best known are the Common O. (*Ostraea edulis*), with its especial varieties and breeds; the Horsefoot O. (*O. hippopus*) of the Mediterranean; the Milky O. (*O. latula*); the Folded O. (*O. plicata*), &c. Oysters congregate in great 'beds,' the exact localities and extent of which have been pretty well defined, although there is little doubt that many O. beds exist which are as yet barely known, and which present a rich field for future enterprise. The demand for oysters has originated the cultivation and growth of these molluscs in specially-formed or artificial beds. The latter are well seen at Lake Fusaro at Naples, and in the Bay of St. Brienne, the Bay of

Arcathon, and the Ile de Ré in France. The green oysters of Marennes are equally celebrated. Whitstable in England is the chief place for artificial O.-beds. On the N. American coasts immense supplies of a species of O., the *O. Canadensis* or long-hinged O., are found. The celebrity of the O. dates from antiquity. The Romans consumed immense numbers of these molluscs. According to Pliny, Sergius Orata was the inventor of the O.-pond. Fossil oysters are well known. They are first represented in Carboniferous strata, and are common in both Mesozoic and Tertiary rocks. *O. Couloni*, *O. aquila*, and *O. Marshii* are three familiar extinct species.

Law Regarding O. in Great Britain.—31 and 32 Vict. c. 45, empowers the Board of Trade to grant parts of the sea-shore of Great Britain to persons for the forming of O.-beds. It also appoints a close season between the 15th June and the 1st of September. In Ireland the Irish Fishery inspectors have powers similar to those exercised by the Board of Trade in Great Britain. Any one stealing oysters or O.-brood from an O.-bed, knowing the same to be the property of another, is guilty of larceny; and any one using a net or dredging instrument on the ground of the bed, though no oysters be taken, is guilty of a misdemeanour, punishable by fine and imprisonment; but the Act does not prevent any one from catching floating fish within the limits of the O.-bed, with instruments suitable for catching floating fish only. The close season by convention with France is maintained in the sea between France and England; and O. fishing-boats are at that season subject to the surveillance of the officers of the coastguard or of the navy.

Oyster Bay, a post village and township of New York, U.S., to the N.E. of New York city. The village, situated on a sheltered bay, is a favourite watering-place. The township extends across Long Island from the Sound to the Atlantic, includes twelve villages, and has a pop. (1870) of 10,595.

Oyster-Catcher (*Haematopus ostralegus*), a species of *Grallatorial* or wading birds, otherwise known as the 'sea-pie.' It inhabits the sea-shore, and attains a length of 16 inches. Its plumage is black above and pure white beneath. The bill is very long, and is flattened from side to side. The food consists of molluscs, such as limpets, &c., which it detaches from the rocks, by aid of its beak. The nest is a mere hole scooped out of the ground, and the eggs, numbering three or four, are of a yellowish-olive colour spotted with brown. The O. C. is common in Lincolnshire fens.

Oyster-Catcher.

Ozœ'na (Gr. *ozō*, 'I smell') signifies a discharge of feetid, purulent matter from the nostrils. See **NOSK, DISEASES OF**.

Ozanam, Antoine Frédéric, a Frenchman of a singularly pure and earnest character, was the son of a physician, and was born at Milan, April 23, 1813. His father subsequently removed to Lyon, where O. was educated. In 1831 he published *Reflexions sur la Doctrine de Saint Simon*, went to Paris in the following year to study law, and was brought into relation with Chateaubriand, Ampère, Ballanche, Montalembert, and Lacor-

daire. Along with some other students, he founded (1833) a religious and charitable association which afterwards became the 'Société de Saint Vincent de Paul.' In 1839 appeared his *Dante et la Philosophie Catholique au XIIIe Siècle*, which is considered one of his finest works. After filling for a short time a chair of commercial law at Lyon, he was called at the close of 1840 to assist Fauriel at the Sorbonne in the chair of Foreign Literature, and was made professor in 1844. His career was a brilliant success. Gifted with a rare talent for exposition, both critical and poetic; rich in knowledge, and original in thought; of a sympathetic heart; winning in manner, and chaste in ethics, he drew crowds of admiring auditors, and inspired them for the time with something of his own exalted enthusiasm and religious faith. Withal, he was a robust Liberal in politics, and never wavered in his hatred of despotism and his hope for democracy. Even the miserable Revolution of 1848 did not discourage him. He died of consumption at Marseille, September 8, 1853. No finer embodiment of the Christian character has appeared in modern France. Among his other works may be mentioned *Études Germaniques pour servir à l'Histoire des Francs* (Par. 1847-49); *Documents inédits pour servir à l'Histoire d'Italie depuis le VIIIe. jusqu'au XIIIe. Siècle* (Par. 1850); *Les Poètes Franciscains en Italie au XIIIe. Siècle* (Par. 1852). His *Œuvres Complètes* were published at Paris (8 vols. 1855). See Montrond, *Fr. Ozanam, Tableau Historique et Biographique* (Lille, 1869), and Kathleen O'Meara, *Frédéric Ozanam, Professor of the Sorbonne; his Life and Works* (Edinb. 1877).

Ozie'ri, a town near the centre of Sardinia, on Mount Acuto, about 1000 feet above the sea, near which are many of the peculiar round towers called *nuraglie*. Pop. 7965.

Ozo'cerite, or **Ozo'kerite** (Gr. *ozō*, 'I smell,' and *keros*, 'wax') is a native mineral wax or paraffin found in sufficient abundance to be of commercial importance in Moldavia and Galicia. It is of a dark greenish brown colour, sub-translucent, soft, and waxy, and can be kneaded in the hand. When purified it forms a hard paraffin, having a high melting point, which has been utilised in candle-making. O. is found in small nodular masses at Uphall in Linlithgowshire, and at Urpeth Colliery, near Newcastle-on-Tyne; but these deposits are of no commercial importance. See **PARAFFIN**.

Ozone' (from Gr. *ozō*, 'I smell') is a peculiar form of oxygen. There is still some doubt as to its true nature, since it has never yet been obtained free from ordinary oxygen. Oxygen can be ozonised in various ways, such as by the slow combustion of phosphorus or other substance, or by passing electric sparks through it. Oxygen prepared by electrolysis contains O. mixed with it. Heat, or even simple contact with a variety of substances, converts O. into oxygen again. Dr. Andrews has shown that if O. be shaken up with broken pieces of glass it is rapidly reconverted into common oxygen. The presence of O. is readily distinguished by its odour, from which the name is derived. All experiments go to prove that ozonised oxygen occupies less space than common oxygen—i.e., is denser; and probably its molecular formula is O₃, that of oxygen being O₂. O. exists in minute quantity in country or sea-side air. In crowded cities no indication of its presence can be perceived. One of the best chemical tests for O. is a damp mixture of starch with potassic iodide. Strips of white cartridge paper brushed over with this remain unchanged in common air, but when exposed to ozonised air they become blue. With reference to the vital properties of O., Dr. Andrews has shown that it is more active than common oxygen, and rapidly renders an animal subjected to it insensible because of its energetic action.

P.

the sixteenth letter in the English alphabet, having the same place and the same symbol as in Latin, and corresponding to the Semitic Pe and the Greek Pi, from which latter (II) its form is directly derived. It is a thin labial, cognate with *b*, *f*, and *v*, with all of which it is frequently interchanged. In the affiliated languages it is also represented by the gutturals *q*, *k*, and *c*. Thus, Gr. *hippos* = Lat. *equus*; Gk. *ophthalmus* = Lat. *oculus*; and a similar variation is found between Zend and Sanskrit. The following are examples of the more regular changes:—Gr. and Lat. *pater* = Ger. *vater*, and Eng. 'father'; Gr. *pous* and Lat. *pes* = Eng. 'foot'; Gr. *pente* = Lat. *quinque*, Sanst. *panch*, Ger. *fünf*, and Eng. 'five'; Gr. *episcopus* = Fr. *evêque*, and Eng. 'bishop.' In the Greek alphabet there existed two additional consonants compounded with P.—viz., *ph* (*φ*) and *ps* (*ψ*). The former is generally represented in other languages by the letter *f*, from which etymologically it is quite distinct; the latter was very little used, and is often weakened to simple *s*. Cf. Lat. *capra* = Fr. *caisse*. 'Psalm' in English is pronounced without the *p*. In abbreviations, P.M. stands for *post meridiem*; P.R. for *populus Romanus*; P.P.C., on a visiting card, for *pour prendre congé*; P.C. for Privy Councillor, or sometimes for police constable.

Pa'ca (*Calogenys*), a genus of *Rodent* quadrupeds inhabiting S. America, and noted for the size of their cheeks, the upper jaw overhanging the lower, and causing the muzzle to appear broad and clumsy. 'Cheek pouches' are developed. The Sooty P. (*C. Paca*) is the common species. It attains a length of about 2 feet, and is of a blackish brown colour, marked with longitudinal rows of white spots. The P. destroys large quantities of sugar canes in the W. Indian islands. It swims with great ease, and lives in burrows. The flesh is highly esteemed by the Indians.

Pacay' is a name given to *Tyrosopsis dulcis*, a small thorny tree of Peru and other dry regions of S. America. The white succulent matter in which the seeds are imbedded is used as food, and the pods serve for feeding cattle. See MESQUIT and MIMOSÆ.

Pace (Lat. *passus*, Fr. *pas*) is vaguely used to denote a stride in walking. The Romans defined it as the distance between the raising of one foot to the setting down of the same again (see MILE); and this was the accepted meaning of the old so-called *Geometrical P*. The word has received a definite meaning only in military marching, when it is understood to be the distance between the two feet from heel to heel. In slow marching time its length is 30 inches; in double time, 36 inches.

Pachomius, an Egyptian monk of the 4th c., is known as the founder of the Cenobites (q. v.), or of the cloister life. A soldier in his youth, P., when converted to Christianity, became a monk on the banks of the Nile. Disciples flocked to him to perfect themselves in asceticism, and he established (about 340) a residence on the island of Tabenna in the Nile, where they might dwell together (Gr. *koinobion*), distinguished from the *Lauræ* or association of separate dwellings of the Anchorites (q. v.) by the observance of certain rules; strict obedience to himself as president or Father (*abbas*) being one of the chief. The details of his 'rule' he left at his death (348) in *Præcepta, judicia, et monita*, translated by St. Jerome.

Pachydermata (Gr. 'thickskins'), the name given to an order of mammals in Cuvier's classification. It included those

quadrupeds which have thick skins;—*e.g.*, the elephant, rhinoceros, hippopotamus, tapir, and pig. In modern classifications of Mammalia this order is entirely abandoned, its members being distributed among other groups, and more in accordance with scientific arrangement and natural affinities. Thus the majority of P. are grouped together in the order *Ungulata* (q. v.), or that of the 'hoofed' quadrupeds. The elephant has been placed in a special order—that of the *Proboscidea* (q. v.). The hippopotamus belongs to the *Artiodactyle* (or 'even-toed') group of *Ungulata*, in which the swine also is included. The rhinoceros is an 'odd-toed' or *Perissodactyle* Ungulate, and so is the tapir.

Pacific Ocean, the watery expanse between Asia, the Malay Archipelago, Australasia, and America. Its length from N. to S. is 9200 miles, and its greatest breadth, in 7° N. lat., about 10,300 miles. Its area is 80,000,000 sq. miles, equalling that of the other four oceans put together, and occupying two-fifths of the surface of the globe. On the American side the P. O. has few inlets or islands, but the Asiatic side contains the Behring, Okhotsk, Japan, Yellow, and China Seas, and abounds in countless islands, which stretch eastward for two-thirds of the breadth of the ocean. The Pacific is to a large extent girdled by volcanoes, *e.g.*, in the Andes and Central America, the Aleutian and Kurile Islands, Japan, the Philippines, New Hebrides, and New Zealand. Many of the islands scattered over its centre are also more or less volcanic, the chief active volcano in them being that of Mauna Loa in the Sandwich Islands. Mr. Dana is of opinion that in the central Pacific there has been a subsidence over a very wide area to a depth of not less than 9000 feet, and in the Coral Sea (q. v.) of 2000 feet. In Peru, Alexander Agassiz found indications leading him to conclude that the Pacific within a comparatively recent time extended through gaps in the coast range and formed an internal sea, which stood at a height of at least 2900 feet, and probably much higher.

The drainage into the Pacific is remarkably small for the extent of its coast line, the principal rivers falling into it being those of Siberia, China, and Siam. The watershed of America being very near the W. coast, the only large rivers debouching into the P. O. are the Yakon in Alaska, the Fraser in British Columbia, the Oregon a little farther S., and the Rio Colorado falling into the Gulf of California.

In spite of its name, which was bestowed upon it by Magellan, the P. O. is not very different from other oceans in regard to storms. Fearful Typhoons (q. v.) rage in the China Sea; there is an annual hurricane season in the tropical S. Pacific; and heavy westerly winds are usual between New Zealand and S. America. The trade winds are not so distinct as in the Atlantic, and are more powerful on the American side, on account of its freedom from islands. See TRADE WIND, and MONSOONS. A sargasso sea, smaller than that of the Atlantic, exists in 30°–40° N. lat., in long. 135° W., and another of yet smaller size about 600 miles E.S.E. of New Zealand. With respect to the currents of the P. O. see CURRENTS, OCEAN.

The investigations made by the *Challenger* Expedition have shown that the depth of the P. O. increases slowly from S. to N., the mean difference between the depth of the S. Pacific and that of the N. Pacific being about 6000 feet. Between Tahiti and Juan Fernandez the average depth was found to be 12,960 feet, between Tahiti and Hawaii 15,600 feet, and between Hawaii and Japan 17,148 feet. According to Sir C. W. Thomson, in the N. Pacific there is an enormous extent of water of great depth, in many cases going below 18,000 feet. Between the Caroline and Ladrone groups a sounding of 27,450 feet was obtained, and one of 23,700 feet off Japan. Notwithstanding

the increasing depth of the bottom, the temperature rises from the S. northwards. Still in the N. Pacific, at depths of from 300 to 1500 fathoms, the temperature is generally lower than that of the N. Atlantic at the same depths. Down to 12,000 feet the bottom is largely composed of a deposit of minute shells, called globigerina ooze. Below that depth the bottom consists of reddish-brown clay, silicate of the oxides of iron, and manganese with alumina. There is also much pumice and other volcanic matter lying about on this floor, but vegetation is believed to be impossible, so far out of reach of air and light.

Reports of the existence of the P. O. first reached Europe through Columbus, but the first European to behold it was the Spaniard Balboa, on 29th September 1513. In 1521 it was first traversed by Magellan, and among subsequent navigators of its waters the most distinguished names are those of Tasman, Dampier, Cook, Anson, the two Bougainvilles, La Perouse, Vancouver, and Flinders.

Pacini, Giovanni, an Italian composer, son of Luigi P., the famous bass buffo-singer of Syracuse, was born 11th February 1796, studied at Rome, Bologna, and Venice, in the last of which cities he brought out the first of his 90 operas, *Annetta e Lucinda*, at the age of eighteen. For thirty years he was Director of the Conservatorio at Viareggio, near Lucca. Among his best operas are *Saffo*, *L'Ultimo Giorno di Pompeia*, and *Medea*. He was deficient in originality, imitating alternately Rossini, Bellini, and Donizetti. P. died December 6, 1867, leaving an interesting book of *Memoirs*.

Pacinian Corpuscles, the name applied to bodies of oval shape, which occur on certain of the nervous trunks of the sympathetic and cerebro-spinal nervous systems. They are well seen in the mesentery, and have been named after Pacini, who first described them. They appear in many cases to receive the terminations of nerves, and to possess this relation to the cutaneous or superficial nerves of the hands and feet, while they are also found on the large branches of the sympathetic plexus in the neighbourhood of the *abdominal aorta*. Each Pacinian corpuscle is attached to its nerve by a very narrow and slender stalk. Microscopically investigated, it seems to consist of concentric layers of a very fine membrane, between the intervening spaces of which layers a fluid exists. A single nerve-fibre may be seen to pass through the narrow pedicle or stalk of the Pacinian corpuscle, this nerve-fibre entering a central cavity in the organ, and finally terminating at its free end in a dilatation or enlargement. The exact functions of the Pacinian corpuscle are quite undetermined.

Packfong, or **Tutenag**, a Chinese alloy essentially the same as that known in Great Britain as German or nickel silver, containing copper 8 parts, zinc 6½, and nickel 3. Although this compound has come into use in Europe only within comparatively recent years, it has been known and used in China from a very remote period.

Packhorse, the name applied to a breed of horses formerly employed in England and in other countries for the conveyance of goods, which were contained in bundles or panniers slung across the back of the animal. The P. was short-legged and stoutly made, and was famed for its powers of endurance.

Pacou'ry-U'va, the Brazilian name for the fruit of *Platonia insignis*, a beautiful tree of that country. It is said to be very sweet and delicious, whilst the seeds have an almond-like flavour. The wood of the tree, which belongs to the Gomboge family, is very hard.

Pactolus (mod. *Sarabat*), a small river of Lydia, in Asia Minor, which, rising on the northern slopes of Mount Tmolus (*Bor-Dagh*), flows northwards past Sardis and joins the Hermus (*Kodus*). Its golden sands, famed by the classic poets, had ceased to be productive in Strabo's time.

Pactum de Quo'ta Li'tis is an agreement between the counsel or agent, and client, for sharing the subject of an action. Such an agreement was void by Roman law, as it is by the law of England and of Scotland. In England, see **CHAMPERTY**.

Pactum Ill'citum, a term of Roman law (adopted into Scotch law) denoting an illegal contract—the general rule being that no action can lie for fulfilment of a contract contrary to law; but there is a distinction drawn between a case in which there

is turpitude on both sides, and a case in which turpitude attaches to only one of the parties. In the former there can be no action for restitution. In the latter, the consideration given *ob turpem causam* must be restored whether the counterpart of the bargain has been performed or not.

Pacu'vius, Marcus, a Roman dramatist, the nephew of Ennius (q. v.), was born at Brundisium about 220 B.C., lived at Rome, where he earned his bread as a painter and actor, and died at Tarentum, having nearly attained the age of ninety. His dramas, modelled on those of Sophocles and Euripides, but less slavishly than was the case with his predecessors, were held in high esteem by his contemporaries and by the later Romans. The fragments still extant have been collected by Ribbeck in his *Tragicorum Latinorum Reliquia* (Leips. 1852).

Padang, the capital of the W. Coast Residency in Dutch Sumatra, is situated at the mouth of a river of the same name in lat. 1° S. It is a free port, and has Protestant and Roman Catholic churches, a military hospital, and various government buildings. The climate, although very hot, is comparatively healthy, and there is an extensive trade, chiefly in coffee, not only with Java but directly with Europe. The part of the town on the left bank of the river is inhabited almost solely by Malays, who live in bamboo huts; that on the more elevated right bank is occupied by a mixed population of Europeans and Chinese, living in substantial houses of wood and stone. Pop. 25,000.—The districts of Upper and Lower P., together with Singkel and Tapanoeeli, form the Residency of the W. Coast, and include some of the most beautiful and fertile regions in the tropical zone. Only the low and marshy coast lands are oppressively hot and unhealthy; the slopes of the high volcanic mountains which intersect the districts have a delightful climate, and produce abundance of coffee, pepper, indigo, rice, cassia, ratans, coconuts, and caoutchouc. In Upper P. are the most extensive coffee plantations. Throughout the Residency there is also a considerable yield of gold, quicksilver, iron, copper, lead, and diamonds. The Dutch established their settlement at P., the first in Sumatra, in 1660. See **SUMATRA**.

Paddle, a spoon-shaped wooden instrument for propelling boats or canoes, still in use among savage nations, but among civilised peoples superseded almost entirely by the oar. The paddler sits or stands with his face looking forwards, and if he is alone in his canoe propels it by dipping the P. alternately on either side. This is the one advantage which the P. possesses over the oar, in using which the rower must necessarily sit looking backwards; but it is an advantage which is appreciable only in threading narrow and winding streams, since in propulsive power the oar is infinitely superior.

Paddles or Paddle-wheels are a modification of the ancient P., suitable for being driven by machinery. A number of paddles are, so to speak, fitted together radially as the spokes of a wheel which is made to revolve so that the blades are successively immersed in the water; and by the reaction of the water upon them the vessel is propelled. These blades are simply flat boards, and are technically called *floats*. Most power is of course gained when the floats all pass through the water perpendicular to the direction of greatest pressure—i.e., when they are vertical. This evidently is not possible if the floats are fixed rigidly to the radii of the wheel. The *feathering paddle-wheel* of Elijah Galloway, patented in 1829, remedies this drawback by adjusting movable floats mechanically, so that they are kept in position as long as they are in the water. The liability to derangement of this adjustment, however, prevents its use in sea-going steamers, which are usually provided with the ordinary radial wheel with fixed floats. By making the wheel as large as possible, and by setting the axis of the wheel as high as possible above the surface of the water, the floats may be made to enter the water nearly vertically, and deviate but little from the true vertical position during its passage through the water. The lowest float should always be fully covered by water. Though of ancient date, paddle-wheels were not effectively used till the introduction of steam as a motive power. See **STEAM NAVIGATION**.

Paddlefish (*Spatularia* or *Polyodon Spatula*), a peculiar species of *Ganoid* fishes, belonging to the *Sturionida* or sturgeon family. The snout is long and flattened, while the body is smooth and destitute of the hard bony plates and scales so typi-

cal of other members of the sturgeon family. The *P.* inhabits several N. American rivers.

Paddy, a word of Malayan origin, which has been universally adopted by Europeans in India for rice in the husk, whether growing or cut, before threshing. The native name is *dhan*. The proportion of 'paddy' to husked rice is about as 7 to 10, estimated by weight.

Padell'a (It. 'a frying-pan') is an earthenware dish, like a broad flat flower-pot without any hole in the bottom, filled with fat, and having a stout wick in the centre. The apparatus when lighted forms a very effective means of illuminating public buildings, arches, and open spaces.

Paderborn, a town of Prussia, province of Westphalia, at the source of the Pader (whence its name), an affluent of the Lippe, 19½ miles E. by N. of Lippstadt by rail. It has one Evangelical and four Catholic churches, among which are the Cathedral (11th-13th centuries), in the Byzantine style, with two beautiful portals, and the silver sarcophagus of St. Liborius (1627). *P.* is the see of a Catholic bishop—at present (1878) suspended by the German Government—and has a Catholic priests' college, which from 1592 to 1819 was a University, several cloisters for nuns and monks, and a Catholic and Jewish orphanage. There is an important wool-market. The industries of the town are brewing, and the manufacture of oil, tobacco, wax-cloth, starch, and flour. Pop. (1875) 13,728. *P.* was founded by Karl the Great, who held a diet here in 777. The bishopric of *P.*, founded in 795, was the first in Saxony, and reached its greatest importance under Meinwerk (1009-35). Under the prince-bishop Theodor of Fürstenberg (1585-1618), it rejected Lutheranism, which it had previously embraced. Its territory, which fell to Prussia in 1802, after being part of Westphalia from 1807-13, was restored to Prussia in 1815. See Bessen, *Geschichte des Bisthums P.* (2 vols. Paderb. 1820), and Giefers, *Die Anfänge des Bisthums P.* (Paderb. 1860).

Padiham, a town of Lancashire, England, on the N. bank of the Calder, 9 miles N.E. of Blackburn, near the Rose Grove station of the Lancashire and Yorkshire Railway. It has an old parish church, a modern church (1866) with a tower 96 feet high, and several large cotton factories. There are extensive stone-quarries and coal-mines in the vicinity. Pop. (1871) 6675.

Padilla, Juan de, a Spanish noble, sprung from an illustrious Toledan family, headed the rebellion against Charles V. which originated in Toledo, and which soon spread itself over the whole of Castile. Appointed in 1518 commander of the Spanish troops at Saragossa, *P.* soon afterwards accepted the chief command of the rebel army. He made himself master of Segovia, Tordesillas, and Valladolid, but was completely routed in the battle of Villalobos, 23d April 1521. After a heroic resistance he was wounded, taken prisoner, and executed next day. *P.* and his noble-hearted wife, Dona Maria de Pacheco, who defended Toledo for some time after her husband's death, and then escaped to Portugal, have always been most popular figures in Spanish history, and have formed the subject of many dramas and poems.—*P.* is also the name of two Spanish poets, the elder of whom, known as *El Carthusiano* ('The Carthusian'), born at Seville in 1468, died 1518, is notable as the first imitator of Dante. His poem, *Los doce Triunfos de los doce Apostoles*, was republished in London as late as 1843. The younger *P.*, a contemporary and friend of Cervantes, died in 1599. He wrote popular poems in all styles. His chief collections are *Eglogas*, *Sonetos*, &c. (Sev. 1582), *Tesoro de varias Poesias* (Madr. 1580 and 1587), and *Romancero* (Madr. 1583).

Padishah (Pers. *pād*, 'protector'; cf. Sansk. *pāti*, 'master'; and *shah*, 'king'), one of the titles borne by the supreme ruler among the Persians and Turks in the diplomatic language of the Divan, was originally accorded only to the kings of France, but during the last century has been extended to the emperors of Austria and Russia, and even to the heads of secondary powers.

Padua (Ital. *Padova*, Lat. *Patavium*), a town of N. Italy, capital of the province of the same name, 21 miles W. by S. of Venice, is situated in a fertile plain, on an arm of the Bacchiglione, and is a station on the Venice and Verona Railway. The town is widely built, surrounded with high walls, fortified also with ditches and bastions; and is about 6 miles in circumfer-

ence. The streets are interspersed with gardens, but are mostly narrow, presenting an antique appearance, and containing fine buildings, chiefly of the period of the Renaissance. The largest square and promenade is the Piazza Vittorio Emanuele (formerly Prato della Valle), of elliptic form, with fountains and seventy-four statues of 'auditors *Patavini*', or distinguished men who have studied in *P.* These are arranged in a double row, and commemorate among others Stephen Bathori, Petrarch, Tasso, Ariosto, John Sobieski, and Galileo. In the S.E. is the church of San Giustina, a noble edifice with a fine interior, completed in 1549. It has eight cupolas 174 feet high; the nave is 364 feet long by 98 broad, and it contains several fine paintings, among which is the 'Martyrdom of St. Justina,' by Paolo Veronese. The church of San Antonio, commonly known as 'Il Santo' was begun in 1256, the principal part completed in 1307, the remainder with the seven domes in 1475, and the whole restored after a fire in 1749. It is larger than that of San Marco at Venice, being 300 feet long, 147 feet wide across the transepts, and 123 feet high in the centre. It contains many fine paintings. Adjoining is the Scuola del Santo, an oratory adorned with seventeen frescoes by Titian and his pupils. To the right of San Antonio is the Museo Civico, with a library and a collection of coins, bronzes, and terra-cottas, and having in front the bronze equestrian statue of Gattamelata by Donatello, 1443. Other buildings are the Eremitani, an Augustinian church of the 13th c., restored of late. It contains celebrated frescoes, the chief by Andrea Mantegna. On the N. side of the piazza in front of the church, is the chapel Madonna dell' Arena, erected in 1303, and adorned with frescoes by Giotto in 1304. In the vicinity is the church of I Carmini, before which stands a monument to Petrarch, erected by the town on the 18th June 1874, the 500th anniversary of his death. The Palazzo della Ragione, now the Municipio, erected in the 11th c., and remodelled in 1420, is celebrated for its great hall with vaulted wooden ceiling, 273 feet long by 90 feet broad, and 78 feet high. It is said to be the largest hall unsupported by pillars in the world. The University of *P.*, founded by Pope Urban IV. in 1263, was celebrated in the Middle Ages. It possesses a library of 120,000 volumes, a botanic garden—the oldest in Europe—and an observatory, with a tower 138 feet high. In 1874-75 it had 52 professors and 1217 students. The manufactures of *P.* are unimportant, with the exception of silk cloth, leather, and catgut, but there is considerable trade in cattle, wine, oil, and corn. Pop. (1874) 44,607.

P. is one of the oldest cities of Italy. Roman legend ascribed its foundation to the Trojan chief Antenor, but it first becomes historical after the conquest of Cisalpine Gaul. Under the Roman Empire it was the most important city of N. Italy, and only yielded to Rome in the number of equites it returned to the census. It was the birthplace of the historian Livy. Destroyed by Attila in 452, rebuilt by Narses, and again destroyed by the Lombards, it was, during a part of the 13th c., a possession of the tyrant Ezzelino, but it afterwards remained a free state, until it became subject to the Carrara family in 1318. *P.* passed (1403) under the power of Venice, together with which it fell into the hands of Austria, was taken by Napoleon 1805, restored 1814, and became a part of the kingdom of Italy in 1866. In the history of art *P.* is of importance. It gave its name to the school founded by Squarcione in the first half of the 15th c. The greatest Paduan master was Andrea Mantegna (q. v.) See *Annali della Città di P.*, by Gennari (3 vols. Bassano, 1804).

Paducah, a city of Kentucky, United States, on the Ohio River, near the mouth of the Tennessee, has a county court-house, fifteen churches, several mills, factories, and tobacco houses, two daily and four weekly newspapers. A large transit trade is carried on. Pop. (1870) 6866.

Pæ'an (from *id Pæan*, the burden of the chorus), the Greek choral song addressed to Apollo before a battle or after a victory.

Pædo-Baptism. See BAPTISM, INFANT.

Pæ'ony or **Peony** (*Pæonia*) is an extensive genus of showy plants belonging to the natural order *Ranunculaceæ*, among which they are distinguished by their introrse anthers, a calyx of five persistent sepals, five or more petals, stamens rising from a glandular disc, and fruit of from two to five many-seeded follicles bursting inwards. The species, with trifling exceptions, are strong-rooted

herbaceous perennials, and are natives of Europe, Asia, and N.-W. America. The common P. (*P. officinalis*), an old-fashioned garden favourite with large single or double blood-red flowers, is a familiar representative, as is also the white P. (*P. albisolia*), a native of northern Asia. The roots of this are sometimes boiled and used as an article of food by the natives of Siberia. *P. fragrans*, from China, has large scented double red flowers. *P. coralina*, with large crimson flowers, has been established on Steep Holmes Island, in the estuary of the Severn, for 150 years, but was originally introduced. The tree P. (*P. moutan*) is a shrub that in China attains a height of 10 feet, bearing handsome purple flowers, for which reason it is a garden favourite in that country and Japan. In 1789 it was imported into European culture, and horticulturists have obtained a range of various colours—white, pink, and purple. *Moutan* is its vernacular name, meaning 'king of flowers.' Formerly medicinal properties were ascribed to plants of this genus, the name P. being taken from Paion, in Greek mythology, the god of medicine.

Paer, Ferdinando, an Italian composer, was born at Parma, 1st June 1771. In his fifteenth year he produced the opera of *Circe* at Venice, where he completed his musical education. In 1801 he was appointed chapel-master to the Elector of Saxony at Dresden, where he composed several operas—*Leonora*, *Camilla*, *I Fuorusciti*, &c.—which were performed with brilliant success. After the battle of Jena he became conductor of the chamber music and composer to the Emperor Napoleon, and took up his residence for the remainder of his life at Paris. In 1810 he produced his *chef d'œuvre*, *Agnese*. For three years (1823–26) he was director of the Italian opera in the French capital. P. died 3d May 1839.

Pæstum (Gr. *Poseidonia*), an ancient seaport of Lucania, in southern Italy, on the Salso, 26 miles S.S.E. of Salerno, contains, with the exception of Athens, the finest specimens of Greek architecture in the world. Within its cyclopean walls, 3 miles in circumference, are a temple of Neptune (63 yards long by 28 wide, with thirty-six columns $7\frac{1}{2}$ feet in diameter), a so-called basilica (59 yards by 26 $\frac{1}{2}$, with fifty columns $6\frac{1}{2}$ feet in diameter), and a temple of Ceres (35 yards by 15, with thirty-four columns 5 feet in diameter). Another temple, a theatre, and an amphitheatre are probably of Roman date. No traces now exist of the famous rose gardens. P. was founded, according to Strabo, by Greek colonists from Sybaris about 600 B.C. It came into the hands of the Lucanians in the 4th, and of the Romans in the 3rd c. B.C., and in 871 A.D. was sacked by the Saracens, and abandoned by its inhabitants. The temples, stripped of their marble by Robert Guiscard, have been described by Swinburne (1779), Wilkins (1807), and De la Gardette (1790; new ed. 1840).

Pagani'ni, Nic'olo, the most wonderful of violinists, was born at Genoa in February 1784. At the age of nine he received lessons from Costa in his native city, and shortly afterwards was taken to Rolla, a celebrated master at Parma, who declared he could teach him nothing. He studied counterpoint, however, under Geratti, after which he gave concerts in the N. of Italy with immense applause. Till his forty-third year he performed only in his native country, but from 1827 to 1834 he made brilliant appearances in Germany, France, and Great Britain, not only dazzling and fascinating the public by his marvellous single string performances and similar feats, but striking such maestros as Rossini and Meyerbeer with positive wonder. P. acquired a vast fortune. He was author of a great number of ingenious instrumental pieces, including twenty-four violin caprices and twelve sonatas for the violin and guitar. He died May 27, 1840. See *P.'s Leben und Treiben*, by Professor Schottky (Prague, 1830). An elaborate analysis of his style of playing will be found in Fétis' *Biographie Universelle des Musiciens*.

Pa'ganism, or **Heath'enism**, is the name applied to the old polytheistic religions which were superseded by Christianity. The name arose at a comparatively late period, when the old religion was lingering among the *pagans* (Lat. *pagani*, Gr. *paganoi*, 'country-people') in the remote regions, after the towns had been Christianised. The first use of *pagani* in the religious sense occurs in Tertullian. The name 'heathens' had a similar origin. Literally it means 'the dwellers on the heaths'—i.e., the rude, wild, and ignorant part of a nation, those who lived far away from towns, and who therefore clung most tenaciously to their ancient and hereditary beliefs.

Page (Fr. *page*; Ital. *paggio*; Low Lat. *pagius*; derivation uncertain, but supposed by some to come from Gr. *pais*, *paidos*, a 'boy'), a youth employed in the service of a prince or noble. In the first half of the Middle Ages he was little more than the slave of a great lord, and could be exchanged at the will of his master like a horse or a hound. But gradually his position improved. When the sons of the smaller nobility, for the sake of a knightly education, entered the households of the great barons, they were appointed to minor posts of honour which marked them off quite distinctly from low-born menials. But it was in Spain during the 16th and 17th centuries that the system of Court-attendance received its most elaborate development, and pages underwent the most minute instruction in their ceremonial duties. So long as the feudal system lasted, with its fixed distinctions of classes, the discipline that a page underwent, as a preparation for the higher grade of squire, which in turn led the way to knighthood, gave a reality to the office. Now, however, in the altered conditions of society, it is very nearly a sham, and it may be presumed that the race of pages who still feebly grace royal and ecclesiastical Courts will ere long become extinct.

Paging Machine is an ingenious contrivance for paging ledgers, or for numbering railway tickets, cheque-books, &c., with a consecutive series of numbers, hence also known by the name of numbering machine. There are several kinds of such machines, which are adopted for working either by hand or power. The construction in common use is that several wheels or rowel-formed circles have engraved on their circumferences the numerals from 0 to 9. The number of the wheels depends upon the range of the required notation, thus six discs may number from 1 to 999,999. The wheels usually revolve on one axle, and by the action of a lever the *units* wheel is advanced step by step till it reaches the figure 9, when a catch or a spring causes the *tens* wheel to move forward one step, at which it remains stationary till the units wheel, in completing another revolution, again sets it forward another stage. In like manner the *tens* wheel acts on the *hundreds* wheel, and so on through the others. Some machines print the first number with a series of non-expressive cyphers before it, but in improved machines the wheels bearing those cyphers are temporarily thrown out of gear. A P. M. is self-inking, and it may be designed to print alternate numbers or any other combination.

Pa'go, an island belonging to the Austrian crown-land of Dalmatia, lies 3 miles off the coast of Croatia, from which it is separated by the channel of Morlacca. Length, 37 miles; area, 110 sq. miles. The surface is rocky and elevated, rising as high as 886 feet. Vine-growing, fishing, and the manufacture of salt are the chief industries. Pop. (1870) 5152.

Pago'da, the name applied by European nations to the Hindu temples in S. India, and also to a gold coin of the value of 7s. 6d., which was formerly coined at the Madras mint, with the device of a temple on one face. The Hindu name for the coin was *varaha*, from the boar of Vishnu; the Mahomedan name was *hun*. The derivation of the word is quite uncertain, but it was apparently introduced by the Portuguese. In ordinary usage a P. is understood to have the shape of a square tower, highly ornamented, diminishing upwards by each successive storey. Some of these buildings are as much as 200 feet high, and form well-known landmarks to sailors. Among the most celebrated are those at Juggernath (q. v.) in Orissa, at Trichinopoly, and in the island of Rameswaram in Palk's Straits.

Pagurus, a well-known genus of Crustacea (q. v.), represented by the *P. Bernhardus* and by other species of the 'Hermit-Crab' (q. v.).

Paharias, an aboriginal tribe in British India, inhabiting the hills of Rajmehal, overlooking the Ganges, in the Bengal district of the Sonthal Pergunnahs, number about 70,000. Ethnologically they are important, as their language proves them to be the most northerly colony of the Dravidian races, whose home is in S. India. See Colonel Dalton's *Descriptive Ethnology of Bengal* (Calcutta, 1872).

Pain is an uneasy sensation in animal bodies, varying in intensity, and generally proceeding from pressure, tension, spasm, or any derangement of function of the nerves of sensation. P. is an important, though not an invariable symptom of disease; for many disease processes are absolutely painless. P. of the

most intense description may be present apart from inflammation, and even the P. of inflammation varies very considerably, as inflammation of the largest and the most vital organs may be accompanied with little or no P., while in that of some of the smallest the P. may be intolerable. Much depends on the extensibility of the inflamed part, but much more on the peculiar sensibility of the organ; while, in some cases, it is often impossible to ascertain the physical cause of P., the most severe P. being experienced in conditions of the body which are compatible with perfect health. P., however, is an important symptom of disease in general, and of inflammation in particular; and the persistence of P. in any given part, in conjunction with disorder of the general system, indicates disease. P. in a part does not necessarily imply disease in that part—e.g., P. in the right shoulder may indicate disease of the liver; or P. in the knee, disease in the hip-joint. There are great differences in individuals as regards sensitivity, depending upon idiosyncrasy, and such peculiarities mark individuals of every tribe and race. There are also times during which individuals are more susceptible to painful impressions than at other times.

Paine, Thomas, a political writer and agitator celebrated for the part he played in the American and French Revolutions, was born at Thetford, in Norfolk, England, 29th January 1737. His father was a quaker, to whose trade of stay-making P. was brought up. In 1759 he settled as a stay-maker at Sandwich, and married; but on the death of his wife two years later, he gave up his trade and obtained a situation in the Customs. In 1771 he married a second time and entered a tobacco warehouse, but having aroused the dislike of his employers he was dismissed, became bankrupt in 1774, separated from his wife by mutual consent, and after obtaining letters of recommendation from Franklin, at that time the commissioner in London from the American colonies, set sail for the New World. P. resided at first in Philadelphia, where he contributed articles to the *Philadelphia Magazine*. He took a lively part in the quarrel with England, and in 1776 published his famous pamphlet *Common Sense*, in which he urged the colonists to strike for their independence. The pamphlet had an enormous sale, and a powerful effect. During the rest of his career, P. adopted 'Common Sense' as his favourite *nom de plume*. In 1777 he was appointed by the Congress Secretary to the Committee of Foreign Affairs, an office which, however, he retained only two years. In 1781 he accompanied Colonel Laurens to France to negotiate a loan, and was rewarded for his success by a grant of \$3000 from the Congress and the estate of New Rochelle from the State of New York. He revisited France in 1787, and in 1790 published in England his *Rights of Man*, an able reply to Burke's *Reflections on the French Revolution*. The work gained him great popularity in France, and led to his being created a French citizen and elected Member of Convention for Calais in 1792. Having in this capacity opposed the execution of the King, advocating his banishment to America, he was cast into prison by the Robespierre party, where he lay for ten months. Here he occupied himself with the composition of his *Age of Reason*, a coarsely deistical pamphlet, which estranged many of his friends. In 1802 P. returned to the United States, and spent the remaining years of his life in retirement. He died at New York, 8th June 1809, and was buried in his own grounds. In 1819 his bones were conveyed to England by William Cobbett, and in 1839 a monument was erected over his empty tomb at New Rochelle by some friends. Biographies of P. have been written by Chalmers, Cobbett, Cheatham, Rickman, Sherwin, and Vale. In 1856 a complete edition of his works was published by J. P. Mendum, Boston, and a complete collection of his political writings was issued in 1875 by Truelove, in one volume.

Pains and Penalties, Bill of, is a bill before Parliament to inflict punishment on any one beyond the power of the law then in force. See under *BILL—Bill of Attainder*, and *B. of P. and P.*

Painted Lady (*Cynthia Cardus*), a well-known species of *Lepidoptera* (q. v.), or Butterflies (q. v.), common in the S. parts of Britain in summer.

Painting, the art of representing scenes, objects, figures, and incidents, real or imaginary, by the use of colours on flat or curved surfaces. As a vehicle of human expression, P. takes

high rank among the Fine Arts, and it is known to have ministered greatly to the instruction of mankind from the earliest age of which we have any record. Of the origin of the art it is vain to speak, but it is probably as old as language itself, and it certainly is the oldest known form of written language, for before the invention of letters the historic records of the earliest civilised nations consisted of painted representations of scenes and animals, of heroes and heroic actions. (See also EGYPT, HIEROGLYPHICS, PYRAMIDS.) When it is remembered that Giotto (q. v.) began his artistic career by sketching with a piece of slate on the flat surface of a rock, there is no reason to doubt the extreme antiquity of the pictorial art on the ground of the scarcity or the necessarily rare and complicated character of the materials required for its practice. Yet though of such ancient origin, and cultivable, within limits at least, with materials of the simplest kind, the development of the art of P. has been subject at frequent intervals to periods of vicissitude and decline. The artistic genius has successively blazed and gone out in darkness in Egypt, Greece, and Italy, though in the last the wonderful revival of the 15th and 16th centuries, which culminated in Michael Angelo (see BUONAROTTI), Raphael, and Titian, has given a quickening impulse to European art which is felt to our own day. And P. is still strictly a European art, for although in America within our own time a school of art has sprung up, which, while it is vigorous and of ample promise, yet it is still 'provincial,' and to some extent without form and void. Of the arts of India, China, Persia, and Japan it is unnecessary here to speak, as they are sculptural, and architectural or decorative, rather than pictorial. But formative art is shared in by the most primitive nations; even the Eskimo carve with great skill and beauty, and even draw and paint with humour and expression, though their designs manifest a scorn for perspective, and for relative proportion. See Dr. Rinks' *Tales and Traditions of the Eskimo*, illustrated with native designs.

Before sketching the development of P. in the different countries and at the different epochs at which it flourished distinctively, it is desirable to refer briefly to the technique or mechanical processes of the art of P., and to glance at its principal subdivisions or styles. This part of the subject, it may here be noticed, is already partially treated under such headings as CHIAROSCURO, COLOUR, DISTEMPER, FORESHORTENING, FRESCO, GENRE, PERSPECTIVE, &c. All subjects which are either in themselves pleasing to the eye, or are dramatically effective in composition, whether in themselves pleasing or otherwise, come within the sphere of the arts. P. may be said to concern itself chiefly with portraits, historical or imagined incidents, landscapes, under which sea pieces may be classed, and still life. By the last term is meant the pictorial representation of game, fruit, flowers, plate, &c. An attempt to revive fresco P. in a modified form has recently been made, but without much success. This silica or water-glass P., the best English specimens of which are probably the 'Death of Nelson' and the 'Meeting of Wellington and Blucher after Waterloo' by Maclise, is carried on more successfully in Germany. It may be said that the two great kinds of P. at present are P. in oils and in water colours.

The invention of oil-P. is stated by Van Mander to have been made by Jan Van Eyck in 1410 (see EYCK, VAN). In the year named this painter was only fourteen years of age, and subsequent writers prefer to attribute the invention or rather the improvement in the process to Eyck's elder brother Hubert. The improvement substantially consisted in the adoption of a new colouring medium. 'It was,' says Wornum, 'literally varnish-P. Oil-P. in the strict sense of the term was neither a mystery nor a novelty in the time of Hubert Van Eyck.' Tuttilo, a monk of the convent of Saint Gall in Switzerland, and himself one of the most celebrated painters and gold-workers of his time, published a treatise on P. 'giving directions for P. in oil,' about the close of the 9th c., or nearly 500 years prior to the supposed discovery by Van Eyck. Since the days of that famous painter many vehicles or mediums for laying on colour in oil-P. have been invented, the one most generally used being the well-known 'megilp,' a compound of mastic, varnish, and drying (i.e., boiled) linseed oil. The oil painter's implements are his colours and brushes; he rests his canvas, which is stretched firmly over a frame, upon the easel, and he occasionally uses a maul-stick to steady the hand that wields the brush.

In oil-P., it is customary, after having conceived the subject and arranged the composition, to sketch in the design in pencil or charcoal, or to strike out the outline at once with a brush, using dark colour. The heads, draperies, and accessories are then put in, and the whole worked up to completion. The main processes are pretty well settled by the warrant of the practice of masters in all ages. In matters of detail, however, the painter follows his own inclination; and a bushel of hints or directions on such minor matters are worthless in comparison with an occasional visit to a studio, or an examination of unfinished works. Of such unfinished works in which we see the technique in actual operation, there are examples in the National Gallery, London, in the National Gallery of Scotland, and in most large collections. Of two examples on permanent exhibition in the National Gallery, Edinburgh, one is Wilkie's 'John Knox dispensing the Sacrament at Calder House,' in which only a few of the heads and indications of drapery are painted in, but the whole subject is carefully and delicately sketched in pencil, which seems to indicate that Wilkie refrained from using colour till his design was fairly completed. The other unfinished work, which is equally indicative of the painter's method of working, is John Phillip's 'Spanish Children Playing at a Bull Fight.' Here only one or two figures are at all complete, while the remaining figures, with the sweeping rows of seats of the amphitheatre forming the background, are merely outlined with the brush in dark brown, showing that it was this great artist's method to paint upon a rude sketch in dark colour.

P. in water-colour is now engaging the whole attention and talents of some of the greatest English artists. In this mode of P. paper takes the place of canvas in oil-P., and water the place of oil, while the mediums and vehicles used and the technical process of laying on the colours are different from those employed in oil-P. Gum-arabic is the vehicle best adapted for general use with water-colours, as it does not degrade the more delicate pigments; isinglass, which is thick, and looks like the 'megilp' of the oil-painter, is also much used, as well as a solution of borax in water and gum tragacanth, which dries sufficiently firm to allow tints to be repeatedly laid one over another without moving or 'washing up.' The white and the yolk of eggs are also employed, the former to make the colours blend more evenly on the paper, the latter for the opposite purpose of 'stopping out' the washes of colour from points where high lights are required, but which the wash would have destroyed. When so used the yolk is afterwards scraped, and the desired light reappears. The rules of Chiaroscuro (q. v.) and composition are the same for water-colour as for oil-colour work. The mode of working is as follows:—The paper damped with water having been very carefully stretched on a drawing-board, is allowed to become thoroughly dry. A clear outline of the subject is then drawn on it, without, however, any extra vigour of stroke to indicate light, shade, foliage, &c., as these effects are to be obtained by the use of the brush alone. A wash of warm colour is then applied over the whole surface. After being allowed to dry thoroughly, the paper is washed over with pure soft or distilled water. This process of tinting, drying, and washing (the tints varying in degrees of warmth) is several times repeated, and the result is an aerial tint of great purity, not to be otherwise attained. Having thus obtained a feeling of atmosphere, the sky, clouds, &c., are proceeded with, and finally the tones of the distance and the objects of the mid-distance and foreground are treated. In these later stages of working in water-colour the painter, as in the case of oils, will use the processes and the expedients which study and practice have proved to him are most effective. On the constantly varying methods of different artists it is impossible to dogmatise.

History of P.—Egypt.—Pictures have been discovered on the walls of the tombs and temples of Abousambul (q. v.) which are considerably upwards of 3000 years old, and the colours of which still retain their original freshness. The earliest painted portrait on record is that of Amasis, King of Egypt, which was presented to the Greeks of Cyrene 600 years B.C. Belzoni analysed the Egyptian method of painting as displayed in the tomb of the kings at Thebes, and his examination, according to Wornum, 'leaves no doubt as to the method in which the Egyptian artists commenced their work. The outlines were first drawn in red upon the flattened wall and were afterwards corrected in black. The next process was to lay on a coat of lime-wash, which in these tombs is so clear and

beautiful as to surpass the finest white paper. The colouring was then executed by the painter upon this white ground, and when the P. was completed the whole was covered with a coat of varnish.' The usual colours are red, yellow, green, and blue, of which there are two tints, and the mediums used in laying them on were glue and wax. Resinous varnishes and others made of glue were in use. There are many specimens of ancient Egyptian paintings in the British Museum. These show no evidence of perspective, nor indeed of any principle of art, except, in rare instances, light and shade.

Greece.—Few Greek paintings remain, but the works of the ancient writers are full of historical information on the pictorial art of the country. The art appears to have reached Greece through Egypt and Asia Minor. Its historic age commences after the defeat of Xerxes. Polygnotus of Thasos (q. v.), the first great painter of Greece, arrived in Athens about 463 B.C. He excelled in mechanical skill, in character and expression, and in the elegance and lightness of his draperies, and he opened to the Grecian mind the path that led to the highest possibilities of pictorial art. Among his contemporaries were Dionysius, a famous portrait painter, and Panæus, who painted the 'Battle of Marathon,' and decorated the 'Olympian Zeus' of Phidias. Apollodorus of Athens and Zeuxis (about 400 B.C.) added dramatic effect to the fidelity of their immediate predecessors—the former is regarded as the first great master of light and shade; the latter, the painter of Helen of Croton, exalted form in Greek art to an elevation undreamt of before his time. Parrhasius (q. v.) was believed to have surpassed Zeuxis, and Timanthes, his rival, excelled in ingenious invention. During the Alexandrian period P. reached perfection in form and refinement, and began to verge upon luxury and decay. The first masters of this age were Pamphilus (q. v.), Apelles (q. v.), Melanthius, Nicomachus, the most rapid painter of his time; Aristides, his brother, reputed the greatest of the Greeks in expression; Protogenes, a famous animal painter; and Euphranor, Pausias, Nicias, and Athenion, painters in encaustic, and the last of whom, but for an early death, 'would,' according to Pliny, 'have surpassed all men in painting.' The decline of Greek art set in about 300 B.C., and after a short downward course through caricature, *genre*, and still life, the artistic genius of Greece expired.

Revival of P. in Italy.—After the destruction of Corinth by the Romans (B.C. 146) Rome drained the ancient world of its works of art. Greek artists followed Greek art, and before the Christian era Rome was full of painters. The history of painting in Rome is divided into three periods—the first, or great period of Greco-Roman art extends from the Roman conquest of Greece to the time of Augustus; the second reaches on to the latter part of the 3d c.; the third comprehends the period of the Exarchate, when Rome, after the foundation of Constantinople, was in its turn drained of the artistic treasures of Greece, which were thenceforth to decorate the churches and the palaces of the New Rome. In Constantinople sprung up a fresh school of P., already noticed under the heading Byzantine Art (q. v.), and the new capital of the Roman Empire—in which the arts were cherished during the Middle Ages—was the source of the revival of painting in Italy during the 13th c. After the conquest of Constantinople by the Venetians in 1204, free intercourse sprang up between that city and the cities of Italy; and Greek or Byzantine artists, transferred westward to embellish the Italian palaces, carried with them the canons of ancient Greek art, which quickened the modern school of Italy into life. 'Schools' of P. were early formed in Florence, Venice, Pisa, and Siena. The first name that stands out on the revival of art in Italy is that of Guido of Siena, whose large 'Madonna,' bearing date 1221, is still preserved in his native city. Giunta of Pisa, a painter of frescoes and easel pictures, produced a 'Crucifixion' at Assisi in water-colours in 1236, still extant. Cimabue (q. v.), the first painter among the moderns of great fame, was born at Florence in 1240. He is still classed as belonging to the formal Byzantine school, though his drawing is more correct and his expression more animated than those of the Byzantines generally. Giotto (q. v.), Cimabue's pupil, vastly improved upon his master, and his works mark the first great epoch in modern P. He was the first to throw off the Byzantine trammels, and to seek his inspiration rather from nature than from tradition. Taddeo Gaddi (q. v.) excelled Giotto in colouring and light and shade. Andrea Orcagna (about 1340-75), one of the most eminent among the successors of Giotto,

did not go beyond the founder of the Italian school in P., but was greatly distinguished as a sculptor and architect. He painted a 'Hell' from Dante's *Inferno* at Florence, in which he placed his friends among the blessed and his enemies among the unblessed. Simone Memmi, one of Giotto's rivals, was the well-known painter of Petrarch's 'Laura.' He painted in all the great cities of Italy, and died at Avignon in 1344. About this time the school of Florence, to which all these followers of Cimabue and Giotto belonged, had become famous throughout the whole peninsula, and in 1349 they organised themselves into a society or guild under the name of the Company of St. Luke. A similar guild was established in 1355 at Siena. It is interesting to note that in this era, a good colourist, Cennino Cennini (born about 1360), won for himself the distinction of being the first Italian author on painting. His *Trattato della Pittura* discusses the rudiments of design, colouring, materials and their use, tools, fresco-P., distemper on walls, and perspective, oil-P. with oil thickened in the sun, gilding, distemper ('guazzo') for panels and canvases, the method of preparing grounds, gilding, varnishing, and illuminating parchments, taking casts from life, &c. (see the English translation of Cennino Cennini's *Trattato*, by Mrs. Merrifield, Lond. 1844).

While the Florentines were thus rapidly advancing in art, good progress was being made in the Roman, Umbrian, Venetian, and other schools. Among the Romans, Gentile da Fabriano (q. v.) went far beyond Giotto and his school, and his 'Adoration of the Kings' is now one of the most highly prized of the early pictures in the Academy at Florence. With the establishment of the rule of the Medici in Florence in the 15th c., the Florentine school greatly extended its influence, and the history of the school of Florence becomes the history of P. in Tuscany from this period. P. advanced to a distinctly new and higher stage of development in the beginning of the 15th c., when Pietro della Francesca and Paolo Uccello, by devoting their fine talents to perspective, reduced that principle to a system, and when Masolino brought the mystery of light and shade—formerly but very imperfectly understood—within the comprehension and practice of the period. Masaccio, Masolino's pupil, deserves more than any other individual painter to be called the father of modern P. His style was essentially modern, his composition dramatic, his forms and character individual, his general treatment natural. The twelve frescoes in the Brancacci Chapel (Church of the Carmelites, Florence), a few of which, however, were executed by Masolino and by Filippino Lippi, constituted, until the advent of Raphael, the models for all the great painters of Rome and Tuscany. Masaccio's style of composition and design, not in an altered, but only in an expanded form, was perpetuated in the works of Raphael and the great Romans, who recognised truth in the frescoes of the illustrious Florentine. Among his contemporaries were Fra Angelico (q. v.), Gozzoli (q. v.), Fra Filippo Lippi (q. v.), and his son Filippino. Fra Filippo Lippi excelled in chiaroscuro and colour, and, devoting his chief attention to external qualities, inaugurated the cultivation of the sensuous in art. In this respect he worked in a direction opposite to that of the artistic religious, Fra Giovanni. His 'Martyrdom of St. Stephen' in the Cathedral of Prato, Florence, is considered his masterpiece. He occasionally painted *in oil*, and was one of the first Italian painters to adopt this method. 'This practice,' writes Wornum, 'was introduced into Italy by Antonello da Messina about 1450 or 1455, and was made known at Florence by Domenico Veneziano about 1455-60. Andrea del Castagno obtained the secret from Domenico, and is said afterwards to have killed him, apparently in the year 1463.' Other famous Florentines of this period, the close of the 15th c., are Sandro Botticelli, Raphaelino del Garbo, Domenico del Ghirlandajo (q. v.), Cosimo Roselli, Antonio del Pollaiuolo, Andrea Verocchio, and Luca Signorelli. Meantime the schools of Rome, Venice, Padua, and Bologna had already palpably felt the impulse that had been given at Florence to the revived Italian art. Perugino (q. v.), the master of Raphael, appeared at Rome toward the close of the 15th c.; Giovanni Bellini (q. v.), whose best works consist chiefly of Madonnas and portraits, had already founded a great school at Venice, where, however, he was excelled by Carpaccio. Squarcione led a phalanx of notable painters at Padua, the chief among whom was Andrea Mantegna (q. v.), the founder of the school of Mantua and the greatest painter that had appeared hitherto in the N. of Italy. At Bologna, Francesco Raibolini,

commonly called Francia, and originally a goldsmith and niello engraver, had become greatly distinguished in 1490, and a vigorous school had also sprung up at Naples. Up to this point we have considered the development of the art of P. through all its earlier phases of development, and we now come to consider it as an art perfected in all essential principles by the splendid genius of Leonardo da Vinci, Michael Angelo, and Raphael. These men inaugurated a new era in P.—widened its bounds and enlarged its capabilities. Their immediate predecessors, the Quattrocentisti, had devoted their whole energies to the development of form exclusively; but the Cinquecento schools (16th c. men, or men who lived after 1500) opened up new ground, and while preserving the traditions of their predecessors added to the hitherto acknowledged canons of pictorial art the novel elements of *ideal selection* of form, dramatic composition, local colour, and light and shade—in other words, they rose to, and in their several ways perfected, the whole circle of qualities which constitute, and also limit, the art pictorial. Da Vinci's 'Last Supper,' painted at Milan in 1497, was the greatest work that had hitherto been produced in P. It was commenced, if not finished, nine years before Michael Angelo drew his famous 'Cartoon of Pisa,' eleven years before Raphael commenced the frescoes of the Vatican, and fifteen years before the completion of the ceiling of the Sistine Chapel by Michael Angelo. For a notice of the works and estimate of the genius of these great painters we refer to the separate articles BUONARROTTI, DA VINCI, RAPHAEL, merely remarking at this point in our historical survey that the last of the famous trio is by general consent regarded as the greatest painter of any age. The three achieved their greatest triumphs in Florence and in Rome; but in the meantime, the Renaissance of P. was evincing itself in the N., where Correggio (q. v.), the brilliant master of light and shade and of colour, and Parmegiano (q. v.), his most distinguished follower, gave birth to and conferred renown upon the schools of Lombardy. At the same period, the beginning of the 16th c., the great Venetian school rose into splendid fame; and in Giorgione (q. v.) and Titian (q. v.), the last great principle of the painter's art—local colouring—was brought to a perfection unsurpassed and unsurpassable. Other most distinguished members of the school of Titian were Pordenone, Paolo Veronese (q. v.), and Tintoretto (q. v.). But the 16th c., which saw the art of P. culminate in the schools of Florence, Rome, and Venice, saw also the commencement of its decline. Chief of the many imitators of Michael Angelo was Fra Sebastiano del Piombo, an excellent colourist, and one of the greatest portrait-painters of his own or any other age. 'There is probably no portrait in the world,' says Wornum, 'that can be compared for dignity and grandeur with the half-length figure by Sebastian of Andrea Doria, now in the Doria palace at Rome.' Other imitators of Michael Angelo were Daniele da Volterra, who died in 1567, and Vasari (q. v.), the historian of Italian art. Meantime successful artistic activity was being carried on in another part of the Italian peninsula, and a school was founded at Bologna by the Carracci (q. v.), the intention of which was, while rejecting the imperfections, to continue the merits of the various schools of Florence, Rome, Venice, &c. Before the Carracci rose into eminence, however, Bologna had had its famous schools. The first of these closed with Francia, whose works are the most perfect specimens extant of the quattrocento style of art, and who died in 1517. Bagnacarrolo, who asserted that more was to be learned from Raphael than from nature herself, and who died in 1542, was the founder of the second Bolognese school. Primaticcio (q. v.) and Pellegrino Tibaldi (q. v.), the former the founder of the French school of art, and the latter, called the *Reformed Michael Angelo*, the decorator of the Escorial in Spain, were the immediate precursors of the Carracci, who on their advent in Rome proceeded to establish what is known as the Eclectic or Academic style, and whose greatest pupils were Domenichino (q. v.), Guido (q. v.), Albani (q. v.), one of the first painters of 'cabinet' pictures, and Lanfranco. Following the early example of Titian and Giorgione, Annibale Carracci, and more especially Domenichino, paid great attention to landscape. These Carracceschi, who devoted themselves chiefly to external qualities and accessories, were opposed by the *Naturalisti* and *Machinisti*, among whom technical execution was regarded as the one thing admirable. The more famous of the Naturalisti were Caravaggio (q. v.), Spagnoletto (q. v.), and Guercino (q. v.). Salvator Rosa (q. v.) belongs to

the same period, and in some respects to the naturalistic school, but his genius is too unique for classification. The school is of special interest on account of the influence it exerted on the great Spanish painters. Other masters in the Roman school about the middle of the 17th c. were Andrea Sacchi, his pupils Carlo Maratta and the Frenchmen, Nicholas Poussin (q. v.), Gaspar Poussin (q. v.), and Claude Lorraine (see CLAUDE). N. Poussin's mythological and scriptural pictures are remarkable for their extensive landscape backgrounds. Claude and Gaspar, with widely conflicting ideas of the picturesque, were the painters who first gave themselves up entirely to the worship of nature. Maratta, regarded by many as the last of the great Roman painters, was succeeded by Bentoni and Mengs (q. v.). As a great art capital, Rome has in recent times become the seat of a French Academy and of a Spanish institution, to which Spain sends some ten or fifteen young artists at the public expense. The greatest modern painter associated with Rome was the Spaniard Fortuny (q. v.), the Romanticist, who died in 1874. Considerable sensation was caused by the exhibition at Rome of an ambitious and really great picture by Siemiradzki, a Polish artist, in 1876.

Painting in the N. and W. of Europe.—Of the history of P. in the nations of the N. and W. of Europe, it is impossible within our limits to speak separately. In these countries, down to the period of the decay of feudalism, P., like the other fine arts, was practically unknown, and when at the close of the Dark Ages commerce and the arts arose together, it was from Italy that the painters of the N. and W. derived their instruction and their inspiration. In all these countries the illumination of MSS. and the painting of missals was practised ages before Italian art came to maturity. Art in the N.W. of Europe can only be properly said to have begun with Hubert and Jan van Eyck, the founders of the Flemish school, in the latter part of the 14th c. The greatest successor of Jan van Eyck was Jan Memling (see MEMLING). The earliest distinguished painter of Holland was Dierick Stuerhout, a pupil of the Eycks. His two pictures painted in 1468, and which are in illustration of the Golden Legend (q. v.), are now in the royal collection at the Hague. Lucas van Leyden, one of the best of the old Dutch painters, was also a famous engraver, and his print called the *Eulenspiegel* is the rarest extant. Other Dutch painters of the Eyck school were Van der Goes, Kogier van der Weyden, Gossaert, and Mabuse. In Flanders the greatest painter of this age was Quentin Matsys, the smith of Antwerp (see MATSYS). Among the earliest German painters were Schaffer, Schön, and Wohlgemuth. Albrecht Dürer (see DÜRER) greatly advanced the art of P. and engraving in Germany in the beginning of the 16th c.; Cranach (q. v.) of Saxony, his contemporary, had a reputation almost equal to that of Dürer. The school founded by Dürer comprises Hans von Kulmbach, Schüßlefflin, Aldegraver, Beham, and the most original of all, Albert Altdorfer. Holbein (q. v.) is scarcely inferior in power to Dürer, while he was much more versatile, painting with equal readiness in oil, fresco, and distemper, subjects from history, portraits, miniatures, &c. In the 17th c. the chief German painters, mainly followers of the Dutch and Italian styles of the period, were Joachim von Sandart, Schönfeld, and Roos. Christian Rodé, Raphael Mengs, and Tischbein, are the most respectable names in the dreary 18th c. Angelica Kaufmann (q. v.), although German by birth, practised her art in England, and was one of the original members of the Royal Academy. The present century has seen a great revival in German art, and the rise of the celebrated romantic schools of Munich and Düsseldorf. (See CORNELIUS, SCHADOW, VEIT, OVERBECK, &c.) Among the greater modern painters are Kaulbach, Moritz von Schwind, Feuerbach, Hübner, Rethel, and Piloty. In Spain the development of P. was perhaps due, in the first instance, to the immigration of Flemish artists into the country, but was carried on and matured under the influence of Italians of the schools of Venice and Naples. Titian spent several years in Spain, and the Spanish artists travelled and studied in Italy. The principal Spanish artists are Antonio del Rincon, Luis de Vargas (q. v.), Morales (q. v.), Joanes, Cespedes, Roelas, Ribalta, Pacheco, Alonzo Cano, Velasquez (q. v.), Zurbaran, and Murillo (q. v.). Murillo and Velasquez stand out conspicuously as the greatest artists to whom Spain has given birth. In the Netherlands during the 17th c. art was gloriously upheld by Rubens (q. v.), Vandyck (q. v.), Snyder, Jordaens, D. Teniers the elder, and Diepenbeck (q. v.); and by Rembrandt

(q. v.), and his followers Gerard Dow, Eeckhout, Bol, and Hoogstraten. Throughout the 17th c. and later there appeared in the Netherlands a whole host of painters in *genre*, which has hence become almost synonymous with Dutch style. The chief of these were the Breughels, Jardin, Wouverman, Pieter de Hooghe, the Ostades, Paul Potter, Jan Steen, Teniers the younger, and Terburg. The principal landscape painters of this school were Bakhuizen, Vandevelde, Berchem, Jan Both, Albert Cuyp, Ruysdael, and Hobbema. The Flemish and Dutch schools produced only imitative and conventional work during the 18th c., but the former, greatly affected by French influence, has started to new and vigorous life within recent years. Besides Alfred Stevens, Knýt, and Florent Willems, settled in Paris, the more notable painters are Madou, Jean and Franz Verhaz, Winne, Van Severdonck, and the brothers Oyens. The modern 'Teruveren school' in landscape, founded by Hippolyte Boulenger (died 1876), comprises Coosemans, Dubois, Verwee, De Hass, and Montigny. Of living Dutch painters, perhaps the greatest are Josef Israels and Alma Tadema, the latter settled in England. In France the prevalent school of P. was derived from the Italian schools. N. Poussin gave a somewhat false character to the art of his country, which is perceptible almost to the present day. Eustache Lesueur (1617-55), called the French Raphael, approached the great Italian more nearly than any of his Italian imitators, in the character of his heads, his composition, draperies, &c. Charles Le Brun (1619-90) chiefly painted battle-pieces, and to this age belong Bourdon the landscape painter, and Bourguignon and Parrocel, famous for *genre* as well as battle-pieces; Hyacinth Pigaud, and Watteau (q. v.), perhaps the most famous of all. Gaspar Poussin and Claude Lorraine are to be regarded as Frenchmen, although classed among the painters of Rome. Of the 18th c. the chief French painters were Lemoine, whose fine 'Apothosis of Hercules' at Versailles contains one hundred and forty-two figures, and is the most magnificent monument of painting in France; Claude Vernet, a remarkable landscape painter; and Greuze (q. v.), famous in *genre*. Of the early part of the 19th c. the chief names are David (q. v.) and his followers Gros (q. v.), Girodet, Guérin (q. v.), Gérard (q. v.), and Géricault. Among the greatest ornaments in the modern Romantic school are Ary Scheffer, Paul Delaroche, Ingres, Delacroix, Vernet, unrivalled for battlefields, Rosa Bonheur for exquisite pictures of cattle and horses, and Troyon in landscape. Art in France has been more fertile in great names during the present century than ever before; and the country is famed for its treatment of landscape, and for the high technical skill of its painting. Among recent artists are Gerôme (q. v.), Meissonier, Doré (q. v.), Th. Rousseau, Diaz, Duverger, Billel, Jules Breton, Cavaillier, and Pils.

Painting in England.—Of the early English painters little is known with certainty. What is known as the English school is little more than a century old, and arose partly by the assistance of the foreign artists attracted to the English court, and partly in protest against these intruders. Jan Mabuse, a contemporary of Durer, painted the portraits of Henry VII. and his children. Holbein (q. v.) established himself at the court of Henry VIII., and Elizabeth also liberally patronised foreigners. In the reign of the latter, miniature P., for which the earliest English painters were justly celebrated, was practised by Nicholas Hilliard and Isaac Oliver. Charles I. was a liberal patron of the arts. Among the foreigners that were attracted to his court were Diepenbeck, Rubens, and Vandyck; while among the native artists of the same reign were George Jameson (q. v.), 'the Scottish Vandyck'; Walker and Dolson, portrait painters of great merit; and Stone, an excellent colourist who had long studied in Italy. In the following reign the prominent names are Verrio, Sir Peter Lely (q. v.), Gerard Zoult, and the two Van de Velde (famous marine painters), the only native artist of note being Samuel Cooper (born 1609, died 1672), who carried the art of miniature P. to its highest perfection. Of one of his miniatures Pepys says, it was 'done so admirably as I never saw anything.' The fact that Sir Godfrey Kneller (q. v.), Sir John Medina, and Jean Baptiste Monnoyer, flourished in the reign of William III. is sufficient proof that native art still lay in bondage. Of the age of George I. Walpole says, 'No reign, since the arts have been in any estimation, produced fewer works that will deserve the attention of posterity.' Jonathan Richardson, a good painter of a head, and, according to Wornum, the best art critic England has yet produced, and Sir John Thornhill, who decorated

the cupola of St. Paul's and the hall of Greenwich Hospital, were the chief native artists. Allan Ramsay (1709-84), painted portraits unaffectedly and with power. But the day of deliverance for British art had at last arrived, and William Hogarth (q. v.), the founder of the English school of P., rose into fame. He threw off the false traditions that had hitherto made British effort powerless; he laughed away the foreigners with the satire of his pen and pencil, he openly ridiculed the 'black masters,' as he called the manufactured, smoky counterfeits of ancient art with which the salerooms of London then abounded, and he took the liberty to think for himself. He himself says he 'grew so profane as to admire nature beyond the finest productions of art.' He revolted against the schools, and took his inspiration from nature at first hand. He was immediately followed by Sir Joshua Reynolds (q. v.), whose graceful composition, rich and mellow colour, and exquisite sense of beauty constitute him the English Titian. Then came in succession Gainsborough (q. v.), West (q. v.), Barry (q. v.), Copley (q. v.), and Romney (q. v.). Reynolds was worthily followed in portraiture by Gainsborough, who was equally great in portrait as in landscape art, and by Dance, Northcote, Opie (q. v.), and Sir Wm. Beechey (q. v.). Fuseli (q. v.), who found but a partial outlet for his genius in art, painted historical and imaginative subjects with wonderful power and suggestiveness, but with scant technical accomplishment. Stubbs, Gilpin, Morland (q. v.), Ward, and Landseer (q. v.), attained brilliant success as animal painters. Sir Thomas Lawrence (q. v.), Raeburn (q. v.), Hoppner, Owen, Martin Archer Shee (q. v.), Thomas Phillips (q. v.), Sir John Watson Gordon (q. v.), and Sir Francis Grant (q. v.), are among the great names as portrait painters. J. W. M. Turner (q. v.) made himself acknowledged as 'the greatest landscape painter of his own or any other age;' while in historical and poetical subjects, Howard, Haydon (q. v.), Etty (q. v.), Smirke, Eastlake (q. v.), and the Stothards (q. v.), attained distinction. In *genre*, Wilkie (q. v.), Mulready (q. v.), Bird (q. v.), Maclise (q. v.), Leslie, and Newton, prove that in imagination, humour, and general artistic skill the English school abounds in resource. Constable (q. v.), Copley Fielding (q. v.), Calcott (q. v.), Collins (q. v.), Naysmith (q. v.), Creswick (q. v.), Stansfield, James Ward, Birket Foster (q. v.), Linnell (q. v.), and Lee (q. v.), are classic names in English landscape. David Roberts (born at Edinburgh 1796, died 1864), is undoubtedly the greatest architectural painter that Britain has produced. Scotland may be said to have won a special place for itself in the present day by the vigour and variety of its landscape painting. Thomson of Duddingston was perhaps the first that displayed great genius in this branch of art. Since his time, Sir George Harvey (q. v.), Horatio Macculloch (q. v.), Sam Bough, Macwhirter, Waller Paton, Peter Graham, Colin Hunter, &c., have, either at home or in London, maintained or extended the reputation of their country. The pre-Raphaelite movement, which began about 1849, and was in the heyday of its activity from 1850 to 1860, was perhaps the most unique, powerful, and original impulse that English art ever received. Though it has now almost ceased as a movement, its influence continues to be seen even in the works of those who repudiate its principles. As a protest against conventionalism in idea and execution, it did an immense good. Millais (q. v.) was long its brilliant and daring head; even yet he is its greatest ornament, though no longer identified with its exclusive methods. Holman Hunt (q. v.) is still faithful to its traditions, and it numbers among its disciples such distinguished painters as Dante Rossetti (q. v.), Ford Madox-Brown (q. v.), Whistler, and Burne-Jones. Remarkable for the treatment, in widely differing styles, of figure-subjects, historical and imaginary, are Redgrave, Hamilton, Cope, Dyce (q. v.), Webster, Frith (q. v.), Ford, Leighton (q. v.), Poynter, and Armitage. Alma Tadema is celebrated for beautifully-finished classical pictures; Fildes, for pathetic scenes in humble life; Miss Thompson, who acquired such a sudden fame by her 'Roll-Call' in 1874, for vigorous, tragic battle-pieces. A record of modern art, however brief, would be incomplete without some mention of the wonderful originality and fecundity of our book-illustrators, of whom perhaps the greatest are Millais, Leech (q. v.), Poynter, Du Maurier, Tenniel (q. v.), Frederick Walker, Doyle (q. v.), and Keene. Besides landscape painters, Scotland has many sons who stand high in the art-annals of the country. David Scott (q. v.), 'imperiously original,' grappled with the most daring subjects, and showed a skill only inferior to his ambition. His masterpiece,

'Vasco da Gama encountering the Spirit of the Cape,' is at once grandly pictorial and intensely dramatic. Sir Noel Paton (q. v.) excels in fantastic allegory and fairy tale; Thomas Faed (q. v.) in the delineation of the varying phases of rustic Scottish life. The historical pictures of James Drummond (died 1877) are equally remarkable for their dramatic power and fidelity to circumstance. The reputation of Scottish portrait-painting is at present well sustained by Sir Daniel Macnee, R. Herdman, and Norman Macbeth. Other eminent Scottish painters are Erskine Nicol (q. v.), the Burrs, Orchardson (q. v.), James Archer, Hugh Cameron, M. Taggart, Chalmers, &c.

Water-colour drawing had its origin in the humbler art of the topographer, and began with the tinted representations of antiquarian remains and ancient buildings, and was mainly the offspring of the antiquarianism of the latter part of the last century. The first specimens of the art were careful outline drawings, often finished with the pen, the light and shade being put in in black or grey. Afterwards tints of transparent washes were put in to indicate the local colour of the objects or scenery. The vital undying principle of water-colour drawing was that it necessitated constant reference to nature, and the progress of the art, which is a specially English one, has been carried to a perfection in England undreamt of abroad, and has for that reason been astonishingly rapid. Another reason for its progress here is that this form of art is peculiarly adapted for landscape—for the representation of verdure, foliage, air, distance, mists, and all atmospheric effects; and the climate of Britain, dewy, humid, haunted with cloud and mist-drift, while producing a freshness of verdure which is the wonder of foreigners, offers the best possible facilities for the exercise of this form of P. M. Rouquet, writing in 1755 says, 'Those who excel in landscape P. in England ought to excel all others, as nothing can be so charming as the verdure in that country.' John Cozens, toward the close of the last century, made a great advance in the art of water-colour P., by using a variety of positive, yet transparent colours. Thomas Girtin (born 1773), the first great water-colourist, made a great impression in his day by his bold and vigorous manner. But the full development of water-colour P. is due to Turner, who has raised this form of art to a level with oil P. David Cox (1783-1859), is famous for his shifting aerial effects and transient aspects of English scenery. Ruskin says his foliage is 'altogether exquisite in its impressions of coolness, shade, and mass.' Frederick Walker (died 1875), and G. J. Pinwell (died 1876), both possessed of rare imaginative power, are among the most distinguished of recent English painters in water-colour. See the works of Waagen (q. v.), R. N. Wornum, *The Epochs of P.* (Lond. 1847); Crowe and Cavalcaselle, *The History of P. in Italy* (Lond. 1864); Richard and Samuel Redgrave, *A Century of Painters of the English School*; Professor George Barnard, *Landscape P. in Water-Colours*; Kugler, *Handbook of P., Italian Schools of P.*, edited by Eastlake (1855); his *German, Flemish, and Dutch Schools*, edited by Sir Edmund Head (1846; new ed. by Crowe, 1875); *Spanish Schools and French Schools* (1848); Ruskin, *Modern Painters* (1843-60); W. B. Scott, *Half Hour Lectures on the History and Practice of the Fine and Ornamental Arts* (3d ed. 1874); and Mrs. Charles Heaton, *A Concise History of P.* (Lond. 1877).

Painting, House. This industrial art is concerned with the covering of wood, plaster, and iron-work in various parts of a building with liquid substances, which harden and resist atmospheric influences, mainly for protection from decay, but also for cleanliness and ornament. Besides plain painting, *graining* and *marbling*, by which imitations of fancy woods and marbles are produced, are branches of H. P., while *ornamental H. P.* deals with stencilling, and the painting of decorative designs on plain-painted walls, ceilings, &c., work which requires much artistic skill. The paints employed consist chiefly of white lead or zinc white, mixed up with linseed oil, and stained to the colour required. (See PAINTS and PIGMENTS.) In a few fancy colours, and sometimes in the finishing coats of ordinary work, the white base is left out. Turpentine is often mixed with the linseed oil, and when the work is to be finished without gloss the paint for the last or flattening coat, is wholly thinned with turpentine. To cause the paint to dry quickly, substances called *driers* are added; these embrace litharge, sugar-of-lead, and occasionally Japan varnish. To new wood and plaster-work four or five coats of paint are applied, while for old work two coats are con-

sidered sufficient after dirt and grease are got rid of. Knots in wood are cut out, when bad, and replaced by new wood, or else covered with a composition of red lead; nail holes are stopped with putty, and in general all roughness is removed by the use of pumice stone. For *distemper*, the colours are mixed with size and diluted with water. It is chiefly used for ceilings. In graining, thick oil colour is applied over a prepared surface, and by means of brushes of different kinds, metal combs (for wainscot alone), sponges, and pieces of soft leather, the veins, knots, &c., peculiar to the various fancy woods are closely imitated. Grained work is subsequently varnished. Imitation marbles have the ground prepared of the colour predominant in the natural stone, and the veins are represented by other colours, blended and softened with brushes, the whole being varnished when dry.

Paints or Pigments are the insoluble, generally coloured, substances used to form a preservative coating on wood, stone, and metal work, &c., for decorating surfaces, and for producing pictorial effects. The term paint is generally restricted to colours mixed with oil, and prepared for the use of artisan painters; pigments, on the other hand, embrace these and the colours used by artists, those applied in the decoration of pottery and porcelain, and a certain proportion of the substances used in calico printing. P. and P. are most largely derived from the mineral kingdom, but some are of vegetable origin, and a few are produced by the animal kingdom. Many of these, of mineral origin, are highly poisonous, and require to be treated with care in their preparation and use, and especially the arsenical lead and copper colours, which are all of great importance, require to be ground and prepared with great caution. P. and P., for the most part, must undergo a process of grinding to prepare them for use, and that operation, on a large scale, is performed in a colour-mill, which consists essentially of a pair of millstones of cast-iron, grooved and channelled like the stones of an ordinary flour-mill. In the colour-mill the paint is ground up with a sufficient amount of oil to form a stiff uniform paste as it is delivered, and in the case of colours, which are required in a state of very fine division, the pasty mass is afterwards passed between steel rollers set very close to each other. The basis of most of the artisans' paints consists of white lead, to which colouring matters are added, and in the following list are enumerated or indicated the principal painters' colours either used to colour white lead, or by themselves as substantive paints. (1.) *Native mineral colours*.—Italian and other ochres, Terra de Sienna, raw and burnt; Vandyke brown, Sardinian earth, Turkey umber, raw and burnt; oxide of iron, various shades; Indian red, Turkey red, Venetian red, English umber, and siliceous deposits. (2.) *Lakes* (q. v.), crimson, scarlet, purple, light and deep; Hungarian, Victoria maroon; green, dark and light; vermilion, pale and deep. (3.) *Miscellaneous colours*, chiefly artificially prepared from mineral substances, including numerous pigments, which will be found specified according to their colours under the various headings—black, blue, green, red, &c.

Paisiello, Giovanni, a prolific Italian composer, was born at Taranto, May 9, 1741. While a pupil of Durante at the Conservatorio di S. Onofrio, Naples, he distinguished himself by the composition of Church music. His first opera, *La Pupilla*, was produced at the Marsigli Theatre, Bologna, in 1763, and during the next fourteen years he produced no fewer than fifty-one similar works. On the invitation of Catherine II. he went to St. Petersburg in 1777, where he remained for eight years, and where he composed several operas, including *Il Barbiere di Siviglia*, many sonatas, cantatas, &c. He produced the opera *Il Passione* at Warsaw, and twelve orchestral symphonies at Vienna in 1785. He next resided for a number of years at Naples, where he brought out three of his best operas, *La Molinara*, *I Zingari*, and *La Nina*. A funeral march he composed on the death of General Hoche attracted the notice of Napoleon, who summoned him to Paris, appointed him director of music in his chapel, and loaded him with honours. In 1805 he returned in receipt of a pension to Naples, where he died in 1816. P.'s works include ninety-four operas, many minor stage pieces and ballets, thirty-nine masses, a multitude of sacred pieces, and much instrumental music. He excelled in comic opera, and had a fresh and buoyant style.

Paisley, an important industrial town in the county of Renfrew, Scotland, on both sides of the Cart, 3 miles above

its entrance into the Clyde, and 7 miles W.S.W. of Glasgow by rail. It is the junction of the Glasgow and South-Western and Glasgow and Greenock railways, and is also connected with the royal burgh of Renfrew and the river Clyde by a branch line from the Glasgow and Paisley joint railway. The river Cart is navigable to the town for vessels drawing 8 feet of water, and along its banks shipbuilding to a considerable extent is carried on. P. consists of an old and a new town, the former situated on and around a hilly ridge on the W. bank of the Cart, and commanding extensive views, the latter is built on a regular plan and on a level site. The Cart is crossed by the railway viaduct and three stone bridges. Adjoining both old and new town are extensive suburbs. The principal modern buildings are the castellated county buildings and prison, erected in 1818 at a cost of £40,000, and extended since at a cost of £15,000, comprising a court-house, council chamber, county hall, jail, and various public offices; the John Neilson educational institution, surmounted by a dome visible from all parts of the town; a grammar school in Gothic style, erected in 1864; and numerous banking offices. A recreation ground, called the Fountain Gardens, gifted to the town by Mr. Thomas Coats of Ferguslee, was opened in 1868, and his brother, Sir Peter Coats, erected a very chaste and elegant structure for a library and museum and presented it to the inhabitants in 1870. The library is supported by a rate under the Free Libraries' Act, and is extensively used. The late George A. Clark bequeathed a sum of £20,000 for erecting a town hall, which sum his brothers have supplemented by an additional £30,000, and an imposing edifice in the Classic style is now (1878) commenced. The late Robert Brodie of Carraighill left his property, consisting of about 24 acres, for a public park, which has been laid out and planted by the corporation at a cost of £3000, and was opened to the public in the summer of 1877. Mr. Duncan Wright of Alticry, a native of the town, conveyed his estates of Upper and Nether Carswell to trustees to form the 'Duncan Wright educational endowment,' which yields about £450 annually, one-fourth of which is devoted to school bursaries varying from £5 to £10 each, and the remaining three-fourths to college bursaries of £25 each, tenable in both cases for four years. The staple manufactures of P. have varied greatly. In the beginning of the 18th c. they were coarse and chequered linen cloths, and these were supplanted by chequered linen handkerchiefs and striped muslins, called 'Bengals.' Subsequently lighter articles were introduced, such as plain and richly figured lawns, sewing-thread, &c. The manufacture of lawns had increased at the end of last century to the yearly value of £165,000, that of thread to £60,000. The former is now extinct, while the latter has been exchanged for cotton thread, the production of which has become the largest industry in the town. About 350,000 spindles are (1878) engaged in it by two large and five smaller firms. From 6500 to 7000 workers are employed in the thread factories, 90 per cent. of whom are females, and the estimated annual value of the manufacture is very nearly £1,500,000. About the middle of the 18th c. the silk gauze industry was begun, and was prosecuted with such energy that P. soon surpassed Spitalfields in the richness and variety of its silk goods, which supplied various Continental cities, including Paris, and amounted in value to £350,000 yearly. This industry, although it has declined, is still of importance. The manufacture of muslin, formerly extensive, has been transferred to Glasgow. At present (1878) the staple textile manufactures are shawls of silk and cotton, and silk and cotton mixed, and 'Cachmere' shawls of fine wool, the wool being expressly imported from Germany and Australia; woollen scarfs, ladies' dresses, and woollen piece-goods, and tartans for mantles and dresses. The shawl trade culminated about a quarter of a century ago, when its annual value was estimated at £1,000,000 sterling. The manufacture of tapestry has been lately introduced, and employs from 150 to 200 looms. Carpets are also extensively manufactured in the town and suburbs. Other industrial products are soap, starch, corn flour, and chemicals. There are also large dye and print works, power-loom factories, tanneries, bleachfields, and engineering works. Horse races have been held here since 1608, and take place on St. James's Day. P. sends one member to Parliament. Pop. (1871) 48,257; estimated (1878) at 51,000. Wilson the ornithologist, Tannahill, and John Wilson (Christopher North) were born in P. A bronze statue of the ornithologist and a monument to Tannahill have been erected within the past few years.

The *Abbey of P.* was founded in 1169 by Walter, son of Alan, the first Stewart of Scotland. He established at P. a colony of monks of the order of Clugny, whom he brought from the priory of Wenlock in Shropshire. The abbey was largely endowed by Walter and his descendants with lands and churches, chiefly in the counties of Renfrew and Dumbarton. It was dedicated to the Virgin, St. James, St. Mirin, and St. Milburgha. St. Mirin was a missionary from Banchor in Ireland, who first preached Christianity in the neighbourhood of P. St. Milburgha was the patron saint of Wenlock. The abbey was the burying-place of the Stewarts until their accession to the throne of Scotland. King Robert III. was also buried there before the high altar. Many of the abbots—who were mitred—were eminent as statesmen. The last Abbot of P. was John Hamilton, Archbishop of St. Andrews. In 1553 his nephew, Claud Hamilton, a boy of ten, was made abbot *in commendam*. After the Reformation his commendatorship was ratified by the crown, and the temporalities of the abbey were erected into a barony in his favour, and his son was created Earl of Abercorn. The abbey was burnt by the English in 1507, during the war of independence. It suffered greatly in the commotions connected with the Reformation, and was burnt a second time by Lord Glencairn and his followers in 1561. The nave of the church is still in good preservation, and is used as a place of worship. A chapel, dedicated to St. Mirin, and forming part of the transept, is also entire. The remainder of the transept and the choir are unroofed, and used as a burying ground. The nave is as fine a specimen of Pre-reformation architecture as any in Scotland. Its style in general is Early English. It has both triforium and clerestory. There are several sculptures and monuments of interest in different parts of the building. In the centre of St. Mirin's chapel there is an altar tomb of very beautiful workmanship, popularly supposed to have been erected to Marjory, daughter of Robert the Bruce. A series of sculptures representing incidents in the life of St. Mirin are in the same chapel, and are of a very remarkable character. This part of the building is called the 'sounding aisle,' owing to a wonderful echo in it. None of the monastic buildings remain. See the Rev. Dr. Lees' *History of the Abbey of P.* (Gardner, Paisley, 1878).

Palace. See PALATINE HILL.

Palacký, František, the founder of the historical school in Bohemia, was born at Hodslavice in Moravia, June 14, 1798. Educated at Trentschin and Pressburg, he commenced his literary career by translations from Ossian (1817), which were followed by *Anfangsgründe der Böhmisches Dichtkunst* (Pres. 1818), *Theorie des Schönen* (1821), and *Allgemeine Geschichte der Aesthetik* (1823). His appointment as tutor to the family of Graf Chotek in Prague (1823) gave him entrance to the circles of the nobility, where he strove thenceforth to rekindle the spirit of Czech nationality. In 1824 P. founded the *Matice Czeská*, a society for the publication of a native literature; from 1827 to 1838 he edited the *Magazine of the Bohemian Museum*, in Czech instead of German as heretofore; and during this period commenced his *Geschichte Böhmens* (6 vols. Prague, 1836-73; Czech edit. 3 vols. 1848-57), which gained for him the title of Historiographer to the Estates of Bohemia (1839). He appeared as head of the Bohemian Opposition in 1848, and again in 1860, but in 1872 withdrew from public though not from literary life, his *Politische Testament* (1874) upholding Pan-Slavism with Bohemia as its centre, and denouncing the falseness of the German race. P. died at Prague, May 26, 1876. Amongst his other writings are *Die ältesten Denkmäler der Böhmisches Sprache* (1840), *Der Mongolen Einfall im Jahre 1241* (1842), and *Urkundlichen Beiträge zur Geschichte der Hussitenkriege* (2 vols. 1873).

Paladin (Ital. *paladino*), originally a *Comes Palatii* or Count (q. v.) of the Palace, then one of Charlemagne's peers, as Roland or Oliver; and lastly, in the Italian romances of the later Middle Ages, a knight-errant generally.

Paleography (Gr. *palaïos*, 'old,' and *graphō*, 'writing') is the science of at once deciphering ancient documents and determining their date, origin, and the circumstances under which they were written, by such external and internal evidence as materials (paper, parchment, &c.), handwriting (initials, abbreviations, &c.), orthography, vocabulary, and subject-matter. The importance of such a science has been shown in the case of the Ireland and Chatterton forgeries, and more recently in that of the *Oera Linda Book* (Amst. 1872; Eng. edit. and trans. Lond.

1876). This work, purporting to be a 13th c. transcript of an old Frisian MS. of far higher antiquity, imposed for a time on some of the ablest living scholars, but has now been conclusively proved to have been written by one Gerrit Over de Linde, who died in 1873. The cotton paper of this MS., to which the editor, Dr. Ottema, drew especial attention as being clearly of a date prior to 1256, was declared by Frederik Müller, an eminent antiquarian bookseller, to be of modern Maastricht manufacture, whereas in reality it was brought from China by the seafaring author of the *Oera Linda*. Here we see the caution that must be exercised by paleographers. Of works upon the subject may be noticed the writings of Mabillon, the founder of the science; of Montfaucon, Muratori, Champollion-Figeac, and Tischendorf, Bast's *Commentatio Palaeographica* (Leips. 1811), Natalis de Wailly's *Éléments de Paléographie* (2 vols. Par. 1838), Silvestre's *Paléographie Universelle* (5 vols. Par. 1839-45), Westwood's *Palaeographia Sacra Pictoria* (1845), W. Forsyth's *History of Ancient Manuscripts*, and Wattenbach's *Anleitung zur Griech. Paläographie* (Berl. 1867), and *Anleitung zur Lat. Paläographie* (Leipzig. 1869). See MANUSCRIPTS, CONTRACTIONS, and PALIMPSEST.

Palaolithic (Gr. *palaïos*, 'old,' and *lithos*, 'a stone'), the name applied to the races of men that existed in the Post-pliocene age. The absence of metals and the presence of stone implements in deposits of this age indicate a very primitive state. P. man was a contemporary of the Mammoth (q. v.) and other species of extinct mammals.

Palaeologus Constantinus XIII., surnamed *Dra-gases*, the 7th emperor of the dynasty of P., and last of the Byzantine Empire, the 4th son of Manuel II., was born in 1394, and called to the throne by the voice of the people on the death of his brother, Joannes VII., in 1448. He hesitated long to accept a crown which he feared he could not maintain against the Turks, by whose ravages the empire had been reduced to the city of Constantinople and a few places among the islands of Greece. His reign was tranquil until the death of the Sultan, Amurath II., and the accession of his ambitious son Mohammed II., who, however, concealed his intentions until he had completed his preparations. He appeared before the walls of Constantinople, 6th April 1453, at the head of 258,000 men, against whom P. could only oppose an army of irresolute Greeks, aided by Genoese and Venetian mercenaries. The city was taken by storm on the 29th May, and P. fell fighting bravely in the breach amidst a crowd of Janissaries. His body was afterwards discovered, and his head cut off and nailed on the porphyry column in the Augusteum, but was afterwards sent round as a trophy to the principal cities of Asia Minor. See Gibbon's *Decline and Fall of the Roman Empire*.

Palaenioniscus (Gr. *palaïos*, 'old,' and *oniskos*, a 'sea-fish'), a genus of extinct ganoid fishes, the remains of which are common in Carboniferous and Permian rocks. The tail is markedly heterocercal, and the teeth are minute and numerous. P. died out in the Triassic period. The genus is included in the family *Lepidosteidae*, or that represented by the existing *Lepidosteus osseus*, or bony pike of N. America. Its members have well-developed scales of rhomboidal shape, but not overlapping each other.

Palaontology (Gr. *palaïos*, 'old,' *ont-*, 'being,' and *logos*, 'discourse,' 'science'), the division of geological science that deals with the determination of the nature and affinities of fossil organisms, with the manner of their preservation, and with the general range and development of animal and plant life in past periods of the earth's history. P. is in fact the botany and zoology of the past. It deals with the *distribution in time* of living organisms, and seeks to construct a record of the ancient life-history of the globe. P. is usually ranked as a branch of geology. That this latter idea is correct is evident from the consideration that not only are the objects which the palaontologist studies derived from the domain of the geologist, but the results of palaontological study serve to elucidate points of material interest in geology, and also aid in the determination of many problems connected with the age, &c., of rocks. The term 'fossil' may be first defined, as it lies at the foundation of the study of P. A *fossil* is the trace of the existence of any living being preserved in the earth. It does not matter whether the fossil is only a fragment of the organism, or has been

much altered by preservation in the earth, or is but little changed from its original state. All such terms as 'sub-fossil,' 'semi-fossil,' and the like, are inexpedient and useless. The merest fragment of a living organism may sometimes suffice for the determination of its characters. Thus a fragment of a tooth may give the paleontologist a definite knowledge of the creature from which it was derived; since from his acquaintance with living animals he is enabled to relate the fossil organism to its nearest living representatives. A fragment of the occipital bone of a mammal, bearing the condyles or articular processes for articulation with the spine, would enable the paleontologist to express a definite opinion regarding the nature of the animal, and to postulate certain characters which he knows invariably accompany the presence of a well-ossified occipital bone with two condyles.

Fossils present themselves under three or four leading forms. The most perfect fossils are those in which the actual organism has been preserved. Fossil skeletons exemplify this first group—the paleontologist dealing with the actual structures which have been petrified and preserved through the infiltration of mineral matter. Trunks of trees and other parts of plants, fishes, shells, &c., may be similarly preserved in this way. A second group of fossils is that in which external or internal casts or moulds of the organisms are found. A shell originally falling into a soft deposit—which, through consolidation, ultimately becomes a solid rock—will be filled up by the soft material of the deposit. This matter becoming hardened, will form a solid cast of the inside of the shell; and if we suppose that the shell itself becomes dissolved by chemical action, the internal cast will remain, and will give an accurate idea of the form of the shell, whilst an *external* cast would also be formed through the pressure of the shell against the clay or other matter which immediately surrounded it. In reference to the complete and perfect preservation of such organisms as bones, teeth, trees, &c., it may be remarked that in many cases the most delicate portions and most minute structure of the preserved organisms may be made apparent by microscopic examination. The fact that microscopic sections may be made of fossil structures has had a most important bearing on the determination of the nature of many fossil structures. Thus the affinities of many fossil plants have been determined from microscopic structure alone; and tooth-like structures (such as those found in the jaws of certain bird-fossils—e.g., *Odontopteryx*), have been ascertained to be bony or osseous in their nature, and to exhibit no structural affinities with true teeth.

Certain broad generalisations are deducible from the casual study of P. (1) It may readily be imagined that it is the *hard parts* of animals and plants which alone possess any definite chance of being preserved in a fossil state. On this account, or rather from the converse reason of their softness, many groups of animals are utterly unknown in a fossil state. Such are the sea-squirrels or *Tunicata*, the jelly-fishes, &c.; although, strange to say, there have been found in the Lithographic Slates of Solenhofen in Bavaria impressions of jelly-fishes which had fallen upon the mud of that deposit when in a soft and plastic condition. (2) It is evident that the only rocks in which fossils can occur are the *Aqueous* or *Sedimentary* formations. These rocks, being formed in water, of necessity receive, along with the materials derived from the land, the bodies of land-organisms; while those of water-living species will similarly fall into the deposits when such species die. No fossils are found in *Igneous* or fire-formed rocks, the circumstances of formation of such rocks precluding the possibility of organisms being preserved in such formations. And in the so-called *Metamorphic* rocks traces of fossils are not common; the changes to which these rocks have been subjected having in all probability destroyed the fossils they may originally have contained. (3) The nature of the fossils included in a rock or rock-system affords a clue to the exact nature of the formation. Thus, if shells of marine species be found as fossils in any particular formation, such a deposit may be regarded as having been of marine origin, and as having been formed from sediment deposited in the sea-bed. If, on the contrary, shells found only in fresh waters are discovered as characteristic fossils of any particular formations, its origin as a lake-deposit may be postulated; and the presence of shells known to inhabit brackish waters would similarly indicate the estuarine nature of the formation. (4) A test of the relative ages and order of formation of the

various rock-systems may be found in the history of their fossil contents. When a series of fossils can be shown to be characteristic of any particular formation, and to be limited in its range to such formations, we may deduce the conclusion that widely separated rocks which present a similar assemblage of fossils may be *contemporaneous* with the first beds or strata, although the subject of contemporaneity of strata is a very difficult and undetermined one at present. Certain groups of fossils, moreover, are found to be specially limited to certain rocks. Thus the *Graptolites* (q. v.) are found only in Silurian rocks. The discovery of a single graptolite would therefore at once indicate that the rock from which it was obtained was of Silurian age. And it could even be shown that certain *genera* or kinds of these organisms are limited exclusively to certain beds of Silurian age. These conclusions are founded on data discovered through investigation. They are, as far as they go, tolerably certain, but like every other fact of observation, they are liable to be modified by the progress of research.

The age and order of the rock-systems, as defined by the test of *superposition* and by the combined organic remains, may be stated as follows, beginning with the oldest series:—

Laurentian, Huronian, Cambrian, Silurian, Devonian or Old Red Sandstone, Carboniferous, Permian, Triassic, Oolitic or Jurassic, Cretaceous, Eocene, Miocene, Pliocene, Post-Tertiary or Recent,	<p>} Palæozoic, or 'Ancient Life' Epoch.</p> <p>} Mesozoic, or 'Middle Life' Epoch.</p> <p>} Kainozoic, or 'Recent Life' Epoch.</p>
--	---

The stratified or aqueous rocks are thus arranged, as will be seen from the table, in three well-marked 'epochs.' Of these, the oldest or Palæozoic (beginning with the Laurentian and ending with the Permian rocks) is characterised by the general dissimilarity existing between its fossils and existing animals and plants. Most of the Palæozoic fossils belong to extinct species. In the Mesozoic rocks, which include the Trias, Oolite, and Chalk, the fossils include many extinct types, but evince as a whole a much nearer approach to living species than those of the Palæozoic Epoch; while in the Kainozoic Epoch the fossils mostly belong to living species, or to species that have only 'recently' become extinct.

It may be noted, by way of conclusion to these general observations on P., that the record of life in the past is by no means of perfect or continuous nature. On the contrary, very many serious gaps occur in our knowledge of the succession of life on the globe, and 'the imperfection of the geological record,' as Darwin terms it, is likely to remain a permanent stumbling-block in the way of settling certain aspects of the evolution theory. There can be little doubt, however, that life has been developed upon the earth's surface in a gradual fashion and in an ascending scale. Thus, in the oldest series of rocks, the remains of the lowest organisms only are found; while higher forms of life make their appearance as we advance to more recent deposits. In the Laurentian and Cambrian rocks the chief fossils consist of the famous *Eozoön* (q. v.) or 'Dawn of Life' animalcule; a giant *Foraminifer* (q. v.). In the Lower Cambrian, burrows and tracks of marine worms occur; traces of a supposed Trilobite (*Palæopyge*) (q. v.) are found, and various organisms (*Oldhamia*) (q. v.), &c., which may either be plants or zoophytes, also occur. The Upper Cambrian rocks teem with the remains of Trilobites (q. v.), of marine plants, of Brachiopods (q. v.), &c. The Silurian formations have fossil brachiopods in plenty, sponges, marine plants, graptolites, echinoderms, worm-burrows, trilobites; mollusca (gasteropods, cephalopods, &c.), and fish remains. In the Devonian rocks ganoid fish-remains occur. Corals, echinoderms, sponges, crustaceans, and insects are also found, and the plants indicate the beginning of the luxuriant vegetation of the Coal Epoch which followed. In the Carboniferous series, the characteristic 'Coal Plants' occur, together with sponges, corals, echinoderms, annelids, crustacea, polyzoa in abundance, fishes, amphibians, and probably a few reptiles; the Permian rocks in addition containing true reptilian remains. The Triassic has many characteristic plant-fossils and abundant molluscs; while reptilian remains are common, and birds have

a doubtful place. In the Triassic, however, the first remains of mammals are found. The Jurassic or Oolitic rocks resemble the Triassic closely, but contain an enormous development of reptilian life. One bird (*Archæopteryx*) occurs as a fossil in these rocks, and the mammals are more numerous than in the Triassic. The Chalk is celebrated for its *Foraminiferous* remains and for its sponges, echinoderms, polyzoa, and cephalopods—the latter being very numerous. Bird-fossils occur in rocks of Cretaceous age in America. The Eocene is rich in vertebrate fossils. Its birds are numerous and its mammals plentiful; and through the succeeding strata the number of species allied to living groups increase in numbers; traces of man's handiwork first appearing during the Post-Pliocene Period, when the mammoth, woolly rhinoceros, cave bears, lions, tigers, &c., also existed.

Palæ'ophis (Gr. *palaïos*, 'old,' and *ophis*, 'a serpent'), a genus of serpents, the fossil remains of which are found in rocks of Tertiary age in the United States, and in rocks of a similar age in Britain. *P. typhæus* occurs in the Eocene beds of Bracklesham. Another species (*P. foliapius*) has been found in the London clay of Sheppey, and is the oldest known example of a fossil snake.

Palæopt'eria (Gr. *palaïos*, 'old,' and *pteria*, 'a fern'), a genus of fossil ferns, highly characteristic of the Carboniferous period. *P.* was one of the so-called tree-like or arborescent ferns, and presents, along with such genera as *Caulopteris* and *Psaronius*, a striking resemblance to the tree-ferns found in New Zealand at the present day.

Palæopy'ge (Gr. *palaïos*, 'old,' and *pūgē*, 'the rump'), a genus of extinct Crustaceans, the fossil remains of which occur in the Lower Cambrian formations. *P.* is usually regarded as a *Trilobite* (q. v.), or as nearly related to one. *P. Ramsayi* is the representative species. From the fragmentary and incomplete nature of the fossil, its exact nature is difficult to determine.

Palæosau'rus (Gr. *palaïos*, 'old,' and *sauros*, 'a lizard'), a genus of fossil reptiles, allied in some respects to the *Crocodylia*, but regarded as sufficiently distinct from that group to warrant its being classified with the so-called *Thecodont* reptilia of Owen, or with the *Dinosauria* of other writers. The remains of *P.* occur in 'dolomitic conglomerate' formations near Bristol, the age of these formations being either Permian or Triassic. The vertebrae in *P.* are *amphicelous*, that is, are concave at either end; this disposition indicating a mobility of the spine such as is seen in fishes. The ribs were long and bent, and the femur or thigh had a third trochanter. The *P.* had also well-developed teeth, springing from distinct sockets.

Palæother'ium (Gr. *palaïos*, 'old,' and *thērion*, 'a wild beast'), a fossil genus of quadrupeds, allied to the living tapirs. The remains of species of *P.* occur in the Eocene and Miocene rocks of the Tertiary period. All the feet had three toes. The teeth comprised six incisors, two canines, eight premolars, and six molars in each jaw. The canine teeth were longer than the others. *P. magnum* is a familiar species. The *P.* varied in size from a sheep to a horse or cow. In all probability it had a short trunk or proboscis, was herbivorous in its food, and inhabited marshy lands and swamps.

Palæozo'ic. See PALÆONTOLOGY.

Palafox y Melzi, José de, Duke of Saragossa, a famous Spanish General, was born at the Castle of Palafox, Aragon, in 1780. He accompanied Ferdinand VII. to Bayonne, but, on the latter being taken prisoner, fled to Saragossa, by his gallant defence of which town against the French he has gained for himself a historic reputation. Forced at length to capitulate, *P.* was taken to France and imprisoned for four years in Vincennes. On the conclusion of the Treaty of Valençay, in 1813, he returned to Spain, where from 1814-20 he rendered valuable service as Commander-General of Aragon in suppressing various rebellions. After the death of Ferdinand he attached himself to the party of the Christinos, and was created in 1836 Duke of Saragossa and grandee of Spain of the first order by the Queen-Regent Marie Christine. After this he avoided mixing in politics, and died at Madrid, 16th February 1847.

Palais Royal, a pile of buildings in Paris, now comprising a palace, a theatre, and many brilliant shops and *cafés*. The old palace, originally called the Palais Cardinal, was built (1624-36)

by Mithelieu, who bequeathed it to Louis XIII., on account of whose occupancy it received its present name. It was given by Louis XIV. to his nephew Philippe, Duc d'Orléans, and became the town residence of the Orléans family. A centre of the gaiety and vice of the pre-Revolution period, it was converted by Philippe Egalité into the chief rendezvous of the revolutionary schemers and demagogues. Confiscated by the Republic in 1793, it was used for the sittings of the tribunals during the Reign of Terror. After serving as the residence of Louis-Philippe from 1814 to 1831, it was greatly damaged during the Revolution of 1848. Under the Second Empire it became the residence of Jerome Bonaparte and his son Prince Napoleon. The buildings were set fire to by the Communists in May 1871, and received much injury, but have been restored since 1873. The garden in the second court, or Cour Royale, measures 700 by 300 feet, and is beautifully laid out in avenues and parterres, and adorned with fountains. On one side is the Théâtre Français, and facing it is the famous Galerie Vitree ('glass gallery') chiefly occupied by the *cafés*.

Palamcott'ah, a town in the district of Tinnevely, Madras Presidency, British India, 49 miles N. of Cape Comorin. Pop. (1871) 17,945. It contains the cantonments of a native infantry regiment, and lies a mile S.E. of the civil station of Tinnevely.

Palampore, a town in the district of Kangra, Punjab, British India, among the lower slopes in the Himalayas, 317 miles S. by mountain passes from the commercial centre of Leh in Cashmere. A fair was established here in 1867, to develop local trade and promote intercourse with Central Asia. In November 1871 it was attended by Lord Mayo. 30,000 people are sometimes present, and goods sold to the value of £30,000. English cloth, metal ware and ornaments are exchanged for shawl wool, ponies, borax, musk, and gold. *P.* is also a centre of tea-planting industry under European supervision.

Palanqueen (Port.; Javanese, *palangki*; Hindust. *pālti*), the well-known Indian conveyance, consisting of an oblong box, in which the traveller reclines on a mattress, &c., attached in its framework to a pole, borne on the necks of at least no less than four bearers, whose monotonous chaunt can never be forgotten by those who have once heard it. The natives use similar conveyances, more or less ornamented, especially for marriage processions; but the *P.* proper was essentially for European use, and the introduction of railways and the adaptation of roads for wheeled traffic have considerably promoted its discontinuance.

Palap'teryx (Gr. *palaïos*, 'old,' and *apteryx*, 'the wingless'), a genus of fossil New Zealand birds belonging to the struthious family *Dinornithidae*, and distinguished from the typical Moas (see DINORNIS) by the presence of a back toe. Three species are known.

Palate (Lat. *palatum*, probably allied to *pasce*, 'to feed'), the term used to denote the roof of the mouth. Anatomically, the *P.* is divided into the *hard* and the *soft*. The former is situated in the front, and the latter in the hinder part of the mouth. The hard *P.* is bounded in front and at the sides by the sockets of the teeth, while behind it becomes continuous with the soft *P.* It is covered by the mucous membrane of the mouth, which is closely united to the *periosteum*, or membrane investing the bone. The mucous membrane of the *P.* is provided with numerous mucous glands, and is covered with *squamous* or *pavement epithelium*. The soft *P.* is anatomically known as the *velum pendulum palati*. It is a movable fold of mucous membrane, forming a kind of curtain or partition between the mouth and the *pharynx*. Its anterior surface is concave in its undisturbed state; its hinder surface convex, and continuous with the mucous membrane lining the *posterior nares* or hinder nostrils. It is attached by its upper border to the hard *P.* The *uvula* depends from the middle of the lower border, and two curved folds of mucous membrane, which arch outwards on each side of the uvula, are named the *arches* or *pillars* of the soft *P.* The mucous membrane of this latter part is thin, and, like that of the hard *P.*, is covered with squamous epithelium. Around the orifice of the Eustachian tube the epithelium is of the *ciliated* and *columnar* description. The soft *P.* has five muscles on each side, and also close anatomical relations with the *Tonsils* (q. v.), which are situated between the anterior and posterior pillars of the soft *P.* The tonsils or *amygdalæ* are two glands of a

rounded form, their exact function being undetermined. They, however, secrete a glutinous fluid, which may possibly serve to lubricate the throat.

Deformities of the P.—There are various degrees of congenital deformity in the P. and uvula. The soft P. and uvula are most frequently cleft without the hard P. being divided; occasionally the lip and the hard P. are fissured without the soft one being cleft, and the separation may extend through all the parts to the integuments of the face, giving rise to the complication of hare-lip. The operation for the cure of a cleft in the soft P. is called *staphyloraphy*, and Roux was the first to introduce it as a distinct operation. Roux's operation was modified by Graefe, Warren, and others; but Fergusson introduced a new principle of treatment by dividing the levator palati and the palato-pharyngeus muscles, thus paralyzing the movements of the muscles of the P. Since that time, Mr. Smith, by the invention of the gag and the use of anaesthetics, has been enabled to operate in early infancy. Sir W. Fergusson introduced also a modification of the operation of staphyloraphy by osteoplasty. See MOUTH, DISEASES OF.

Palatinate (Ger. *Pfalz*), a name formerly applied to two German states distinguished as the Upper P. (Ober-Pfalz) and Lower P. (Unter-Pfalz), which were united until 1620. (1) The Upper or Bavarian P. was bounded by Baireuth, Bohemia, Neuburg, Bavaria, and the Nürnberg district, and was a duchy with Amberg as its capital. Its area was 2764 sq. miles. (2) The Lower or P. of the Rhine, belonging to the Rhine electoral circle, lay on both sides of that river, surrounded by Mainz, Würtemberg, Baden, Elsass and Trier, embracing the P. proper or electoral P., one of the most fertile districts of Germany, lying chiefly right of the Rhine, the principality of Simmern, the duchy of Zweibrücken, the half of Sponheim, and the principalities of Beldenz and Lauteln. Its area was 3190 sq. miles. Its chief town was Heidelberg. The Counts-Palatine were in possession of the P. and the surrounding country as early as the 11th c. They were among the most important princes of the Empire. In 1156 the Emperor Friedrich I. gave the P. to his half-brother, Konrad of Swabia, who made Heidelberg his seat. In 1215 Duke Otto III. of Bavaria received it on the outlawry of Duke Heinrich of Brunswick, and was succeeded by Ludwig II., 'the Strong,' in 1253, and by Rudolf I. in 1294, who, however, was banished by the Emperor Ludwig. Ruprecht III., who died in 1410, left four sons, of whom Ludwig III. received the Rhenish P.; Johann, the Upper P.; Stephen, Zweibrücken; and Otto, Mosbach. The provinces again united fell in 1559 to Friedrich of the Simmern line, but in 1619 Friedrich V. was deprived of his electorate and possessions by the Emperor. The lower P. was given, at the Peace of Westphalia, in 1648, to his son Karl Ludwig, with whose son Karl ended in 1685 the Simmern line. The P. now passed to Philipp Wilhelm, Count Palatine of Neuburg, who died in 1690, and was succeeded by Johann Wilhelm and his brother Karl Philipp, who died childless in 1742, when the electorate passed to Karl Theodor of Sulzbach, who united the P. to Bavaria. He was succeeded in 1799 by Maximilian Joseph, who was obliged at the Peace of Lunéville, in 1801, to cede to France the part of the P. left of the Rhine, and to Baden, Hessen-Darmstadt, Leiningen-Dachsburg, and Nassau, the part right of the Rhine. By the Treaties of Paris of 1814 and 1815, the P. was once more divided, the largest part being given to Bavaria, and the remainder to Hessen-Darmstadt and Prussia. See Häusser's *Geschichte der Rheinischen Pfalz* (2 vols., Heidelb. 1845).

Palatine, Counties, where the Earl (q. v.) exercised *jura regalia* or independent jurisdiction, corresponding to that of a *Comes Palatii*, were in England formerly three in number—Chester, Durham, and Lancaster, all of them frontier counties. Of these Lancaster alone, forfeited to the crown in the reign of Edward IV., retains its court, the palatine jurisdiction of Chester having been abolished in 1830, and of Durham in 1836. We also find mention of the C. P. of Pembroke and Hexham, dissolved in the reigns of Henry VIII. and Elizabeth respectively, but whether they enjoyed the same privileges as the preceding counties does not appear. In Scotland there were the Earls Palatine of Strathern.

Palatine Hill (*Mons Palatinus*), the highest of the seven hills upon which Rome is built, and the original site and

centre of the ancient city, is in the shape of an irregular quadrangle, 1900 yards in circumference and 168 feet above the sea-level. On the north-western slope, according to legend, grew the fig-tree beneath which Romulus and Remus were suckled by a she-wolf. In the times of the republic the P. H. was one of the most aristocratic quarters of the city, and it was chosen by the first Emperors as their place of residence. Augustus and Tiberius dwelt on the western slope, and the eastern side was afterwards covered by Nero's *Golden House*. The name *Palatinus*, derived from *Paler*, a pastoral deity, has passed into almost all modern languages as *palace*, in the signification of imperial residence.

Paley is an Indian name for *Cryptostegia grandiflora*, a twining shrub, belonging to natural order *Asclepiadaceae*, and a native of Hindustan. It abounds in a milky juice, which, when exposed for a short time to the sun, is converted into caoutchouc. The stem yields a very fine strong white fibre.

Pale, in Heraldry, one of the greater ordinaries, is a broad stripe placed perpendicularly upon and equidistant from the sides of the shield, of whose surface it occupies one-third.

Pale, English, that portion of Ireland which was held by the English since Strongbow's invasion in 1169, and which John divided into the twelve counties palatine of Dublin, Meath, Kildare, Louth, Carlow, Kilkenny, Wexford, Waterford, Cork, Kerry, Tipperary, and Limerick (1210). On the territory thus divided was imposed the observance of English law, and by the Statute of Kilkenny (1367) the use of the Brehon or native law was made an act of treason, as also was the intermarriage of the English with persons of Irish blood, or the adoption of English children by Irish foster-parents. The term pale is one of considerable vagueness, shifting with the growth or decrease of English supremacy. From the time of Edward III., however, it seldom extended beyond the province of Leinster. In Edward VI.'s reign, in the struggle for a common faith, the population within and without the pale became one, 'not as the Irish nation, but as Catholics.' The term was, however, still employed by Spenser and other writers in a non-political sense, and lives to-day in the phrase 'without the pale of civilisation.' See Goldwin Smith's *Irish History and Character* (1861).

Palea, or **Pale**, the name given to an inner bract or scale in *Compositae*, *Gramineae*, and some other plants, when of a thin yet stiff consistence, usually narrow, and of a pale colour. The term *paleaceous*, in botanical descriptions, means of a chaffy consistence.

Palembang, the capital of a Dutch residency of the same name in Sumatra, is situated in the S.E. of the island, on the N. bank of the estuary of the Musi, which is here 100 feet broad, and which enters the sea opposite the large island of Banca. The river, from 40 to 50 feet deep, forms an excellent harbour for the largest vessels, and there is an extensive export trade in rice, benzoin, gum-elastic, raw cotton, rattans, &c. (value 1870, £106,159). The inland river trade is also considerable. The native houses are constructed of bamboos, and raised on posts, but there are various large buildings, including a fort, a mosque, a blind asylum, &c. The inhabitants, mostly Malays, but also comprising many Europeans, Chinese, and Arabs, are skilful workers, and produce carved ivory, embroidered silk, coloured cotton fabrics, gold and silver wares, japanned goods, and cutlery. Pop. 40,000.—The *Residency* lies between those of Djambi on the N., Lampong on the S., and Benculen on the W., and on the E. is washed by the Sunda Sea and Strait of Banca. Area, 61,911 sq. miles; pop. (1874) 508,668. The western boundary is formed by the volcanic mountain range that traverses the island, but great part of the area is low-lying morass thickly clad with jungle, and drained by the Musi and its tributaries, chief of which is the Komerang. There are several lakes, the largest being Itam in the S. The higher districts inland are covered with vast forests of cocoa-nut and gum trees, and yield much rice, cotton, sugar, pepper, and tobacco. There are extensive coal-fields, in which occur oil-springs, and among the mineral products are gold-dust, iron-ore, sulphur, and arsenic. The rivers and lakes abound with fish, and the forests are the haunt of the tiger, leopard, panther, elephant, and rhinoceros. The climate is only unhealthy near the swamps, and the temperature in the dry season ranges from 80° to 92° F., and in the wet season from 76° to 80°. The Kubus, a primitive tribe in the N.W., are supposed to be descendants of the aborigines.

Palencia, a Spanish town, capital of the province of the same name, lies on the left bank of the Carrion, and is surrounded by ancient walls of immense thickness. The most interesting building is the Cathedral of San Antolia (1321-1504). The first Spanish university was founded here in 1209, but was removed thirty years later to Salamanca. The inhabitants are chiefly engaged in the cultivation of the vine, and in the manufacture of woollen stuffs and leather. Pop. 14,000.

Palenque, 'the Pompeii of the New World,' a ruined town of Mexico, near the modern village of St. Domingo de P., in the State of Chiapas, and on the river Chacamas. It was discovered in 1750, buried in dense tropical forest, and is of the *pueblo* or village type. There are four or five pyramidal stone terraces similar in form and relative situation to those at Uxmal. One is much larger than the others, and on it are the remarkable structures called the 'palace,' altogether 228 feet long in front, and 180 deep. Most of the buildings, which are solid structures of one storey, are adorned with figures carved in relief, or with stucco figures and hieroglyphics, bearing traces of brilliant colours. The statuary is more akin in freedom and natural grace to that of Greece than to that of Egypt or India. See the works of Stephens, Catherwood, and Morelet.

Palermo, the capital of Sicily, and the fifth largest city of Italy, is beautifully situated on the N. coast of the island, on the W. side of the spacious Bay of P., 135 miles W. of Messina by water, and 60 N.N.W. of Girgenti by rail. Appropriately called 'la Felice,' on account of its magnificent position and delightful climate, it lies in the fertile plain of Conca d'Oro ('golden shell') and is sheltered in the N. by the romantic Monte Pellegrino, a limestone mass 1958 feet high, and inland by an amphitheatre of mountains. The city is 4½ miles in circuit, is girt with walls and entered by sixteen gates. Two fine main streets—the Corso Vittoria Emanuele, stretching S.W. from the sea at Porta Felice to the fortified gates at Porta Nuova, and the Via Macqueda, intersecting it at right angles—divide the city into four nearly equal parts. The houses, most of them externally shabby, are flat-roofed, and have balconies. There are many beautiful squares and promenades adorned with almost tropical vegetation, and with marble statues and fountains. A lack of ancient architectural remains is compensated by the treasures of the famous Museo, and the many interesting mediæval monuments. P. is the ecclesiastical, judicial, and military headquarters of the island. Among the churches are the cathedral or church of S. Rosalia, erected (1169-85) on the site of an older structure disfigured by the addition of a dome (1781-1801), but containing royal tombs and valuable sculptures; S. Domenico (1646), the largest church in the city, with accommodation for 12,000 persons; S. Giovanni degli Eremiti, one of the oldest existing Norman churches, and almost Oriental in style, with a bell which was the first to sound alarm at the Sicilian Vespers; and the disused Martorana, dating from the 12th c., rich in mosaics and Arabic inscriptions. On a slight eminence to the S.W. is the Palazzo Reale, a vast building erected originally by the Arabs as a castle, but transformed by the Normans. Its Cappella Palatina, a gem of mediæval architecture, is richly encrusted with curious old mosaics and adorned with columns of Egyptian marble. Other notable buildings are the archiepiscopal palace, dating in its present form from the 16th c., with its fine façade; the Palazzo del Municipio, containing Roman antiquities; and the palaces of Chiaramonte, Sclafani, and Patella, all admirable specimens of later mediæval architecture. The Museo Nazionale is famous for its splendid collection of ancient sculptures and its gallery of Sicilian pictures. The university, founded in 1394, and restored in 1804, had 340 students in 1875. P. has various literary and scientific institutions, three theatres, and a Flora or public garden, perhaps the most beautiful in Italy, adjoining which are the botanical gardens. The Porto, to the N.E. of the town, is sheltered by a mole 1300 feet long. In front of the town is the recently deepened harbour of La Cala, with the Porto Felice on the right, and on the left the extensive fort of Castellamare, almost entirely destroyed in 1860. In 1874 there entered the port 6171 vessels of 814,226 tons (382 British of 250,901 tons), and the exports were chiefly oranges and lemons, wines, oil, sulphur from the mines of Larca (14,000 tons), and shumac (100,000 bags). The manufactures are silks, cottons, jewellery, iron wares, coral ornaments, &c., while there is con-

siderable shipbuilding, stone-dressing, and tunny and sardine fishing. The environs of P. abound in objects of interest, among which are the great cathedral of Monreale (q. v.), the old Arabic châteaux of La Cuba and La Zisa, and the cave of S. Rosalia, the patron saint of the city, in Monte Pellegrino. The festival of S. Rosalia (11th to 15th July), accompanied by horse-races, processions to the chapel of the saint, and illuminations, &c., attracts a vast concourse of country people. That it may be celebrated with becoming splendour the municipality usually contributes some 5000 francs to the expenses. The climate is usually mild and humid, the temperature averaging 52° F. in January; but in summer, especially when the sirocco prevails, the heat is intolerable. Pop. (1874) 186,145. P., the ancient *Panormus* (Gr. 'entirely harbour'), was probably of Phœnician origin (the Phœnician name, *Machanath*, found on coins, means 'a camp'), but is first known in history as one of the most important strongholds of the Carthaginian invaders. It was taken by the Romans in the first Punic War (254 B.C.), and became one of their chief naval stations. While the island formed part of the Eastern Roman Empire, it was taken by the Arabs in 831, and subsequently fell to the Normans in 1072. The French held it from 1266 to 1280 (see SICILIAN VESPER). In 1269 Charles of Anjou removed his court to Naples, and later P. was the residence of the Aragonese viceroy. The Bourbon Ferdinand IV. took up his quarters here on his expulsion from Naples in 1799. After various abortive revolts, the inhabitants, on the landing of Garibaldi at Marsala in 1860, finally threw off the Bourbon yoke, and by an enthusiastic *plébiscite* joined the city to the kingdom of Italy. The environs are still sadly infested by brigands. See Oppermann's *Palermo* (Bresl. 1860).

Pal'estine, or **Phil'istia**, originally the name of the territory of the Philistines (q. v., cf. Ex. xv. 14; Is. xiv. 29, 31; Joel. iii. 4), was latterly applied to the whole country so long inhabited by the Israelites or Jews, other names for which were the Land of Canaan (Num. xxxii. 30), Land of Promise (Heb. xi. 9; cf. Gen. xiii. 15), Land of Israel (1 Sam. xiii. 19; Matt. ii. 21), Judea, and the Holy Land. This last name, which was first used by Zechariah (ii. 12), has been a favourite one with Christians from its being the birthplace of our Saviour. The geographical position of P. is peculiar. The Jews regarded it as the centre of the earth, and it is exactly in the position from which there is the nearest access to Europe, Asia, and Africa; hence, from the time of Chedorlaomer (Gen. xiv. 1) to that of Napoleon Bonaparte, it has enjoyed the unenviable privilege of being one of the great battlefields of the world.

Physical Geography.—P. proper is the narrow strip of land lying between the Jordan and the Dead Sea on the E., and the Mediterranean on the W., to which there has always been attached a narrow strip with indefinite boundaries on the E. side of the Jordan; forming altogether a country about the size of Wales, less than 140 miles in length, and 40 in average breadth. The most characteristic of all the features of the country is the Jordan valley, by which it is cut off from the mainland of Asia, and which is in reality part of a ravine which runs from Lebanon to the head of the Gulf of Akaba. This ravine is filled up at both the extremities of the country, and the Jordan, rising at the northern end, is dammed back at the southern into the Dead Sea, so that it belongs with its three lakes entirely to P. Through the whole length of the country, from the mountains of Lebanon to the southern end of the Dead Sea, runs an irregular mass of hills of no great height, which is everywhere intersected by ravines, in some cases widened into valleys, formed by mountain torrents. This range, being nearer the Jordan, leaves room for a plain which runs along the coast the whole way, except where, opposite the Sea of Galilee, it is interrupted by the range of Carmel (q. v.), stretching out from the central highlands to the sea as if to make room for the plain of Esdraelon (q. v.), which here extends from the Mediterranean to the Jordan. The average height of the central region is 1500 to 1800 feet above the Mediterranean. A few of the highest points are Jebel Jermuk, about 4000 feet; Safed, 2775; Ebal and Gerizim, both about 2700; Singil, near Shiloh, 3108; Mount of Olives, 2724; Hebron, 3029. The portion of P. on the E. of the Jordan consists of a plateau about 2000 to 3000 feet in height, cut by many ravines formed by mountain torrents descending to the Jordan.

The general aspect of the country has changed very materially from what it was in the early days of the Jewish State. When invaded by the Israelites under Joshua it was a well-wooded, well-watered country, producing grain and fruit in abundance—'a land flowing with milk and honey.' There are traces even yet of the former fertility of the country, e.g., in the rich pastures of Sharon, Moab, and Gilead, the evergreen shrubberies of Carmel, the oak forests of Bashan, and the great profusion of flowers everywhere. The cutting down of the timber has doubtless changed the climate, and rendered the country less productive, and the insecurity of life and property under an unsettled government, which has prevailed so long, has discouraged the inhabitants from making the most of its capabilities. The rounded hills, which used to be clothed with vineyards to their summits, now show nothing but gray limestone rocks or gray shrubs, the soil being all washed off the neglected terraces. Even the plains are little cultivated, and are bleak and desolate looking. As a natural consequence of its unproductiveness the country is now very thinly populated. This also is in strong contrast with the dense population of former times, of which there are abundant traces in the ruins of towns and villages which everywhere abound.

The climate of P. is remarkable for the great variety of temperature that prevails within such narrow limits. Between the perpetual snows of Hermon and the tropical heat of the shores of the Dead Sea, there are to be found, among the hills of Bashan, of Galilee, Ephraim, and Judah, and on the coast plain, or even almost in passing from the source to the mouth of the Jordan, all the kinds of climate to be found in passing from the frigid to the torrid zone. Consequently the summer heat varies greatly in different localities. No rain falls from June to September. A small quantity falls in October, and the next four months form the rainy season. Seed-time for the different grains, and in different localities, extends from October to January, and harvest from March to June.

The variety of climate which has been mentioned produces a corresponding variety of animal and vegetable life. The animals, both wild and domesticated, and the plants, both wild and cultivated, include most of those to be found in Europe, besides the local Asiatic fauna and flora.

Geology.—The prevalent rock of P. is a limestone, the numerous caverns in which have always formed a striking characteristic of the country, being used by the inhabitants as tombs (cf. Gen. xxiii. 19; John xi. 38), granaries, and temporary dwellings (cf. Gen. xix. 30; Judg. vi. 2; 1 Sam. xiii. 6, xxii. 1, xxiv. 3). This limestone is in several places—e.g., in Bashan, on the W. side of the Jordan, and S.W. of the Sea of Galilee—overlaid by basalt, which has been erupted from numerous volcanoes, which, however, have been extinct for ages. That earthquakes were a familiar phenomenon is proved by many allusions to them in Hebrew literature (cf. Ps. xli. 2, cxiv. 4-6; Isa. xxiv. 20; Hab. iii. 6-8), as well as by those that are actually recorded (cf. Amos i. 1; Zech. xiv. 5; Jos. Ants. xv. 5, 2, &c.). The numerous hot, sulphurous, and salt springs which are found in the Jordan valley are an indication that the same agency is still in some degree active.

Political and Historical Geography.—When the Israelites arrived at P. from Egypt, the country was in the possession of a number of tribes, the boundaries of whose territories cannot be exactly defined. (See HITTITES, HIVITES, AMORITES.) The two Hebrew tribes of Reuben and Gad and the half tribe of Manasseh settled on the E. of the Jordan, in the territories of Sihon and Og. In P. proper, the region lying due W. of the Dead Sea was allotted to the tribe of Judah, with which were amalgamated the tribes of Dan and Simeon. N. of this lay the narrow strip of Benjamin. Between Benjamin and the plain of Esdraelon lay the portions of Ephraim and the other half tribe of Manasseh. The region between Carmel and the Sea of Galilee fell to the two tribes of Issachar and Zebulun; and that to the N., as far as the mountains of Lebanon, to Naphtali and Asher—the former next the Jordan, and the latter next the sea. On the death of Solomon (B.C. 976) the country was divided into two kingdoms, the boundary between which was the northern border of Benjamin—Judah in the S., with Jerusalem (q. v.) for its capital, and Israel in the N., with Shechem (q. v.), and afterwards Samaria (q. v.), for its capital. The northern kingdom was obliterated by the Assyrian conquest of Shalmaneser (B.C. 721), the southern, by Nebuchadnezzar

(B.C. 606); after which, notwithstanding the return of a number of Jews (q. v.) to Jerusalem (B.C. 536), the country continued to form a part of a Persian satrapy till the conquest of Alexander the Great (B.C. 332). During this period the Moabites (q. v.) and the tribe of Bashan took possession of their old territory E. of the Jordan; the Edomites (q. v.), pressed by the Nabatheans (q. v.) from the E., encroached on the south of P., which was thus included in the territory of Idumea (q. v.); while the neighbouring tribes did the same in the N., so that there always remained a large Gentile element in that part. On the death of Alexander, P. formed first a part of the empire of Egypt and then (from B.C. 198) of Syria. The independence of the country was again established by the Maccabees (B.C. 165), but in B.C. 63 it was conquered by the Romans, to whom it remained subject till the Mohammedan conquest (A.D. 637). As described in the New Testament, under the Herodian princes, the country W. of the Jordan was divided into the three provinces of Judea in the S., Galilee N. of Carmel, and Samaria in the middle. The trans-Jordanic part as far N. as the Sea of Galilee formed the province of Perea; and N. of that were the regions of Gaulonitis, Iturea, Auranitis, Trachonitis, and Batanea. After 637 P. formed a province of the Saracen Empire. From 1099 to 1291 it was nominally a Christian kingdom under the Crusaders; and since 1517 it has formed part of the Ottoman Empire. The modern population has been estimated at about 824,000, of whom about 80,000 are Christians, 12,000 Jews, and the rest Mohammedans. Jerusalem has about 20,000; and the only other towns of any importance are Gaza, Joppa, Acre, and Nabulus. A very great amount of light has been shed on many points of Jewish topography and history by the labours of the 'Palestine Exploration Fund' (organised 1865) and the 'American Palestine Exploration Society' (organised in 1870). The triangulation of Western P. was begun in 1871, and is now (1878) completed. See Kito's *Cyclo. of Bib. Lit.* (new ed. Edinb. 1876); Smith's *Dict. of the Bible* (Lond. 1863); Robinson's *Biblical Researcher*, &c. (2d. ed. 1856); Porter's *Handbook of Syria and P.* (Lond. 1858; new ed. 1875); Thomson's *Land and the Book* (Edinb. 1866); *Our Work in P.* (1873), by the 'English Exploration Fund'; Stanley's *Sinai and P.* (Lond. 1864); Kail Ritter's 'P.' from his *Erdkunde*, translated by W. L. Gage (4 vols. T. & T. Clark, Edinb.); Baedeker's *Palestina und Syrien* (Leips. 1875; Eng. trans. 1876); which contains the freshest and most accurate information regarding the present condition of the country.

Palestrina, a town of Italy, 22 miles E.S.E. of Rome, is built on the S.W. slope of an offset of the Apennines (2546 feet), which is crowned by the medieval Castel St. Pietro. It contains a cathedral, the remains of cyclopean walls, and the Palazzo Barberini, with statues, paintings, and mosaics. Pop. (1874) 6015. P. occupies the site of the ancient *Praneste*, the most ancient and important of all the Latin cities, which seceded from the Latin League and allied itself to Rome (499 B.C.), was destroyed by Sulla (82 B.C.), but under the emperors became a favourite summer resort, being the occasional residence of Augustus, Horace, and Hadrian. The ruins of its famous Temple of Fortune were demolished by Pope Boniface VIII. in the 13th c., but those of Hadrian's villa may still be seen. In the Middle Ages P. belonged to the Colonnas, whose conflicts with the popes led to its second destruction (1436), and who sold it to the Barberini (1630). Excavations here have yielded the 'Antoninus Braschi,' now in the Vatican, and numerous other treasures of antiquity.

Palestrina, Giovanni Pierluigi da, the greatest composer of the 16th c., was born at Palestrina (q. v.) in 1524. He was sent to Rome to study under Claude Goudimel in 1540, and in 1551 became chapel-master in the Julian Chapel. He resigned this appointment in 1555, and was afterwards attached to the churches of St. Giovanni di Laterano and Ste. Maria Maggiore. For the latter he composed in 1560 the *Improperia*, which has ever since been performed every year on Good Friday. About 1565 he produced three masses—the *Missa Papa Marcelli*—which created quite a revolution in sacred composition, and were regarded as prodigies of musical art. These and a second book of eight masses in 1570 he dedicated to Philip II. of Spain. The authorities of the Church, struck with the vulgarity and impiety of the compositions then in vogue, had determined on a return to the simple Gregorian chant, when the devout style and pure harmonies of P. recalled them to a sense of the majestic power

of noble music. P. was one of the founders of the celebrated musical school at Rome established about 1571. He died 2d February 1594, and was buried in the Church of the Vatican. He left thirteen books of masses, two volumes of motets (including the famous *Popule Meus*), two volumes of litanies, a Stabat Mater, a volume of sixty-eight offertories, and a great variety of other music. See the Abbé Baini's *Memorie storico-critiche della Vita e delle Opere di Giov. P.* (Rome, 1828; Leips. 1834).

Palestro, a village of Piedmont, Italy, 18 miles S.E. of VerCELLI, was the scene of a double victory won by the Franco-Sardinian troops over the Austrians, 30th and 31st May 1859.

Palette, a thin oval board of hard wood, or a similar shaped porcelain slab with a thumb-hole in it near one extremity, used by artists for mixing and preparing their colours in painting. A thin steel blade with a wooden handle, used for mixing paints with oil, is called a *P. knife*.

Paley, William, D.D., an English theologian and ethical writer, was born at Peterborough in July 1743. After having been carefully educated by his father, who was a Yorkshire schoolmaster, he entered Christ's College, Cambridge, as a sizar in 1759, and took his degree of B.A. with highest honours in 1763. After having spent three years as an assistant-teacher in Greenwich Academy, he was elected fellow of his college in 1766, took the degree of M.A., and removed his residence to the University, where he remained for the next ten years. P. now married, and having in consequence to give up his fellowship, was appointed vicar of Dalston in Cumberland, and Appleby in Westmoreland. In 1780 he became Canon of Carlisle, in 1782 Archdeacon, and in 1784 Chancellor. In 1793 he obtained the vicarage of Stanwix, near Carlisle, and vacated that of Dalston. The year following he was appointed prebendary of St. Pancras, London, and was soon after promoted to the sub-deanery of Lincoln. The degree of D.D. was conferred on him by the University of Cambridge in 1795, on his being presented by the Bishop of Durham to the rectory of Bishop Wearmouth. He died 25th May 1805. P. was a man of genial temperament and original character, who knew how to use life without abusing it, and who placed more stress, both in his works and by his own example, upon the useful practice of virtue than upon a profession of exalted religious enthusiasm. His writings, original in form rather than in matter, are distinguished by rare clearness of thought, vigour of style, and an unsurpassed felicity of illustration. He is one of the ablest expositors of that popular philosophy which relies upon the principle of final causes to establish the existence and attributes of God. As a Christian apologist, P. exercised the greatest influence upon the mind of his age, though many of his arguments, then considered irrefutable, have failed to meet the demands of modern scepticism. His chief works are *Elements of Moral and Political Philosophy* (1785); *Horæ Pauline, or the Truth of the Scriptural History of St. Paul, evinced by a Comparison of the Epistles which bear his Name with the Acts of the Apostles, and with one another* (1790); *A View of the Evidences of Christianity* (1794); *Natural Theology, or Evidences of the Existence and Attributes of the Deity* (1802); a work largely founded on the Dutch mathematician Nieuwentijt's *Het regt Gebruik der Welbeshouwingen*, which appeared in English under the title of *The Religious Philosopher* (1718). A collected edition of P.'s works was published in 1838 by his son, in 4 vols. 8vo. See Meadley's *Life of W. P.* (1809). His grandson, **Frederick Apthorp P.**, became a convert to Roman Catholicism in 1846, and has since 1874 occupied the chair of classical literature in the Catholic University College at Kensington. He has gained for himself a high reputation as a translator and editor of the classics, and has also written with success upon architecture and botany.

Palghat, a town in the district of Malabar, Madras Presidency, British India, 332 miles S.W. of Madras by rail, and 74 miles from the W. terminus of the railway at Beypore. Pop. (1871) 30,752. It occupies an important position, commanding the only pass across the steep range of the W. Ghats, and contains a strong fort built by Hyder Ali; but is now best known for the export of timber, chiefly teak, and its transit trade.

Palgrave, Sir Francis, the son of a Jewish stockbroker, Mr. Meyer Cohen, was born in London, July 1788. He was a solicitor's clerk (1803-22), embraced Christianity and assumed the name of P. (1823), was called to the bar (1827), and

knighted (1832), in recognition of the services rendered to anti-quarian and constitutional knowledge by his *Parliamentary Writs* (2 vols. 1827-34), *History of England* (1831), and *Rise and Progress of the English Commonwealth* (1832). He served on the Municipal Corporation Commission (1833-35), and was Deputy Keeper of the Public Records from 1838 till his death at Hampstead, July 6, 1861. Among P.'s other works were *Rotuli Curia Regis* (2 vols. 1835), *Calendars and Inventories of the Exchequer* (3 vols. 1836), *The Merchant and the Friar* (1837), *The History of Normandy and of England* (4 vols. 1851-64), and numerous articles in the *Edinburgh and Quarterly*, a list of which is given in the *Gentleman's Magazine* (October 1861).—**Francis Turner P.**, a son of the preceding, was born in London, September 28, 1824, and educated at the Charterhouse. He became a scholar of Balliol College, Oxford, and a fellow of Exeter, was for five years vice-principal of the Schoolmasters' Training College at Kneller Hall, and has since been private secretary to Earl Granville, and has filled a post in the Educational Department of the Privy Council. He is author of *Essays on Art* (1866), a capital fairy story—*Five Days' Entertainments at Wentworth Grange* (1868), and *Lyrical Poems* (1871), but is best known by his exquisite collections, *The Golden Treasury* (1861), and *The Children's Treasury of Lyrical Poetry* (2 vols. 1875), and by his editions of *The Sonnets and Songs of Shakespeare* and *Selected Lyrical Poems of Herrick* (1877).—Another son, **William Gifford P.**, born in Westminster, January 24, 1826, passed from the Charterhouse to Trinity College, Oxford, where he graduated with first-class honours (1846). He served in the Bombay Native Infantry from 1847 to 1853, when, having become a Catholic, he resigned his commission, entered the Order of Jesus, and after studying theology at Laval in France was ordained priest, and sent as a missionary to Damascus. Here he acquired that thorough mastery of Arabic and Mohammedan theology which enabled him to undertake, at the expense of Napoleon III., a daring expedition through the Wahabite kingdom of Central Arabia. This he successfully achieved (1862-63), disguised as a physician, and returning to Europe, quitted the Order of Jesus (1864), and was sent out to Egypt by the English Government (1865), to treat for the release of the Abyssinian captives. He was appointed British consul at Soukhoum-Kalé (1866), at Trebizond (1867), and at St. Thomas in the West Indies (1873). Besides his great work, *Personal Narrative of a Year's Journey through Central and Eastern Arabia* (2 vols. 1865), P. has published *Essays on Eastern Questions* (1872), *Hermann Agha: an Eastern Narrative* (2 vols. 1872), *Alkamah's Cave: a Story of Nejd* (1875), and *Dutch Guiana* (1876).

Pa'li, the classical language of Buddhist literature, in which are written the sacred, metaphysical, and historical works. The earliest P. alphabet is that found in the inscriptions of Asoka (3d c. B.C.), first deciphered by James Prinsep; but European scholars have agreed to write the language in Roman characters. It is manifestly derived from a vernacular corruption of the ancient Sanskrit, carried to Ceylon, Burmah, and Siam, when the Buddhists were expelled from India; but it nowhere now survives as a spoken tongue. It is still studied by the native Cingalese scholars, and the knowledge of it was introduced into Europe by Lassen and Burnouf. But the great store-house of information is the *P. Dictionary* (2 vols) of the late Mr. R. C. Childers, published in 1875. This learned gentleman, who had been in the Ceylon Civil Service, was sub-librarian at the Indian office, and Professor of P. and Buddhist Literature in University College, London. His *P. Grammar* was not completed before his premature death in July 1876. Other eminent students of P. are Keru, Koeppen, Gogerly, Fausböll, Rhys Davids, and Sir Coomara Swamy.

Palikao, Cousin Montauban, Comte de, was born in Paris, 24th June 1796, and acquired the rank of a general of division in Algeria, where he served with distinction for twenty years. He commanded along with Sir Hope Grant and Sir Robert Napier in the Anglo-French invasion of China in 1860, and subsequently received his title from the great victory of Pa-li-kao (21st September). His 'looting' of the imperial summer palace was the subject of unfavourable criticism at the time. During the Franco-Prussian war he succeeded Ollivier as Prime Minister, 10th August 1870, but had to make way for the Republic on the 4th September following. The charges brought

against him by the radical press he successfully repelled in *Un Ministère de Guerre de Vingt-quatre Jours* (1871.)

Palimpsest (Gr. from *palimpsēstos*, 'scraped again'), is a parchment from which one writing has been erased to make room for another. The most ancient MSS. now existing are written on vellum, the prepared skins of very young calves, parchment, the prepared integuments of sheep, goats, and paper made from the reed papyrus, which was in common use long before the time of Herodotus (440 B.C.). Cotton and linen paper were manufactured as early as the 10th and 12th centuries A.D. respectively. But as none of these seem ever to have been plentiful, and vellum especially was always scarce and dear, the practice arose of erasing ancient writings from vellum and parchment to make room for others. This became especially common when the supply of papyrus from Egypt was cut off by the Mohammedan conquest in the 7th c. The process of erasure, however, was seldom so complete that the old writing did not appear more or less distinctly under the new. Now as MSS., as a rule, are of greater value the older they are, it is the partially-erased writing on a P. that is of most importance and value, and it is this which is always understood to be referred to in speaking of one. Some of the most valuable MSS. of the Scriptures are of this kind. Scholars, both Biblical and classical, have accordingly bestowed great pains in deciphering P. MSS., and by chemical and other treatment of them have generally succeeded in restoring the erased writing so far as to be legible.

The first P. published was a fragment of the 91st book of Livy's *History*, which was discovered in the Vatican by a German scholar, Dr. Paul Bruns, and published at Hamburg 1773. Fragments of the Gospel of St. Matthew were next published (1801) by Dr. Barret from a P. in the Library of Trinity College, Dublin, which is assigned to the 6th c. Perhaps the greatest name in the discovery and deciphering of palimpsests is that of Angelo Mai (q. v.). Among his important 'finds' in Greek were fragments of most of the Greek writers on Roman history, which are contained in the fifth volume of his *Scriptorum Veterum, nova Collectio* (Rome, 1831-38); in Latin, parts of the writings of Cicero, the comedies of Plautus, the works of Cornelius Fronto, &c. Niebuhr discovered part of the Institutions of Gaius, and Dr. Cureton nearly 4000 lines of the *Iliad* hidden under Syriac MSS. The most important P. in existence, as it is one of the most valuable MSS. of the New Testament, is the *Codex Ephræmi* in the National Library, Paris. The original writing, which consists of fragments of the LXX. and of every part of the New Testament, is assigned to the first half of the 5th c. In the 12th c. this was effaced and written over with the Greek works of Ephræm Syrus (q. v.). The MS. was brought from the E. to Florence in the beginning of the 16th c., and from thence to Paris by Catherine de' Médici. The New Testament part was published by Tischendorf in 1843, and the Old Testament in 1845. Another very valuable P. was brought to England in 1847 from a convent in the Nitrian desert, deposited in the British Museum, and deciphered by Tregelles (1854) and Tischendorf (1855). The original writing (of the 6th c.) contains the Gospel of Luke, but this was covered in the 9th c. or 10th c. by Syrian writing. A P. in possession of the Bible Society of London also contains important fragments of Luke, probably written in the 8th c., but written over with a Greek Lectionary of the 13th c. A multitude of less important P. MSS., both in Greek and Latin, are to be found in the libraries throughout Europe, as well as in this country. See Scrivener's *Introduct. to the Crit. of the New Test.* (Camb. and Lond. 1861); Tischendorf's *Cod. Ephræmi, Prolegomena* (1843); *Monumenta Sacra inedita* (1860); and Dr. F. Mone's *De Libris Palimpsestis tam Latinis quam Græcis* (Karlsruhe, 1855).

Palindrome (Gr. *palin*, 'backwards,' and *dramain*, 'to run'; Low Lat. *versus cancrinus*, 'crab's verse'), a species of verse the origin of which is ascribed to Sotades, a Greek poet of the 3d c. B.C., in which the letters read the same backwards as forwards, e.g., the line quoted by Sidonius Apollinaris, *Ronia tibi subito motibus ibit amor*; or Taylor the Water Poet's 'Lewd did I live, & evil I did dwell.' In the chanson of Baudouin de Condé, a French poet of the 13th c., only the words can be read backwards:—

'Amours est vie glorieuse
Tenir fait ordre gracieux
Maintenir vult courtoises mours.'

Palingenesis (Gr. *palin*, 'again,' and *genesis*, 'birth'), in the New Testament denotes (1) regeneration, or the new birth—that is, the change from a carnal nature to the Christian life (Tit. iii. 5); (2) renovation, restoration—that is, in the Messiah's kingdom, or perhaps simply the resurrection (Matt. xix. 28). In the early Church it was sometimes used as a name for Baptism, in reference to Tit. iii. 5. In the Stoic philosophy (cf. M. A. Antoninus) P. meant the periodical renovation of all things by which they are first dissolved into the principal elements of which they are composed, and then rebuilt or revived into new forms.

Palinode (Gr. *palinodia*) originally denoted the recantation of an ode or poem by another. The use of the term was strictly literary; but it has been adopted into Scotch law. In an action for damage on account of defamation before the Commissary Court (q. v.), it was the practice in Scotland to demand not only damage and expenses, but a judicial recantation or P., and the practice is held to be still competent by the law of Scotland.

Palinurus, a genus of *Decapodous* crustacea, including the *P. vulgaris* or Spiny Lobster, frequently exposed for sale in the markets under the name of 'sea cray-fish.' It has a spiny carapace or shell, with three prominent spines in front. The members of the family *Palinuridae*, of which P. is the type, are distinguished by their long and cylindrical body. The outer antennæ are very long and thick, and its basal joint is large. The walking feet are terminated by a single claw, and the sternal plate is wider than in the common lobster. The claws are not large. The spiny lobster occurs most frequently on the S. and W. coasts of Britain. Its flesh is palatable, but is reckoned somewhat coarser than that of the lobster. An average specimen will weigh 4 or 5 lbs. and attain a length of from 16 to 18 inches. Its colour is a purple brown beautifully variegated with lighter spots and markings. *P. ornatus* is a species which may attain the enormous length of from 3 to 4 feet.

Palisander Wood is a name used in France for Rosewood (q. v.), and is sometimes also applied to striped ebony and violet-wood or Kingwood (q. v.).

Palissy, Bernard, a famous French ceramic artist, was born at Saintonge, near Agen, about 1510. Of humble parentage, he was early apprenticed to a potter, but acquiring a knowledge of geometry, became a land-surveyor, and travelled much in France and Germany. The chance sight of an enamelled cup turned his attention seriously to pottery, and for sixteen years he inflexibly pursued the art amid the utmost discouragements of poverty and ridicule. At last fame dawned on him, bringing wealth and court favour, and he is now recognised as one of the greatest artists of the French Renaissance. As a Huguenot he was imprisoned in 1562, but liberated on the intercession of Montmorency, and subsequently, by express order of Catharine de' Médici, exempted from the massacres of St. Bartholomew. He did much to bring about a truly scientific study of physics and natural history, and anticipated many recent discoveries. In 1588 he was again arrested as a heretic and thrown into the Bastille, where he lingered till his death in 1590. P. is equally notable for his artistic genius and for his incorruptible nobility of character. Several of the Paris museums contain collections of his pottery (mostly small vases, ewers, jugs, &c.), valued now almost beyond price, and distinguished by fineness of material, richness of ornament, and elegance of outline. The chief of his glass-paintings is a *Psyche*, after Raphael. His writings on the formation of springs, the fertilising power of marl, the means of purifying water, &c., were published by Faujas de St. Fond and Gobet in 1777, and by A. Cap in 1844. See Lives, by A. Dumesnil (Par. 1851), H. Morley (2 vols. Lond. 1852), and J. Salles (Nîmes, 1855).

Paliurus, a genus of *Rhamnaceæ*, with a dry hemispherical fruit, having an orbicular membranous wing an inch in diameter, making it resemble 'a head with a broad-brimmed hat on.' The stipules are converted into prickles. In *P. aculeatus*, commonly called Christ's thorn, the lithe branches are beset with one hooked and one straight prickle at the base of each leaf. It is a bush or small tree, native of countries bordering the Mediterranean, and of W. Asia, and being common in Palestine, has been selected as the likeliest plant to have formed the crown of thorns referred to in St. Matt. xxvii. 29, although the allied *Ziziphus spina-Christi* is supposed by some to have a higher claim. From its thorny character and entangling growth, it makes

a useful hedge plant, and its seeds are employed in Turkish medicine; they also furnish a dye. *P. Aubletii*, a thorny tree, native of China and Japan, has also been recommended for hedge-making.

Palk Strait, the channel which separates the island of Ceylon from the mainland of the Indian peninsula on the N., about 100 miles in length, and 40 miles wide at the narrowest. The water is shallow throughout, and at the narrowest point a chain of sandbanks called Adam's Bridge (q. v.) runs across. The project has been revived of cutting a navigable channel for large ships through this strait, and the plan supported by Mr. Robertson, a government engineer, would cut across the island of Rameswaram for 1 mile and 1 furlong, traversing a sandy plain only 7 feet above high water mark, but requiring much dredging at either end. The depth would have to be 28 feet, and the total cost is put at £440,000. Another project, for crossing the promontory of Ramnad, would utilise the newly opened railway to the port of Tuticorin.

Pall (Lat. *pallium*), (1) originally a Greek cloak specially worn by philosophers or ascetics, was adopted as an article of dress by those of the early Christians who specially affected asceticism. Afterwards, when the clergy were chiefly chosen from among the monks, it became (in the 5th or 6th c.) the usual habit of the clergy. At a later period the P. was a white linen garment received by all bishops in the East at their consecration, which the Popes of Rome began to bestow on their special representatives among the bishops. Boniface III. decreed (1215) that it should be conferred by the Pope on every metropolitan or archbishop, who can perform none of his archiepiscopal functions without it, and has to pay a certain sum for it. The P. now consists of a band of white woollen cloth passing round the neck, from which two pieces of the same hang down, the one on the breast, the other on the back; the whole ornamented with crosses. The cloth is made by the nuns of St. Agnes from the wool of two lambs, which are solemnly blessed in the church, and on the festival of that saint. See Pertsch, *De Origine, &c., Pallii archiepiscopalis* (Helmst. 1754). (2) The name of P. given to the black or white cloth thrown over a coffin when being carried to the grave may have derived its name from the clerical garment. At any rate, the bier used to be carried to the grave by the clergy on their shoulders (Brand's *Pop. Ants.*). Or the name may have been applied to the cloth in the sense of a coverlet. (3) P. was the name given in the ancient Church to the white cloth with which the communion-table or altar was covered. It is now applied to the covering of cloth variously ornamented for the chalice used in the mass.

Pall, in Heraldry, the upper part of a saltire joined to the lower part of a Pale (q. v.), having thus the form of a Y. Imitating, as it does, the form of the ecclesiastical P., it is a common charge on the arms of bishops.

Palladio, Andrea, a famous Italian architect and writer on art, was born of poor parents at Vicenza, 30th November 1518. He was early taken to Rome by Trissino, and cultivated his extraordinary natural talent by studying the classic buildings of antiquity there and in other Italian cities, together with the writings of Vitruvius. On his return to his native town he was entrusted with the restoration of the Basilica, a work which at once spread his reputation throughout Italy. From this time till his death he was continuously engaged, chiefly at Vicenza and Venice, in designing and executing buildings which, for careful arrangement, elegant proportion, and richness of execution, are regarded as masterpieces of the Renaissance style, and which have exercised a great influence on subsequent Italian architecture. The principal of these, besides the Basilica, are the Palazzo Chiericardo in Vicenza, and the Church of San Giorgio Maggiore at Venice. P. wrote a treatise on architecture which has been translated into most European languages, *Quattro Libri dell' Architettura* (best edition, Vicenza, 4 vols. 1776-83). He died at Vicenza 19th Aug. 1580. See Temanz's *Vita di A. P.* (Venice, 1763), and Magrini's *La Vita e le Opere di A. P.* (Padua, 1846).

Palladium, a wooden image of Pallas Athene, five feet high, fabled to have been cast down from heaven by Zeus as a pledge of the safety of Troy, where it remained enshrined till, stolen away by Odysseus and Diomedes, it was transferred to Argos or Athens. Another legend ran that the P. was borne away by Æneas in his flight to Italy, and thenceforth preserved

in the Temple of Vesta at Rome, though here again its possession was contested by Siris, Lavinium, and other Italian cities. In modern European languages the word P. is applied to such guarantees of the well-being of a State as trial by jury, liberty of the press, &c.

Palladium (Pd = 106.5) occurs associated with platinum in its ores, and in small quantity with native gold and platinum. It resembles platinum, but is harder, much lighter, and oxidises more easily. At ordinary temperatures it remains unchanged, but when heated it becomes coated with a blue film of oxide, which decomposes, however, and therefore disappears at a higher temperature. It is separated from the platinum with which it is associated by mixing a prepared solution of the ore with cyanide of mercury, when a yellow precipitate of cyanide of P. is obtained, which yields the spongy form of the metal when heated. Unlike platinum, it forms a nitrate by direct union with nitric acid. It forms two oxides—the protoxide and binoxide. The former is basic, and has been obtained by gently heating the binoxide. It forms also corresponding chlorides, of which the tetrachloride is very unstable. The rarity of the metal prevents its being much used in philosophical instruments, for which it is peculiarly suitable because of its hardness, lightness, and difficulty of oxidation. An ingot of pure P., valued at £1900, and extracted from native P. and gold of the value of £1,000,000, was shown at the Vienna Exhibition of 1873.

Palladius, Rutilius Taurus Æmilianus, a Latin author of the 4th c. A.D., who wrote a treatise, *De Re Rustica*, in fourteen books. Of these the first is introductory, twelve are devoted to the twelve months of the year, and the last is a poem on the art of grafting. It is an ingenious compilation from Columella, Gargilius Martialis, the *Geoponica*, and Vitruvius; was published by Jenson (Ven. 1472) and Schneider (Leips. 1794), and has been translated into English by Thomas Owen (Lond. 1803), as also into French, German, and Italian.—**P.**, a Greek ecclesiastical writer, born in Galatia about 367 A.D., at the age of twenty became a hermit in the Thebais, and was chosen bishop of Helenopolis in Bithynia (400). Accused of Origenism, he fled to Rome (405), returned to his see (417), and shortly after was translated to that of Aspona in Galatia, where he died about 430. He wrote the *Historia Lausiaca* (so called because dedicated to the Prefect Lausus), a series of lives of ascetics, of which the original Greek text was published by Duceus (Par. 1624), and the Latin version in the *Vita Patrum* (Ant. 1615).

Pallas. See MINERVA.

Pallas, Peter Simon, a German naturalist, was born at Berlin September 22, 1741. After a scientific education at Berlin, Göttingen, and Leyden, he was employed in classifying certain collections in Holland and England. P. first won a reputation by his *Elenchus Zoophytorum* and *Miscellanea Zoologica* (Hague, 1766), and two years afterwards was invited to St. Petersburg, whence he accompanied as naturalist a scientific expedition sent to Siberia in 1765 to observe the transit of Venus. During a six years' absence, P. explored the Mountains, the district on the river Jaik, and the Kii Steppe, the Altai range, and all the country as far as Kiach. The results of his researches were published in his *Reise in Mehrere Provinzen des Russischen Reichs* (3 vols. St. Petersburg. 1771-76). P. now turned his attention to botany, and employed himself for several years with the greatest ardour in exploring the different parts of the empire. In 1796 he was presented by the Empress with an estate in the Crimea, on which he lived till shortly before his death, which took place during a visit to Berlin, September 8, 1811. The other chief works of P. were *Spicilegium Zoologicum* (14 parts, 1767-80); *Flora Rossica* (2 vols. 1784-85); *Sammlung Historischer Nachrichten über die Mongolischen Völkerschaften* (2 vols. 1776-1802); *Bemerkungen auf einer Reise durch die Südliche Statthaltschaften des Russischen Reichs* (2 vols. 1799; Eng. trans. 1812); and *Linguarum totius Orbis Vocabularia Comparativa* (1787-89).

Pallavicini, Pietro Sforza, an Italian historian, eldest son of the Marquis Alexandro P. of Parma, was born at Rome 20th Nov. 1607. In opposition to the wishes of his parents he entered the Church, and filled some important offices under Pope Urban VIII. In 1637 he joined the Society of the Jesuits, and in 1657 he was created cardinal by Pope Alexander II., to whose elevation he had contributed. He died at Rome 5th June 1667. P.'s

two most important writings are his *Istoria del Concilio de Trento* (2 vols. fol. Rome, 1656-57), and his *Vindicationes Soc. Jesu* (4to, Rome, 1649). P. was a fine scholar, and an able historian, but opposed to the liberal tendencies in the Church.

Palliobranchia'ta, a name formerly applied to the class *Brachiopoda* (q. v.), belonging to the lower *Mollusca* (q. v.), under the idea that the *mantle* or *pallium* which forms the shell constituted the breathing organs of the class. This notion is only true in a modified degree, if indeed at all. The *cirri* or *arms* so characteristic of the brachiopods are the chief organs of respiration.

Palliser, Lieut.-Colonel Sir. Wm., fifth son of Colonel Wray Palliser of Comragh, Waterford, Ireland, was born at Dublin, June 18, 1830. After leaving the Staff College, Sandhurst, he obtained a commission as ensign in the Rifle Brigade in 1855, and was transferred to the 18th Hussars in 1858. He retired from the army in 1871. He was knighted June 21, 1873, and received the Cross of the Commander of the Crown of Italy in March 1875. He is the author of many improvements in fortifications, the arming of ironclads, &c., but is best known as the inventor of the projectiles and guns which bear his name. The Palliser projectiles now used in the British navy and fortifications were a vast improvement in economy and efficiency on anything previously designed for piercing armour-plated ships. An immense quantity of old smooth-bore cast-iron guns were converted by a simple process invented by Sir. W. P. into rifled compound guns, and are known as 'P. guns.'—**John P.**, eldest brother of the preceding, born in 1817, has earned a name as an active and enterprising explorer. He published the *Solitary Hunter, or Sporting Adventures in the Prairies*, an account of travels in North America in 1853. He had command of a British expedition to the Indian country in 1856-57, and was a boundary commissioner in fixing the line of division between British North America and the United States from Lake Superior to the Pacific in 1857-60. His report on the topography and resources of the region was published in 1861.

Pallium. See **PALL**.

Palm, an ancient measure of length taken from the length or breadth of the hand. There were thus two distinct palms, one of which was regarded as three times the other. The Romans called these respectively *palmus major*, or simply *palma*, and *palmus minor*. The former was 8.74 English inches, the latter 2.91. The English P. is reckoned as equivalent to 3 inches, but it is rarely if ever used.

Palm, Johann Philipp, was born at Schorndorf in 1766. After serving an apprenticeship as a bookseller in Erlangen, and subsequently prosecuting his trade in Frankfurt and Göttingen, he married the daughter of the bookseller Stein in Nürnberg, and succeeded to the business. In the spring of 1806, there issued from his house the pamphlet *Deutschland in seiner tiefsten Erniedrigung*, which, though superficial on the whole, contained some bitter reflections on Napoleon and the conduct of the French troops in Bavaria, but of the contents of which P. to the last hour of his life declared himself quite ignorant. Its author is believed to have been Johann Konrad von Yelin, who died in 1826 at Edinburgh, and who was then a professor in a gymnasium at Ansbach. P. was arrested at Munich, and again on his return to Nürnberg, and examined before Marshal Bernadotte. Transferred to Braunau, it is said, by express orders from Napoleon, he was tried by an extraordinary court-martial and condemned to death. The sentence was executed on the same day, 26th August 1806. Subscriptions for his family were raised in London, St. Petersburg, Berlin, Hamburg, Dresden, and Leipzig. In 1866 a monument was erected to P. on the place where he suffered, and his tragic fate has been dramatised by L. Eckardt and A. Rungler. See *Biographie Johann Philipp Palm's* (Munich, 1842).

Palm'a, one of the Canary Islands (q. v.), is 67 miles W.N.W. of Tenerife. It measures 26 by 16 miles, and has an area of 718 sq. miles, with a pop. of 33,000. It is traversed by a lofty mountain range, which culminates in the Pico de los Muchachos (7900 feet). P. is volcanic, and contains a huge crater 9 miles in diameter, from which flows the only permanent stream on the island. The sugar cane is extensively grown and the exports also include honey, wax, and silk manufactures. The chief town is Santa Cruz, with a pop. of 4400.

Palm'a, the capital of Majorca, and of the Spanish province of Baleares, on the S.W. coast of the island, and on a fine bay between Capes Blanco and Figuer. A railway connecting P. with Inca was extended to Sineu in 1877. The town, which is walled, is the seat of a bishop, and has a Gothic cathedral with a beautiful spire called the Angel's Tower, a handsome exchange, a governor's palace, a medical school, and three *colegios*. The harbour is formed by a mole, which was being prolonged in 1877. One of the great marts of Europe in the 13th c., P. has now little foreign trade. From Algeria it imports cattle and contraband tobacco; from Great Britain, coal and railway materials; from Sweden and Norway, deals, planks, and timber. In 1876 there entered and cleared 48 vessels of 16,412 tons, and the imports amounted to £31,618, of which £22,795 were British. There is considerable shipbuilding, besides some manufactures of silk, soap, glass, and brandy. Pop. 40,418.—**E.**, a port on the S. coast of Sicily, 16 miles S.E. of Girgenti, exports fine almonds and other fruits, and has a pop. (1874) of 13,458.

Palm'a Christ'i is a name given to *Ricinus communis*, the Castor Oil Plant (q. v.).

Palm's, Cape, a low headland on the coast of Northern Guinea, in 4° 21' N. lat., 7° 44' W. long. The anchorage on its E. side is the best on the Guinea coast.

Palm'blad, Vilhelm Fredrik, a Swedish writer, born 16th December 1788, at Liljestad in Oestergötland, entered Upsala University in 1806, where he became a friend of Atterbom, and in 1807 a member of the 'Auroraförbund.' To further the literary objects of this society he bought in 1810 the University printing press, and under his guidance there issued from it the important periodicals, *Phosphoros*, *Poetisk Kalendar*, and *Svensk Litteratur-Tidning*. The novels and critical essays contributed to them by P. contain some of the best prose in the writings of the 'Phosphorists.' Taking his doctor's degree in 1815, he became 'Docent' (1822) and afterwards 'Adjunct' (1827) in history at the University, and published a *Handbok i äldre och nyare Geographien* (1826-27). In 1835 P. was appointed Professor of Greek. The fruit of his classical studies was translations of *Æschylus* and *Sophocles*, and his valuable *Grekisk Formkunska* (1843-45). His humorous story *Familjen Falkensvärd* (1844-45) and the historical novel *Aurora Königsmark och hennes Släkt* (1846-49) take a high place in the national literature. P. was a constant writer in various political journals, of which he himself edited one, *Läsning för bildning och nöje* (1847-48). He was also editor of the *Biographisk Lexicon öfver namnkyndig Svenska Män*. His last years (1847-51) were spent as editor of the Conservative paper *Tiden*, noted for fullness and accuracy of statistics. P. died 2d September 1852.

Palmella'cese, or **Palmell'ese**, is a family of green-spored unicellular *Alga*, characterised by the plants being composed of free or merely conglomerated cells propagated by the division of their contents (endochrome). Fertilisation has not been observed. The endochrome is not always green, indeed blue, yellow, and red are assumed by some of the species. They propagate with great rapidity, and the young plants exhibit remarkable powers of motion for a brief period, afterwards settling down and devoting all their energy to reproduction. Berkeley says that many organisms assigned to this order are doubtless mere transitional states of higher plants. The Red-Snow Plant (q. v.), *Protococcus nivalis*, is one of the most generally known examples, though *P. cruentus*, which appears like blood-stains at the base of walls, is one of the commonest. See **GORY DÆW**.

Palm'er was a general name loosely applied, e.g., in Chaucer, to Pilgrims (q. v.).

'Thanne longen folk to gon on pilgrimages,
And palmers for to seeken straunge strondes,
To ferne halwes kouthe in sondry londes;
And specially from everie schires ende
Of Engelond, to Caunterbury thei wende.'

Properly the name only belonged to one who had made a pilgrimage to the Holy Land, on his return journey, or as he journeyed hither and thither to the shrines of divers saints in fulfilment of his vow or discharge of his penance. The ordinary attire of a P. was a cloak of coarse black cloth, which enveloped the whole body, called a Slavonian, coarse sandals, a broad hat with cockle shells sewed on its brim, with a long staff in his hand, to the upper end of which was fastened a branch of palm.

Palmer, Edward Henry, an Oriental scholar, born at Cambridge, August 7, 1840, entered St. John's College, and graduated B.A. (1867). He served on the Survey Expedition to Sinai (1868-69) and to Moab (1869-70), was appointed Lord Almoner's Professor of Arabic in the University of Cambridge (1871), and was called to the bar (1874). Among his numerous works are *The Negeb, or S. Country of Scripture* (1871), *The Desert of the Exodus* (1871), a *Persian Dictionary* (1875), and verse translations of *The Poetical Works of Beha-Eddin Zohair of Egypt* (1877), *The Song of the Reed* (1877), &c.

Palmer-Flies form well-known flies used as bait by anglers, and especially in summer in trout-fishing.

Palmerston, Viscount, Henry John Temple, was the direct descendant of a younger brother of Sir William Temple (q. v.), the diplomatist and litterateur, and a farther ancestry has been claimed for him extending to a period before the Norman Conquest. The second viscount, P.'s father, married the daughter of a Dublin tradesman, and P. was born at Broadlands, near Romsey, Hants, October 20, 1784. He received the rudiments of his education at Harrow, from which in his sixteenth year he went to Edinburgh, residing with Dugald Stewart for three sessions. In 1803 he entered St. John's, Cambridge, where he made a respectable appearance at college examinations and received approval for the regularity of his conduct. By the time he had taken his degree (1806), both his father and mother were dead. Being asked to stand for the University he did so, but considered it a sufficient honour to come in at the bottom of the poll with even a moderate share of support. After standing for Horsham and again for Cambridge, P. was returned for the pocket borough of Newtown in 1807, 'on condition,' he afterwards wrote, 'that I should never, even for the election, set foot in the place.' Under the Tory administration of the Duke of Portland he was enrolled as a junior Lord of the Admiralty the same year, and made his maiden speech upon the Copenhagen Expedition, defending it in some passages of sound sense which he had committed to memory. He was offered the Chancellorship of the Exchequer in 1809, but declined it, and became Secretary at War. While mastering the details of the office with industrious zeal, he succeeded before long in making it what he called 'a sort of barrier between the military authority of the officers in command of the army, and the civil rights of the people.' In 1811 Cambridge accepted him as her representative, which he remained for twenty years, and on the death of Perceval in 1812 he continued at his place in Lord Liverpool's ministry. Though allied with the Tories, P. from henceforth consistently wrought for Catholic Emancipation, until the question was settled. In the House of Commons he gradually developed a formidable power of debate, the chief characteristics of which were shrewdness, tact, and humour. As he rose into eminence he also became known as a man of the world and a man of 'pleasure, but his turf and society engagements never stood between him and his duty. On the 8th of April 1818, he was shot at the War Office by a mad lieutenant, but made a speedy recovery. Meanwhile within the Cabinet two factions had grown, and P. being in sympathy with the one headed by Canning, joined his government on the death of Lord Liverpool in 1827. He had now drifted away from the Tories, though he took office both with Lord Goderich and the Duke of Wellington because the Catholic question was left open (1828). By 1830 he had made up his mind to adopt the programme of reform, and in the same year joined the Cabinet of Earl Grey as Secretary for Foreign Affairs. It was in that office that P. earned his peculiar fame. Fired with the conviction that England was the greatest of the nations of the world, he conducted his correspondence with ambassadors and plenipotentiaries on a principle of high national self-assertion. Questions of the first importance rose for settlement. On the one hand he had to oppose the unbending Conservatism of the governments of Austria, Prussia, and Russia, and whilst deprecating the revolutionary spirit, to do what he could for Liberal constitutions in France, Spain, Portugal, and Belgium. His diplomacy succeeded in establishing cordiality for the first time between England and France, it assisted Belgium to become a neutral state, and queens (Isabella and Maria) were secured to the constitutions of Spain and Portugal. Then in 1837, when it became apparent that France desired the suzerainty of Egypt, he had to use the Powers he previously opposed in order to curb the ambition of his former

ally. In 1841 along with the rest of the Whigs he went out of office on the question of free trade. It was 1846 before he again took the same seals in the ministry of Lord John Russell, but he had to deal with such questions as the Catholic and Protestant quarrel in Switzerland, the Spanish marriages, the revolutions of 1848, and the Greek insults offered to British subjects. In December 1851 he retired from the Cabinet because his hasty recognition of the *coup-d'état* in France offended the Queen and 'the Power behind the throne.' Meanwhile he had changed his seat from Cambridge to Bletchingley, and South Hampshire, and from thence to Tiverton. In 1839 he had married the widow of the fifth Earl of Cowper, a daughter of Viscount Melbourne. P. was Home Secretary in the coalition government of Lord Aberdeen in 1852, and discharged his duties with conspicuous care, the ticket-of-leave system and the extension of the Factory Acts being among his achievements at that time. On the fall of the Aberdeen government P. was asked (February 1855) to become Premier, a position he occupied, with the exception of a Conservative interlude of some months, until October 18, 1865, when he died. During that time he prosecuted the Russian and Chinese wars with success. No English minister has ever probably enjoyed in his own country the same measure of popularity as P. His aggressive yet magnanimous nationality, and his exalted estimate of the respect due to British citizenship in all parts of the world, may primarily account for it; but his straightforwardness, his undeviating good sense, and his imperturbable good-humour helped to deepen and strengthen the admiration of his country. His sympathies, too, though they never took ideal flights of language, were always generous, and on the side of freedom and progress. See *Life of Henry John Temple, Viscount P., with Selections from his Speeches and Correspondence*, by Lord Dalling and Bulwer (3 vols. 1870-74); its continuation by Hon. Evelyn Ashley (2 vols. 1876), *Life of Prince Consort*, by T. Martin, vol. ii. and iii. (1876-77), and W. M. Torrens' *Memoirs of Viscount Melbourne* (1878).

Palmer-Worm, the name given to the larvæ or caterpillars of various *Coloptera* or beetles. It is used in the English version of the Scriptures as the equivalent of the Hebrew *gazam*—the *kampe* of the Septuagint—which many writers understand to denote the young of the locust.

Palmetto is a common name for several of the fan-palms, but especially for *Sabal P.*, a native of the coast district of the United States from Florida to N. Carolina. It grows to a height of from 30 to 40 feet, producing large fan-shaped plaited leaves, irregularly branched flower spikes of small greenish flowers, and dark green fruits containing single horny seeds. The leaves are manufactured into hats. The porous wood is very durable, and is not attacked by insects. It is also very tough, for which reason it has been used for stockades. *Palmetto* is collected from the spathe, and the 'cabbage' or unexpanded leaves is eaten and considered a delicacy. In the civil war of America the Confederate States chose the P. for their emblem. The soft interior of the dwarf P. (*S. Adansoni*) is edible. The Royal P. (*S. umbraculifera*) of the W. Indies attains a height of 80 feet.

Palmetto Leaves is applied to the large fan-shaped leaves of the Palmyra Palm (q. v.) (*Borassus flabelliformis*). They measure as much as 10 feet, including the stalk, and have a diameter up to 5 feet, consisting of sixty to eighty segments. Besides their employment for writing upon with a pointed iron style, they are used as thatch, and for mats and basket-work.

Palmpiedes (Lat. 'palm-footed,' hence 'broad' or 'web-footed'), a term formerly used to denote the order of swimming-birds, in which the toes are more or less completely webbed. It is now superseded by the term *Natatores* (q. v.).

Palmitic Acid ($C_{16}H_{32}O_2$), one of the fatty acid series, prepared from palm oil by saponification with caustic potash and subsequent decomposition with sulphuric acid. It occurs in many natural fats, in frequent association with stearine. It is solid and lighter than water, and has no colour, taste, or smell. Its solutions in boiling alcohol or ether are acid, and solidify, or, if dilute, yield slender needles of the substance on cooling. It is insoluble in water. It melts at 62°, and may be boiled and distilled almost without change. It forms normal salts, *palmitates*, in which an atom of the hydrogen is replaced by an

equivalent of a metal. Excepting potassium and sodium palmitates, all are insoluble in water or alcohol, and are obtained by precipitation from the double decomposition of a metallic salt and an alcoholic solution of the sodium or potassium palmitate. The alkali-metal compound may be obtained by the action of caustic potash upon palmitin, which is a natural fat, obtained by cautiously pressing palm oil and crystallising from hot ether. Its formula is $C_{15}H_{31}(C_{16}H_{33}O_2)_3$, so that it is a palmitate of the compound radical glyceryl (C_3H_5). See GLYCERINE. It melts at from 46° to 63° C., according to the allotropic modification in which it exists. Prepared artificially it is known as tripalmitine, to distinguish it from monopalmitine and dipalmitine, whose formulae are respectively $C_3H_5(C_{16}H_{33}O_2)(OH)_2$ and $C_3H_5(C_{16}H_{33}O_2)_2(OH)$, both of which are obtained by heating P. A. with glycerine in sealed tubes. The tripalmitine is prepared by mixing 1 part of monopalmitine with 10 parts of P. A., and keeping the mixture at a temperature of 250° C. for two days.

Palm Oil. See OIL PALM.

Palms (*Palmaceæ* or *Palmeæ*) constitute a large and most important order of monocotyledonous plants, estimated to number upwards of 700 species, abounding in the tropical regions of the world, and having outliers in the warm temperate zone; e. g., *Chamærops humilis* in the N. hemisphere reaches the Riviera near Nice in 43° , and grows well in Cornwall; *Cocos Australis* extends south from Brazil to Uruguay and the La Plata States; and *Areca sapida* in New Zealand reaches $38^\circ 22'$ S. lat. There is much diversity in the order. The stem is either under ground or above ground: in the former case it is a perennial rhizome producing flower-stalks and tufts of leaves; in the latter, it is either erect, scandent, or supported by other trees or bushes. Its structure (explained under ENDOGENS) renders the outer portion the hardest, and the cellular tissue of the centre frequently decaying, the stem often becomes hollow. As regards surface, in one group of P. it is smooth and shining, marked with raised rings where the leaves have fallen; in another it is rough with the persistent base of the petioles. The leaves of seedlings are always undivided; those that are formed later are generally either pinnately or palmately divided, the pinnæ or segments being linear or lanceolate, and mostly folded longitudinally, with numerous parallel veins. The petiole is always broad-based, and generally sheathing. The inflorescence is generally a panicle, enclosed in its young state by a large sheathing bract (*spathe*), the common peduncle (*spadix*) being often branching, thick, and sometimes woody. The flowers, by abortion of stamens or pistils, are generally dioecious, monœcious, or polygamous—rarely hermaphrodite. Calyx and corolla, as a rule, each consist of three segments; the stamens are generally six; the ovary three-celled; the fruit a one or three-seeded drupe or berry; the seed albuminous; the albumen cartilaginous, horny, or oily; the embryo minute, and cylindric. The properties of P. are very various. In the countries in which they grow they are used for supplying food, clothing, and for forming habitations. The fruit of some is edible, while that of others is extremely hard. Many yield oil, wax, starchy matter, and sugar, which is fermented so as to produce an intoxicating beverage. The fibres are employed for ropes, and the 'reticulum' surrounding their leaves is sometimes manufactured into brushes. See ASSAI, ARRACK, TODDY, JAGGERY, COIR, PIASSABA.

The order is commonly divided into six tribes, of which it will be only possible to notice here a few of the most important species, and such as are not described in separate articles. (1) *Borassinae*, with fan-shaped leaves and unisexual flowers. Besides the Palmyra P. (q. v.) and the Doom P. (q. v.), the Coco de Mer or Double Cocoa-nut (*Lodoica Sechellarum*) belongs to this tribe. It is found only on two or three small rocky islands of the Seychelle group. The tree is one of the tallest and most remarkable of the Palm family, attaining 100 feet in height, though scarcely a foot in diameter. The nut—formed, as it were, of two firmly united together—weighs as much as 40 lb., and takes nearly ten years to come to maturity. It is made into various domestic utensils, the wood also is valuable, and the leaves are manufactured into hats, baskets, &c. (2) *Coryphinae*, with fan-shaped leaves, bisexual or polygamous flowers, and compound panicles. See CHAMÆROPS, CARNAUBA, MAURITIA, TALIPAT P. The *Chamærops excelsa* of Japan and N. China is a most useful plant; the leaves are

made into hats and waterproof cloaks, and rope is manufactured from the inner fibrous layer of the sheath. The delicate young leaves of a species of N. W. India (*C. Ritchiana*) are eaten as a vegetable, and when developed, rope is made from them, also fans, baskets, sandals, pouches, brushes: the seeds are pierced and strung into rosaries. (3) *Phaniceinae* is represented by the well-known Date P. (q. v.), and in addition to the various species enumerated in that article, the African *P. spinosa* merits mention. It is common over the central regions of the continent, and on the coast, both as a bush and a tree with a flexuous stem 20 feet high. The green bunches of fruit, if immersed for twelve hours in water, suddenly assume a rich scarlet hue, and the astringent pulp becomes sweet. The split leaf is made into fine mats and caps, which take colour easily, and are worked into many patterns. (4) *Areceinae*, with pinnate leaves, having the leaflets entire or irregularly lobed, sheathing petioles, and monoecious flowers; contains genera referred to under BETEL, CABBAGE P., WAX P., CARYOTA, ARECA, GOMUTO. (5) *Coccoinea*. In this tribe the leaves are pinnate, the leaflets entire, the petioles amplexicaul with a fibrous base, and the flowers monoecious. The most important are *Cocos* and *Elæis*—already noticed under Cocoa P. and Oil P. (6) *Lepidocaryinae* has leaves pinnate, leaflets entire, petioles on long sheaths, both they and the sheaths beset with prickles; a flower monoecious or dioecious in compound panicles. In this tribe are included the rattans, and other useful plants of the genus *Calamus* (q. v.). Sago (q. v.) is chiefly the produce of several species of *Metroxylon* (*Sagrus*).

Two remarkable genera, which resemble P. in general habit and in their large pinnate leaves, but differ essentially in the structure of their flowers, and are not included in the above synopsis, are *Nipa* (q. v.) and *Phytolapha*, or the Ivory P. (q. v.). The different aspect of P. to other trees led to their being early sought after as objects of horticultural curiosity, and now palm-houses are especially erected for their reception and culture. Such may be seen at the Botanic Gardens of Kew, Edinburgh, Dublin, and many continental and colonial cities. See *The Geographical Distribution of P.* by Oscar Drude in the *Mittheilungen* of January 1878, and *Les Palmiers* by Oswald de Kerchove de Denterghem (Par. 1878).

Palm Sunday is the Sunday before Easter, which received its name from the practice of carrying palm (or, in northern latitudes, box, yew, or willow) branches in procession, in commemoration of our Saviour's triumphal entry into Jerusalem, on which occasion, according to John (xii.), many of the Jews took branches of palm-trees and went out to meet him. At the same time there can be little doubt that in the rites of the day the Church adopted part of the pagan ceremonies connected with the rejoicings of Easter (q. v.)—a part which was long kept up in connection with May-day (q. v.), when the young people went out to the woods during the previous night and returned in the morning laden with branches of trees decorated with flowers.

Palmyra is the Greek name (perhaps compounded of *palma*, 'a palm-tree,' and Arab. *mur*, Gr. *myron*, *myrra*, 'an aromatic gum') of the city Tadmor (Heb. 'city of palms'), which was situated in a well-watered oasis in the Syrian desert, about 150 miles N.E. of Damascus, serving as a dépôt for the merchandise of India, Persia, and Arabia, in its transmission to the West, and a safe halting-place for the caravans. That P. was built by Solomon, as stated in 2 Chron. viii. 4, is doubtful. The city mentioned in the parallel passage in 1 Kings (ix. 18) is Tamar (Heb. 'a palm'), which is probably the city to the S. of Palestine mentioned in Ezek. xlvii. 19 (cf. the other towns mentioned in the passage), Tadmor being introduced on the margin from Chronicles. The first mention of P. in profane history is when it attracted the attention of Marc Antony (about A.C. 40), who expected rich spoil from it; but the inhabitants transported their wealth beyond the Euphrates. In the time of Pliny (about A.D. 70), P., with a certain territory, formed an independent state between the Roman and the Parthian Empires, and the great emporium of the Eastern trade; but it was soon after united to the Roman Empire as a free city. Under Adrian (from whom it received the name of Adrianopolis) and the Antonines it rose to the height of its splendour, but was laid waste by Aurelian after the rebellion of Odenathus and Zenobia (q. v.; 3d c.). It was again fortified by Justinian in the 6th c., it was one of the first conquests of the Saracens in Syria (632), and was plundered by Tamarlane (1400). All that remains of it at the present day

are vast masses of ruins, amid which several families of Arabs have their huts, and retain possession of the place. See St. Mart's *Histoire de Palmyre* (Par. 1823), Porter's *Handbook of Syria and Palestine* (Lond. 1858), Vogüe's *Syrie Centrale* (1869), and Baedeker's *Handbook of Syria and Palestine* (Lond. 1877).

Palmyra Palm is the name of *Borassus flabelliformis*, a plant widely distributed throughout the tropical parts of Asia either in a wild or cultivated state. It belongs to the section of palms with fan-shaped leaves and unisexual flowers in panicle spikes. The young stems are covered with dry leaves, or the lower part of the petiole, and the old stems bear the scars of the fallen petioles. The leaf consists of from 60 to 80 parchment-like, smooth, shining segments. The sub-globose fruit, which is about 6 inches in diameter, contains a yellow pulp mixed with tough fibres surrounding the seeds. Sometimes the tree attains 100 feet in height, but it is generally about 50 feet, and has a diameter of 18 to 24 inches. The stems are hollowed out in India and employed as water-pipes; cut half-way through lengthwise, they serve as gutters and open channels. The outer wood is used for posts, rafters, and building generally, also for furniture. The leaves are employed for writing upon (with pointed iron style), the documents lasting for several centuries; they are also used for thatch, mats, and basket work. The pulp of the fruit is eaten raw or roasted, and in Ceylon a preserve is made from it. The unripe seed and the seedling plants are an important article of food. But the most valuable product of the tree is the sweet sap which runs from the peduncles cut before flowering, and is collected in bamboo tubes or earthen pots tied below the wound. Nearly all the sugar made in Burmah and a large portion of that made in S. India and the Konkan is the produce of this palm. The sap is also fermented into toddy and distilled. An African species (*B. Ethiopum*, the 'Deleb' of Nubia) is widely diffused over the tropical part of that continent, forming a marked feature in the landscape whether it occurs singly in a forest or forms a monotonous plantation covering miles of flat land. It is the largest of the E. African palms, growing on the Zambesi to a height of 80 feet, and at about half its height the stem is generally much swollen, a prototype perhaps of the bulged shaft of the old Egyptian column. The wood if kept dry is durable, resisting well the attacks of termites. See DELEB PALM.

Palmyra Wood is a name given to the timber of the hard outer parts of the trunks of the cocoa-nut palm and the Palmyra palm. The peculiar arrangement of the vascular bundles in their connection between the interior of the stem and the base of the leaf, and the varied structure of these bundles, give a remarkable appearance to the wood. Veneers cut in the horizontal direction are known in the trade as 'speckled wood,' and those made vertically as 'porcupine wood.' It is used in the manufacture of numerous fancy articles, such as ladies' work-boxes.

✓ **Palo'lo** (*P. viridis*), also named 'Balolo,' the name applied to a species of *Annelida* (q. v.) or worms, belonging to the order *Errantia*, or that including the most typical marine worms. It inhabits tropical seas, and is common around the Samoan and Fijian coasts. The average length of the P. is about 3 inches. It is of a greenish colour and has a cylindrical body which tapers at both ends. The gills are represented by tufts borne on the sides of the segments of the body. The natives of the islands first mentioned regard the P. as a delicacy, and capture it in large numbers at certain periods of the year.

Pal'pi (from Lat. *palpo*, 'I touch'), the name given to certain appendages developed in connection with the mouth-parts of *Articulate* or *Annulose* animals. Thus in insects P. are borne by the second pair of jaws or *maxilla* and by the *labium* or lower lip, but the larger jaws or *mandibles* are never provided with these organs. In Crustaceans (e.g., lobster) P. are attached to the *mandibles*, to the *maxilla*, and also to the *maxillipedes* or foot jaws. The P. in *Arachnida* or spiders and scorpions are large and important. They belong in the latter class to the *maxilla*, and are used by the males to convey the seminal fluid to the female generative organs. In the scorpions the maxillary P. are developed to form the *chela* or nipping-claws.

Palpitation is the term used to express frequency of cardiac action, irregularity, and suddenness of impulse. P. may be either functional or a symptom of organic disease of the heart, and, as a rule, the symptoms which accompany the P. without organic disease are flushings or pallor of the face, ringing in the ears, or some

coldness of the extremities. P. may be persistent, but it is more generally paroxysmal, and the causes are most frequently traceable to excessive mental exertion and sedentary occupation, great anxiety, strong mental emotions, nervous exhaustion, the influence of poisons on the heart's action, and derangement of the stomach and liver. The causes being removed the P. is removed, but the heart may become hypertrophied or dilated through the chronicity of the P. P. due to organic disease of the heart is a much more serious affection, and repeated examinations of the patient are often necessary to arrive at a correct conclusion regarding the nature of the disease. See HEART, DISEASES OF.

Pal'sy. See PARALYSIS.

Paludal Diseases. See Miasmatic Diseases.

Paludan-Müller, Frederik, was born at Kjertermind in Zealand, and educated at the Cathedral-school of Odense and at Copenhagen University. His first works, *Fine Romancer* (1832), and *Kjerlighed ved Hoffet*, had already considerable success, when the beautiful poem *Danserinden* (1833) gave him the high place he afterwards maintained by *Amor and Psyche* in 1834, and from 1835 to 1838, when he travelled to Italy, by *Zulcimas Flugt*, *Eventyr i Skoven*, *Alf og Rose*, *Trochaer og Lamber*, *Fyrste og page*, *Beatrice*, *Vestralinden*, and *Slaven*. The latter year closed his first or 'æsthetic period,' while the drama *Venus* (1841), and the first part of his greatest poem, *Adam Homo* (1841-48), appearing after his return, are the expression of his second or 'ethical period.' Two mythological poems, *Tithon* and *Dryadens Bryllup*, lead on to the third, or 'religious-speculative' period, whose chief works were *Lufstskifferen og Atheisten* (1852), *Kalanus*, *Paradisct*, *Abels Død*, *Kain eller Vredens Barn*, *Ahasverus*, and *Benedict og Hans Amme*. *Ivar Lykkes Historie*, the comedy *Tiderne Skifte* (1874), and the poem *Adonis* (1874) were his last works. He died 28th Dec. 1876. P.-M. is one of the greatest of Danish poets. His characteristics are a high moral earnestness, a richly developed power of reflection, and transparent clearness of style.

Paludina, a genus of *Gastropodous Mollusca* (q. v.), forming the type of the family *Paludimida*, in which a conical or globular shell exists with a rounded and entire or unbroken aperture. The *Operculum* (q. v.) is horny or shelly. These gastropods are inhabitants of fresh or brackish waters. P. is represented by living species, of which *P. vivipara* is a good example. The fossil representatives of the genus begin in the Jurassic or Chalk formations.

Palunpur, the capital of a native State of the same name in W. India, in political connection with the Bombay Government, 80 miles N. of Ahmedabad. It has a special manufacture of chintz counterpanes. Pop. (1872) 17,189.—The State of P., which lies between Gujerat and Rajputana, has an area of 2384 sq. miles, a pop. (1872) of 215,972, and a revenue of £40,000, of which £4550 is paid as tribute to the Gaekwar. The crops are rice, wheat, and sugar-cane. The ruling family are Afghans, who received the title of Dewan from the Emperor Akbar. The higher title of Nawaub, offered by the British for services during the Mutiny, was refused.

Pamlico, or **Pamplico Sound**, the largest sound on the coast of N. Carolina, 80 miles long by 10 to 30 broad, is fenced by long low islands from the open sea, to which it opens by Ocracoke, Hatteras, Loggerhead, and other inlets. It receives the Neuse and P. rivers, communicates with Albemarle Sound in the N., and has an average depth of 20 feet, with great areas of shoal water. Its fisheries are valuable.

Pam'pas (in the Quichua tongue, 'plains'), the name given to the wide plains forming almost the whole of the Argentine Republic and part of Paraguay. They are composed of an estuary deposit, and are largely impregnated with salt, while large lagoons, more or less saline, are of frequent occurrence. Bones and other animal remains are so abundant, that Mr. Darwin says 'We may conclude that the whole area of the P. is one wide sepulchre of extinct gigantic quadrupeds.' Strips of barren land, of different geological character, and called *travesias*, cross the P. in some places. The P. themselves are covered with long grass, and in some districts for two-thirds of the year with thistles eight feet high, which afford shelter to robbers, and also serve as fuel in a country destitute of trees and coal. Large flocks of sheep are now reared on the P., over which also roam immense herds of wild cattle and horses. The latter have largely supplanted the

native fauna, which consisted chiefly of the guanaco, vizcacha, a rabbit-like creature, and the rhea, or S. American ostrich. The principal inhabitants of the P. are Indians, and the mixed race called Guachos (q. v.). The P. are liable to fierce blasts of westerly wind, known as *pamperos*, whose influence extends some distance out to sea.

Pampas Grass is the name applied to a genus of grasses botanically called *Gynerium*, brought into European notice by the introduction into gardens of the handsome species named *G. argenteum*. All the genus, with one New Zealand exception, is S. American, and the species above alluded to covers large areas of the Pampas district. Few ornamental plants produce a finer effect than good tufts of this grass, grown either singly on lawns, or arranged against a background of evergreens, which serve as a contrast to its large, elegant, silvery-white panicles and graceful leaf-disposition. In favourable conditions the stems rise to 12 feet high, with as many as 200 springing from a single plant.

Pamphilus, one of the most famous artists of ancient Greece, the founder of its most celebrated school of painting, and the instructor of Apelles, was born at Amphipolis, and flourished in the middle of the 4th c. B. C. In the school of P. the course of study, which embraced drawing, arithmetic, geometry, anatomy, and painting, extended to ten years.

Pamphlet (said to be from the Sp. *papaleta*, 'an inscribed slip of paper' or Lat. *pagina filata*, 'a threaded page'; but the derivation is uncertain), a short treatise or essay—technically, a book in octavo, of not more than five sheets, merely stitched together. The word occurs in Chaucer, and the P. was first wielded in England as a powerful weapon of attack by Wyclif. In the reign of Edward VI. a crowd of Protestant pamphleteers flooded the country with vehement invectives against the Mass and its accompanying superstitions. The attacks, directed by Nash and his rivals among the Elizabethan pamphleteers against the Puritans, were the first English works which shook utterly off the sickly extravagances of euphuism, and laid the foundation of popular literature. Milton's pamphlets are splendid specimens of wrathful protest and impassioned pleading. In later times, till the rise of the newspaper press in some measure superseded this form of publication, every controversy brought its budget of pamphlets. There are valuable collections of them in the libraries of the British Museum, and the Royal and London Institutions.

Pamphylia, anciently a province on the S. coast of Asia Minor, consisting of a narrow strip of land skirting in a semicircle the coast of the Bay of P. It was traversed by ramifications of Mount Taurus, and watered by the rivers Catarrhactes (*Dudensu*), Cestrus (*Ak-su*), Eurymedon (*Capri-su*), and Melas (*Menagat-su*), all of which are navigable and discharge into the Bay of P. The inhabitants were a mixed race of aborigines, Cilicians, and Greeks, hence their name 'Pamphyl' (Gr. *pas*, 'all,' and *phylē*, 'tribe'; cf. Ger. *Alemanni*). They were chiefly devoted to maritime pursuits, and, like the Cilicians, were much addicted to piracy. The chief towns, all on the sea-coast or on the rivers, were Side and Aspendus, originally Greek colonies, Attalia, founded by Attalus, king of Pergamos, and Perga.

Pamplona, the chief town of the province of Navarre, in N. Spain, 40 miles S.S.W. of San Sebastian, with which it is connected by rail, and 19 from the French frontier. Situated in a fertile plain 30 miles in circumference, on the left bank of the Arga, a tributary of the Ebro, on an eminence 1378 feet above the sea, it is strongly fortified, and has a citadel founded by Philip II. Though very uneven, the town is finely built, has three squares, of which Plaza del Castillo is the finest, an Episcopal palace and a Gothic cathedral, founded in 1397 by Carlos III. of Navarre, and containing the graves of the kings of Navarre. P. has a medical school, a college with a library and botanic garden, a *casa de expósitos* ('foundling hospital'), a theatre, and a *plaza de toros* ('bull arena'), the largest in Spain, capable of holding 10,000 people. There is some trade in wine, leather, linen, wax, and guitar-strings. Pop. 22,896. P., the ancient *Pompeopolis*, was taken by the Goths in 466, and by Karl the Great in 778. Its Moorish conquerors corrupted the Roman name to *Bamblona*, whence the modern P. It was taken by the French in 1808, but surrendered to the Duke of Wellington after the Battle of Vittoria, in 1813.

Pan (akin to Lat. *pasco*, 'I feed'), in Greek mythology a rural divinity, the son of Hermes by a daughter of Dryops, was originally worshipped in Arcadia, whence his fame extended to other parts of Greece. He was regarded as the guardian of flocks, pastures, and bees, as a mighty hunter, and as the inventor of the syrinx or *pandean* pipes; and in art was usually represented with goat's horns, beard, tail, and feet—attributes that struck the beholder with *panic* alarm (Gr. *to panikon*). By the Romans he was identified with Faunus (q. v.), and the Alexandrian philosophers saw in him a personification of nature, connecting his name with the Gr. *to pan* ('the universe'). The story related by Plutarch (*De Defectione Oraculorum*), how, on the night of the Nativity, a voyager off the promontory of Tænarus heard a strange cry, 'The great Pan is dead,' suggested to Milton the most beautiful stanzas in the *Hymn on the Nativity*; and the Lycean god has been sung by Beaumont and Fletcher, by Shelley, Keats, and Mrs. Browning.

Panache (Fr., Old Fr. *pennache*, Ital. *pennachio*, from Lat. *penna*, 'a feather'), in Heraldry, a plume of feathers placed upright in front of the helmet, and so arranged as to form a crest.

Panama, Isthmus of, connects Central and S. America, extending from 77° to 83° W. long. It forms the State of P., belonging to the Colombian confederation, and has an area of 29,756 sq. miles, with a pop. in 1871 of 220,542. The isthmus is traversed by a mountain range forming a continuation of the S. American Cordillera, and culminating in the peak of Picacho (7200 feet). In its eastern part and on the Atlantic shore there is a belt of low wet land with a very unhealthy climate; but the western portion rises into dry and comparatively healthy savannahs. The central range is rugged and precipitous, and is clothed with a rank tropical vegetation. Gold, iron, copper, and salt mines are partially worked, while the chief crops are rice, maize, cotton, and bananas. The isthmus is crossed by a railway 36 miles in length, connecting Aspinwall on the Atlantic, and the town of P. on the Pacific. It was constructed by United States enterprise, opened in 1855, and enjoys a transit trade of £11,000,000 yearly. The construction of a ship canal across the isthmus has been long discussed, and more than one survey for the purpose has been made.—P., the capital of the State of the same name, on the Pacific side of the Isthmus of P., and on the Bay of P., an inlet of the Atlantic. The sea at P. is so shallow that vessels are obliged to anchor from 2 to 8 miles from the shore, under the lee of several small islands. The town is well-built, but has frequently been devastated by fire, the last disaster of the kind occurring in 1874. P. is a free port, but derives its chief importance from being the Pacific terminus of the P. Railway, and consequently enjoying a large transit traffic. The chief exports are indiarubber, hides, skins, and ivory nuts. In 1873 the value of the exports from P. amounted to £400,000, but fell to about half that figure in 1874, in consequence of Indian troubles. The old Spanish city of P., built in 1518 and destroyed in 1670 by the buccaneers, stood 6 miles N.E. of the present town, whose pop. in 1871 was 18,378.

Panathenæa, the greatest and probably the most ancient festival of the Athenian State, was celebrated in the month of July at Athens in honour of Athene Polias. Strictly speaking the P. consisted of two festivals, the one held annually under the name of the Lesser P., the other every four years under the name of the Greater P. The P. seems to have been a development of the feast Athenæa, instituted, according to tradition, by King Erichthonius about 1500 B.C., and originally confined to the city of Athens, but on the formation of the Attic confederacy by Theseus opened to all the Atticans, and receiving on that account the name P. The celebration included rich sacrifices of oxen, to which every town in Attica had to contribute one bull, besides various contests of skill, horse and foot races, and the *lampadephoria*, or torch-race. The Greater P. was distinguished by the more magnificent character of its sacrifices, by the recitation of the Homeric and other poems, and especially by the solemn procession of all Atticans on the last day of the festival to the temple of Athene Polias, for the purpose of presenting the goddess with the *peplos*, a crocus-coloured garment wrought by the maidens of the city. This procession, and other solemnities of the P., are represented on the frieze sculptures of the Parthenon now in the British Museum.

Pan'ax. See GINSENG.

Pan'cakes are cakes fried from a thin batter of flour, eggs, and milk, seasoned with salt and sugar. The following is M. Soyer's recipe for P.: 'Break two to four eggs into a basin, add four small tablespoonfuls of flour, two teaspoonfuls of sugar, and a little salt; beat the whole well together, adding by degrees half a pint of milk, or a little more or less, depending on the size of the eggs and the quality of the flour, so as to form a rather thick batter; next add a little ginger, cinnamon, or other flavour at will; lastly, put them into the pan, and when set and brownish, lay hold of the frying pan at the extremity of the handle, give it a sudden but slight jerk upwards, and the cake will turn over on the other side; when this is brown, dish up with sifted sugar and serve with lemon.' The use of P. is peculiarly associated with Shrove Tuesday, and this observance is supposed to be a relic of an ancient heathen festival continued in connection with the calendar of the early Christian Church.

Panchatan'tra. See BIDPAI.

Pan'creas (Gr. *pan*, 'all,' and *kreas*, 'flesh'), or **Sweetbread**, an organ of the higher vertebrata, situated in the abdominal region as an appendage to the digestive system. The P. in man lies somewhat transversely in the abdomen, or across the hinder wall of the belly, in the *epigastric* and *hypochondriac* (right and left) regions. It is a gland of oblong and flattened form, and has been compared in shape to a dog's tongue. It is broadened at its right extremity, is from 6 to 8 inches long, 1½ inches broad, and half an inch to an inch thick. It weighs usually from 2 to 3½ ounces, but 5 or 6 ounces is not an uncommon weight. The right extremity of the P. is covered by the bend of the *duodenum*, or first portion of the small intestine. Its body is covered in part by the posterior surface of the stomach; and the left extremity or 'tail' of the organ extends to the spleen, and overlies the left kidney.

The *structure* of the P. is strikingly similar to that of the *salivary glands* of the mouth. There is a loose and irregular division into lobules, which are in turn composed of ramified tubes. The secretion of the P. is conveyed from the organ by the *pancreatic duct*, which runs through the organ from left to right, and which opens into the *duodenum* in close relationship with the bile-duct from the liver. This duct is of the size of a quill at its intestinal end. The P. derives its *nerves* from the splenic plexus. The *arteries* of the P. arise from the splenic, &c., and the *veins* open into the splenic and superior mesenteric veins.

The *pancreatic juice*, or secretion of the P., like *saliva*, is a colourless, transparent, and alkaline fluid. Its specific constituent is *pancreatin*. In 100 parts of pancreatic juice there are of water 98.45 parts, and of solids, 19.55 parts. The solids consist of pancreatin, 12.71 parts; and of inorganic bases and salts, 6.84 parts. The functions of the pancreatic juice in digestion comprehend (a) the conversion of *starch* into *dextrin* and *grape sugar*, an action which the bile is powerless to effect; (b) to aid in the assimilation of *fatty matters*, by transforming them into an emulsion and thus rendering them fit for absorption by the lacteal vessels. In *Disease of the P.*, fatty and oily matters appear to be but imperfectly digested—(c) the dissolution of *albuminous matters*, and the production of a peptone, similar to that formed by the action of the *gastric juice*.

Pan'sova, a fortified town of Austria on the Serbian frontier and on the Temes, near where it enters the Danube, 12 miles N.E. of Belgrad. It has an important trade in grain and cattle, and considerable industries in silk, brandy, &c. Pop. (1869) 13,408.

Pan'da or **Wah** (*Ailurus fulgens*), a species of *Carnivorous quadruped* found in Nepal, and allied to the raccoon, possum, &c. It attains a length of about two feet; its colour is a rich chestnut brown, deepest in hue on the outside of the body and legs; the head is greyish, and there is a whitish spot below each eye. The tail is ringed, the head short and broad, and the muzzle pointed. The soles of the feet are hairy. The P. appears to feed on birds and smaller mammalia. It is also fond of eggs, and robs nests to procure these dainties. The names 'Wah' and 'Chit-wa' are given to the animal from its cry.

Pandana'cese, or the **Screw-Pine Family**, is a singular natural order of monocotyledonous plants, numbering about 100

species, chiefly contained in the genera *Pandanus* and *Freylinia*. The stem is arborescent, usually sending down aerial roots, sometimes weak and decumbent; the leaves imbricated in three rows, long, amplexicaul, and almost always spiny on the margins; the flowers dioecious or polygamous, and arranged on a covered spadix; the perianth wanting; and the fruit either fibrous drupes or many-celled berries. They are abundant in the Mascaree Islands, common in the Indian Archipelago and most tropical islands of the Old World, but are rare in America. Their strong aerial roots, which protrude from the stem, descend towards the earth, and reaching it, quickly bury themselves in the soil, are not only a source of nourishment but act as stays to prevent the stems being blown about in the sandy situations where the plant is usually met with. The fruit and seeds of many species are eatable, and their leaves furnish cordage and thatching material. From the unexpanded leaves of *Carludovica palmata*, the Panama hats are manufactured. Jipagapa in Ecuador is the principal seat of the trade—not Panama, which is a misnomer in the same way that 'Mocha' is for coffee. See SCREW-PINE.

Panda'vas are the five sons of Pandu, whose life and war with the rival Kaurava princes form the subject of the celebrated Hindu epic the *Mahabharata* (q. v.). It is supposed that this war has some historic basis, but it is now impossible to discriminate it.

Pande'an Pipes, an ancient wind instrument formed by a number of reeds of graduated lengths. The Greek *Syrinx* and Roman *fistula* were of this nature.

Pan'dects (Gr. *pan de kai*, 'all-receiving'), the name given to a digest of the Roman law, made by the order of the Emperor Justinian. It consists of fifty books containing the opinions and writings of eminent lawyers. The books are divided into seven parts, which are as follows:—1-4, 5-11, 12-19, 20-27, 28-35, 36-44, and 45-50. The first contains the elements of law, defining justice, right, &c.; the second part treats of judges and judgments; the third of personal actions; the fourth of contracts, pledges, &c.; the fifth of wills and testaments; the sixth of the possession of goods; and the seventh of obligations, crimes, punishments, &c. The P. were compiled by Tribonian during the years 529-33. See ROMAN LAW.

Pandemic Waves of Disease. In 1858, Dr. Lawson, Inspector-General of Hospitals, while in charge of the Medical Department of the Army in Jamaica, investigated the records of mortality to ascertain whether they indicated the operation of local causes which might be removed. He says:—'After much consideration, I was led to the conclusion that epidemics proceeded regularly from south to north, and that they might be traced from the Cape of Good Hope to Iceland. They succeeded each other at the interval of a few years, and often affected places far distant in longitude; and their resemblance to a succession of waves led to their causes being designated P. W. As the course of these waves seemed uninfluenced by atmospheric currents, it was clear they must be owing to some terrestrial force; and their appearance at Mauritius and the Cape in the same year, and their subsequently manifesting themselves at more northerly latitudes on the eastern side of the Atlantic than on its western shore at the same time, taken in connection with the position of one of the magnetic poles to the N. of Canada and the S. of Australia, rendered it probable that the force was magnetic.' In regard to the progress of P. W. in the production of fevers and cholera, Dr. Lawson states that 'they take five years to go from the Cape of Good Hope to England. A febrile wave is supposed to start from the isoclinic, 70° S., on the 1st of January of a year with an odd number, and to overspread the zone between that and 53° in the course of the year. It will start from 53° on the first of January of the even year, and so on. As the waves are assumed to occur every second year, another will leave the isoclinic, 70°, in the next year, and will pursue the same course as that which preceded it. From this peculiarity, it follows that the first part of a wave is experienced in any given zone either always in an odd year or always in an even one. And the force of the epidemics is accordingly felt in each zone in the year peculiar to it, following that of the zone to the south of it, and preceding that of the zone to the north.' The theory of P. W. is not generally received by epidemiologists, and requires confirmation. See *Trans. Epidem. Soc.* (vol. iii. p. 216, Lond.).

Pandora (Gr. 'all-gifted'), according to Greek myth, was the name of the first woman on earth. After the theft of fire from heaven by Prometheus, the wrathful gods in revenge caused Hephaestus to mould a woman of surpassing beauty, whom they endowed with every seductive gift, and sent as a present to Epimetheus, brother of Prometheus. Epimetheus, despite the warning of his brother, received P., whose curiosity prompted her to open a box or cask which stood on the threshold of the house, whereupon there issued from it all the varied evils that afflict mankind, Hope alone remaining behind. The details of this myth are variously given and interpreted.

Pandours (from Pandur, a village near Kolocza), the name formerly given in the Austrian army to corps of light-armed foot, levied from among the Slavs on the Turkish frontier, and acting under their own leaders, called Harumbashas. Since 1755 the P. have been incorporated with the other frontier forces of the Austro-Hungarian Empire.

Pan'el, in English law, is the slip or 'pane' of paper or parchment containing the names of the jurors returned by the sheriff, or other ministerial officer, to serve on trials of issue in courts of law. The enrolment of the names upon the schedule is called *impanelling a jury*; and the returning officer is said to *array* the names on the P. In Scotch criminal law the accused, who is called the defender till his appearance to answer to the charge, is, after appearance, termed the P.

Pan'el (Old Fr., a diminutive of *pan*, 'a piece or pane,' Lat. *pannus*), in architecture, denotes a compartment with raised margins, as in wainscotings, ceilings, and the like. Panels are a common feature in the ornamental stone-work of Gothic buildings. They appear to a certain extent in the Norman style, have greater variety in the Early English, while in the Perpendicular style walls and ceilings are sometimes entirely covered with them in every variety of form. In modern buildings, panelling is chiefly employed in plaster-work and wainscotings.

Pan'fish, a name applied to a species of king crabs (*Limulus cyclops*) found in the E. Indies, where it is also known as the 'saucpan crab.' When limbs and tail have been removed, the buckler-shaped body or shell presents some slight resemblance to a saucpan.

Pan'ge Lin'gua (Lat. 'proclaim, O tongue'), a Latin hymn in honour of the Eucharist, written by Thomas Aquinas (q.v.), forms part of the service in the Roman breviary for the festival of Corpus Christi; and two verses, commencing *Tantum ergo Sacramentum*, are sung at the Benediction with the Blessed Sacrament.

Pan'golin, or **Ma'nis**, a name given to a genus of *Edentate* mammals allied to the Armadillos, and included in a special family, that of the *Manidae*. They are almost the only members of Edentate order found outside S. America; being natives also of Africa and India. Two well-marked species are the Phatagin long-tailed manis (*Manis tetradactyla*), and the short-tailed manis (*M. pentadactyla*). The latter is sometimes distinctively named the 'Pangolin.' It occurs in India and Ceylon. Its length is 5 feet, inclusive of the tail. The P. is covered with horny scales, which invest both tail and body. The toes are provided with strong claws, enabling the animal to burrow with ease.

Pan'iole. See INFLORESCENCE.

Pan'ioum. See MILLET.

Pan'ini, the great Sanskrit grammarian, who is said to have flourished in the 6th c. B.C., and whose work is still the standard authority among Hindus. It is divided into eight books, and is composed of nearly 4000 *sutras* or aphoristic verses. The system of grammar is entirely different to that with which we are familiar in Europe, being arranged not according to the parts of speech, but on the principle of classifying all cognate philological phenomena, such as the change of long vowels for short. The original, with commentaries, was published at Calcutta (1809) and at Bonn (1840). See P., *his Place in Sanskrit Literature*, by Prof. Goldstücker (Lond. 1861).

Paniput', a town in the district of Kurnaul, Punjab, British India, 78 miles N. of Delhi. It lies on the direct route from Western Asia into the heart of Hindustan, and has been the scene of two decisive battles. In 1526, the Timurian Baber (q.v.) defeated the Afghan Ibrahim, and founded the Mogul dynasty at Delhi; and again in 1761 the supremacy of the Mah-

rattas in N.W. India was broken by the Durani or Afghan emperor, Shah Ahmed. In the neighbourhood are many ruins and tombs. P. was at one time the headquarters of a British district of the same name. There is a special manufacture of glass ware. Pop. (1868) 25,276.

Paniz'zi, Sir Antonio, K.C.B., some time principal librarian of the British Museum, was born at Brescello, Modena, September 16, 1797, and was educated at Reggio and at the University of Parma, obtaining the degree of Doctor of Laws in 1818. An ardent Liberal in politics, he was implicated in the Piedmontese revolution in 1821, and although condemned to death he managed to escape, and after wandering in Switzerland and Germany fled to England. Obtaining an introduction to the historian Roscoe, who gave him warm encouragement and cordial assistance, he settled first in Liverpool, where he remained an Italian teacher of repute till 1828, when he became Professor of Italian in University College. In 1831, through Lord Brougham's instrumentality, he received an assistant librarianship in the British Museum, and succeeded in 1837 to the Keepership of Printed Books. Among his earliest important duties were the transference of the printed books from Montagu House to Great Russell Street, and the compilation of a new catalogue, his designs for the work having been approved by the trustees. To his painstaking efforts are due in a very great degree the obtaining of a large increase in the Parliamentary grants to the Museum, the trebling of the number of volumes in the library, and the formation of the unequalled Reading-Room (1855-57). P. was appointed Principal Librarian in 1858, and retired on full pay in 1866. He was created a K.C.B. in 1869. His literary labours include the editing of the *Orlando Innamorata* of Boiardo and the *Orlando Furioso* of Ariosto (9 vols. 1830-34), prefaced by an able essay; an edition of the *Sonetti e Canzoni* of Boiardo in 1835; and a splendid reprint at the expense of Lord Vernon of the first four editions of Dante's *Divina Commedia* (1858). He has also written a number of pamphlets and critical papers.

Panjim'. See GOA.

Panno'nia, a province of the Roman Empire, bounded N. and E. by the Danube, S. by Illyricum and Mœsia, and W. by Noricum and Italy. It comprised the territory now known as Lower Austria, Carinthia, Carniola, the S.W. of Hungary, Slavonia, and parts of Croatia and Bosnia. Its inhabitants were of Illyrian descent. First conquered by Octavianus, B.C. 35, they were completely subdued by Tiberius in A.D. 8, and by Drusus on their revolt after the death of Augustus, when he divided the country into P. Superior and P. Inferior, the boundary being a line drawn from Arrabona in the W. to Servitium in the S.; P. Superior lying W. of the line. In the 4th c. Galerius took from P. Inferior the part N. of the Dravus, but Constantine the Great equalised the provinces by adding to Inferior the S. part of Superior. The chief towns were, in P. Superior—Vindobona (*Vienna*), Carnuntum, Petovio (*Pettau*), Emona (*Ljubljana*), Siscia or Segesta (*Siszek*); in P. Inferior—Sirmium (*Mitrovitsa*), Mursa (*Essek*), Aquincum or Adincum (*Alt-Buda*), and Bregetium (*Komorn*).

Pann'us, or **Vas'culo-Neb'ulous Cor'nea**, is a vascular state of the cornea, with thickening of its epithelium, the result of chronic inflammation. Idiopathic P. is the result of corneitis, and the vascularisation of P. differs from other forms of vascularity in that the vessels proceed to the cornea from the conjunctiva and ramify upon the cornea in an irregular manner, with considerable intervals between them, the internal surface of the eyelid being smooth and natural. The blood-vessels of P. are also derived from those of the sclerótica, and they may pervade the whole of the lamellated tissue of the cornea to such a degree as to render it almost impervious to light. See OPHTHALMIA.

Panora'ma (Gr. *pan*, 'all,' and *orama*, 'a view') is, properly speaking, a painting which represents an extensive sweep of a landscape as viewed from one point, and is therefore disposed upon the concave side of a whole or half cylinder. The perspective of such a design is peculiar, and its execution difficult; but if well done the effect is splendid, and the optical illusion almost perfect. The inventor of the P. was Robert Barker (1739-1806), who first exhibited a panoramic view of Edinburgh in that city in 1788. The most successful in this department of

pictorial art, which has been almost wholly confined to the United Kingdom, was Robert Burford, who died in 1861. The term P. is often incorrectly applied to a *diorama*, which is simply an exhibition of a series of large landscape paintings viewed through an aperture. The diorama was invented by Daguerre and Bouton, and has been widely introduced as a public exhibition.

Panslavism, the movement towards Slavonic unity, is a modern growth, undreamt of by Catherine II. when she signed away to Prussia and Austria their shares of Poland. At the downfall of Napoleon's empire all Europe was seized with a passionate enthusiasm for nationality, which in Bohemia assumed the form of P. The philologues Kopitar and Shaffarick, the poet Kollar, and the historian Palacky, told each their tale of a mighty past, and literary and sentimental aspirations were quickened and extended by the misjudged attempts of the Prussian and Austro-Hungarian Governments to Germanise Poles and Czechs, and Magyarise Serbs, Slovaks, and Croats. The movement of the Western Slavs found a ready response among the down-trodden Slavonian subjects of the Porte, who with less to lose had everything to win. The first Panslavic Congress met with high hopes at Prague in 1848, the year of Kossuth's insurrection, and met to find that the sons of the 'Great Mother Slaveeys' could only make themselves mutually intelligible by means of detested German. But that and the succeeding year, by bringing Russian arms to quell a Magyar revolt, linked Russia with P., and raised the Czar to boundless popularity beyond his own domains. In Russia itself the Panslavic movement was hailed by widely different parties—by the Slavophiles, who in Western civilisation 'saw nothing but the darkness of ignorance and superstition;' by politicians, who fancied that the road to Constantinople was over Vienna; and by the 'Young Russia' party, whose interests lay in agitation. The bases of union proposed were as various as the parties proposing them—the Orthodox faith to be received alike by Protestant Czechs and Catholic Croats, a general acceptance of the Russian language, or the adoption of the communal system of the Russian villages. The Crimean War (1854-55) came as a sudden check to high-formed hopes and schemes, the 'great brother' proving weaker than men had supposed, and having enough to fill his hands at home. Accordingly Bohemia set itself to achieve its independent liberties; the Slavs of Hungary joined with the Magyars in demanding a constitution; and Servia and Bulgaria entered on a course of native reform, establishing schools and printing-presses, rallying round their Church autonomy, and echoing Prince Michael's words that 'a strong and free Slavonic state would be the best rampart of the Ottoman Empire.' Except for Russian propagandism, the Panslavic movement would thenceforth have gradually dropped out of sight. But by sowing broadcast such pamphlets as the *Epistle to the Serbians* (1860), and holding out inducements to young Slavonians to study at their universities, the Russian Panslavists carried on a silent campaign in Turkey, which culminated in the Moscow Ethnographical Exhibition of 1867. The second Panslavic Congress then held proved a greater fiasco than the first.

The Bohemians commented strongly on the absence of Polish representatives, and Palacky denounced as a chimæra the conception of a common (Russian) tongue; Russian P., he said, was sheer Panrussism. Words of brotherly amity failing, Russia next resorted to a different line of argument—the argument of necessity. The phrases 'historical destiny' and 'inevitable choice between becoming Germans or Russians' acted powerfully on minds familiarised with *kismet*, and did much to kindle the insurrection of the Herzegovina (1875). Just before its outbreak Panslavist committees had been established in Moscow and every Southern Russian town of any size, which furnished funds and arms, and played an intermediary part between the insurgents and the Imperialist Government of St. Petersburg. The members of these committees were almost to a man advanced revolutionists, whose object was neither the destruction of the Ottoman Empire nor the deliverance of suffering fellow-Christians, but the overthrow of absolutism at home by involving Russia in an exhausting war. 'If Russia were to conquer,' was their language at the commencement of the war, 'it would be our greatest misfortune, for it would apparently prove to the people that the government had been good, and that nothing required to be changed.' Towards the close of 1875 the committees kindled anew the insurrection at a time when it

seemed dying out; in 1876 their agents, Jonin, the consul-general at Ragusa, Wasselitsky, director of the Cetinje hospital, and Colonel Monteverde, afterwards sub-chief of Tcherniaieff's staff, were busy enrolling volunteers in Servian and Montenegrin corps; a year later the Imperialist government stepped in, to enter on a war which Russian Panslavists had foreseen from the first, and which they counted on—rightly or wrongly time alone will show—as a means to the attainment of their end. See E. L. Mijatovics, *History of Modern Servia* (Lond. 1872), and P., *its Rise and Decline*, in the *Fortnightly* (July 1873); D. M. Wallace, *Russia* (2 vols. Lond. 1877); and *Panslavists and the Slav Committees* in *Macmillan* (November 1877).

Pan'sy. See VIOLET.

Pan'tagraph (Gr. *pan*, 'all' and *graphō*, 'I write' is a kind of link-work by which a plan may be copied, reduced, or enlarged. It consists of a jointed rhombus ABCD, of which the sides AB and AD are prolonged to double their length to the points O and R respectively. If a line OPQ be drawn, cutting CD and DR in P and Q respectively, then evidently by similar triangles $OQ : PQ = AQ : DQ = AO : DP$. Hence if the points P and Q be taken so as to satisfy the one condition that O, P, and Q are in the same straight line, the ratio $OP : OQ$ is the same for every possible distortion of the frame, and hence if O be fixed, the two points will trace out exactly similar paths, but differing in dimensions according to the above ratio. For use the links CD and DR must be graduated and the pairs of corresponding points marked, so that the sliding boxes with the attached pencils or tracers may be adjusted in any required position.

Pantagraph.

Pantelleria, a volcanic island of Italy, in the Mediterranean, 47 miles from Cape Bon and 80 from Trapani. It is 30 miles in circuit, produces wine, olives, cotton, and capers, and is noted for its donkeys and mineral springs. The town of Oppidolo, with its old castle, lies on the N.W. side. P., the ancient *Cosyra*, was a place of banishment under the Roman emperors. Pop. (1874) 7000.

Pan'thays are the Mohammedan inhabitants of Yunnan in S.W. China. This is the name given to them by the Burmese; by the Chinese they are called Auayz, but they call themselves merely Muslim. Their country is cut off by wide mountain ranges both from the sea and from any co-religionists, and their origin is a mystery. The most plausible conjecture, embodied in their own traditions, is that they are the deported descendants of an Arab force that once came to help a Chinese emperor. They are fair, tall, and strongly built, and in dress approximate to the Chinese; but they scrupulously preserve their own religious usages. In 1855, suffering under the exactions of the governor, and perhaps stimulated by the success of the Taepings in E. China, they rose in rebellion; and being assisted by the hill tribes, established an independent state. They cordially received a British expedition to promote trade in 1868; but in 1871 the Chinese imperialists, who had never ceased the struggle, took their capital Tali Fu, the Sultan committed suicide, and the Panthay rebellion was at an end. The country has recently been traversed by Lieut. Gill, R.E., who left Shanghai in February and reached British Burmah in November 1877. See Dr. Anderson's *Mandalay and Momien* (Lond. 1876).

Pan'theism, as a name was first given by Fay in his answer (1709) to Toland's *Socinianism Truly Stated* . . . by a *Pantheist to an Orthodox Friend* (1705). The popular and etymological definition of the word would be that system of religion which identifies God with the universe, or according to which 'the all is God' (Gr. *to pan theos esti*) or 'God is the All.' But, as has been said, 'the word P. is the most indefinite of all indefinite words.' The actual meaning of the name depends on what is meant by the All, and what by God. Hence all so-called P. has lain between the two extremes of Materialistic P., according to which God is simply the gross material universe, and Spiritual or Idealistic P., according to which there is no material universe, what we call matter being merely an appearance, the image or shadow of the Infinite Being. It is this latter form of P. which is generally understood to be intended when the epithet Pan-

theist is applied to any one in modern times. Between these two extremes there is an intermediate form, which ascribes to the Infinite and Universal Being the attributes of both mind and matter, namely, thought and extension. P. has been the most widespread form of human thought regarding the origin and nature of the universe, undelimited, as it has done, almost all the forms of religion which have ever existed in the world. Fetishism (q. v.), the lowest form of religion, rests on the assumption that Nature is Divine. But the earliest known origin of P. proper was in India, where it was taught that the Eternal Infinite Being creates by self-evolution, whereby he becomes and is all existence. In the Rig-Veda (q. v.) Brahm ('He that is') is all things; all material forms are simply the forms of Brahm. The other great religious systems of antiquity—the Persian, Egyptian, and Greek—were also Pantheistic. All had their foundation in the doctrine of Emanation. The deities of the later Polytheism, personifications of the powers of Nature, were emanations from one infinite, inconceivable, nameless Being (Brahm; Zernane Akerne, which is not a name but means beginningless time; Ammon, 'the hidden One'; Zeus, 'the sky,' the unknown God) dwelling in the Light, as with the Persians, or in the Darkness, as with the Egyptians, who represented Nature in its infinitude, in which all things are contained, and of which all living things are the offspring. The fundamental principle of the different forms of Greek philosophy, Ionic, Eleatic, and Stoic, which all endeavoured to discover some one principle—material, spiritual, or double, that is active and passive, or material and spiritual—to which all modes of manifestation of being could be referred, was Pantheistic, in a material, spiritual, or hylozoistic form. With Plato God was an Idea which comprehended all other ideas, the universal intelligence which became individualised in the different orders of intelligent beings, gods, demons, and men. Of Neo-Platonism, according to which the soul of man was a mode of God's existence, and the universe the effluence of God, there were three phases: one allied to the Pagan philosophy; another to Judaism, as in Philo-Judæus (q. v.); and a third to Christianity, as in some even of the Christian Fathers, e.g., Origen (q. v.), Clement Alexandrinus (q. v.), and Dionysius the Areopagite (q. v.). The influence of Greek and Oriental philosophy was still more apparent in the heresies of Manichæism and the different forms of Gnosticism; but the most pronounced P. in connection with the Christian Church appeared in the *De Divisione Nature* of Erigena (q. v.), whose four divisions were reducible to two—God, from whom all emanates, and the things which emanate from him; and these again to one—the identity of God and creation. During the Middle Ages, notwithstanding the exertions of the Church, the prevailing philosophy was Pantheistic. The doctrines of Erigena and the Averroism (see AVERROES) of Amalric de Bena and Giordano Bruno (q. v.) were not only professed by popular mystic sects, e.g., the Beghards, Albigenses, and Brethren of the Free Spirit, but prevailed inside the Church, e.g., among the Franciscans (q. v.), especially the Fraticelli (q. v.), and even the Schoolmen, according to whom the fundamental idea of the co-operation of Grace is the Pantheistic notion of a participation of Deity. The father of modern P. was Spinoza (q. v.), although his doctrines were purely those of his master Descartes (q. v.), the founder of modern ideal philosophy, who shrank from following his own principles to their legitimate conclusion. Descartes defined God as an infinitely perfect, uncreated, and necessarily existing Being; alongside of whom was the Universe, an infinite substance. Spinoza could find room only for one Infinity, and held that the created was merely modes of the uncreated, that the spiritual and the material were originally one. In the modern transcendental philosophy of Germany the forms of thought originated by Kant (q. v.) were developed into P. by Fichte (q. v.), Schelling (q. v.), and Hegel (q. v.). See Hunt's *Essay on P.* (Lond. 1866).

Pan'theon, a Roman temple built by Marcus Agrippa in his third consulate, 27 B.C., stands near the centre of the Campus Martius. It is in excellent preservation, and consists of two parts, the temple proper and the portico. The former is a circular building of fine brickwork 140 feet in diameter and height, rising into a dome which is the finest in the world, and which has universally served as a model in modern architecture. The interior is lighted by a circular aperture 40 feet wide in the centre of the dome, and contains eight splendid monolith

columns, 32 feet high, of *giallo antico* marble. The portico, 100 feet wide and 40 feet high, is supported by 16 columns of Corinthian granite 13 feet in circumference, and 39 feet in height, and the frieze contains the inscription of Agrippa. The name P. may either have been derived from the fact that the building contained at one time the shrines of several deities, or from the unique appearance of its vast unsupported ceiling causing it to be likened to the vault of the heavens, the residence of the gods. In 609 it was consecrated by Pope Boniface IV. as a Christian church under the name of *Sa. Maria ad Martyres*, in commemoration of which event the festival of All Saints was instituted. The modern name of the church is *Sa. Maria Rotonda*. Within its walls lie the remains of Raphael and other famous men. In January 1878 it received the remains of Victor Emmanuel, the first King of United Italy.

Pan'ther, the name of a carnivorous quadruped of the family *Felidae*, scientifically named *Felis pardalis*. By many zoologists the P. is regarded as the immature form of the Leopard (q. v.); some maintain that it is only a variety of that animal; while others consider it a totally distinct species. It is a native of the southern parts of the Old World. Its colour is a tawny yellow, and the spots consist of circles of smaller spots. The average length of the P. is six to seven feet.

Pan'tomime (Lat. *pantomimus*, from the Greek), a dramatic performance in which gesture takes the place of dialogue. Imitative acting of this kind has been common among the Chinese, the Persians, and other Oriental nations for many centuries. The Romans patronised with keen appreciation representations of dance and gesture only, the performers in which were called *pantomimi*, and similar entertainments spread from Italy at a very early period over all Europe. At the present day in some Continental opera-houses—as in that of Vienna—an entire night's entertainment composed solely of ballet, with pantomimic action, is frequently given. The word P. has now, however, a special signification as applied to the Christmas entertainments at our theatres so popular with young people. Almost every theatre in London a few years ago produced a pantomime on boxing night, but many of the smaller houses, unable from want of stage accommodation and resources to compete with their more spacious rivals, have discontinued the practice. In the national and historic theatres of Drury Lane and Covent Garden, we have still, however, all the dazzling glitter and fairy magnificence of yore. The legitimate drama is suspended that the heroes and heroines of the nursery, the princes and princesses of fairy-lore, and the genii and demons of superstitious childhood, may strut the boards, marshal gay processions of richly-attired knights and ladies, and survey the butterfly splendour of a hundred tripping nymphs. Thousands of pounds are spent, and hundreds of performers engaged, that the lavish glory of the spectacle may be complete. The Crystal Palace and Surrey Theatre pantomimes have well-established reputations, while those of Edinburgh, Liverpool, Glasgow, Manchester, Dublin, &c., are scarcely inferior. At the Adelphi Theatre in 1876 the experiment of a P. acted by children alone was tried for the first time with marked success. The P. proper, or 'harlequinade,' is the coarsely comic after-piece which follows the transformation scene of the extravaganza, in which the principal performers are the clown, a hilarious and athletic rascal, and the pantaloons, his hoary brother reprobate, who indulge in racy practical joking and wild horse-play, while harlequin with magic wand and the graceful columbine relieve the picture by illustrations of the poetry of motion. 'Sprites,' acrobatic performers, frequently appear also in the harlequinade. This sort of entertainment is said to have been first introduced into the country in 1702 by a dancing-master of the name of Weaver. The famous clown Grimaldi was the populariser of the harlequinade, which underwent many modifications in his hands.

Pantop'oda, a division of *Arachnida* (q. v.), represented by the 'sea-spiders' belonging to the genus *Pycnogonum*, of which *P. littorale* is a familiar species. These animals are notable from the fact that the digestive system extends into the legs, of which there are four pairs. The abdomen is rudimentary, and there are no specialised breathing-organs. The sexes are distinct. The order P. is sometimes also known under the name *Podosomata*.

• **Pa'oli, Pasquale di**, a patriotic Corsican leader, born in 1726 at Rostino, in the Island of Corsica, was brought up at Naples, whither his father, Giacinto de P., had retired on the failure of his attempt to free his country. In 1755 P. was elected Commander-General of Corsica and head of an independent democracy, a position he held for twelve years, effecting many useful reforms, and accomplishing the expulsion of the Genoese. But the island having been ceded to France in 1768, he was completely defeated by the French troops under the Comte de Vaux, and forced to seek refuge in England. On the outbreak of the French Revolution in 1789 he was recalled to Corsica, where he founded a republic and allied himself to the British, with whose aid he succeeded in driving out the French. He then gave up the island to the English—a step which aroused the displeasure of his countrymen, whereupon P. returned in 1796 to London, where he died, 5th February 1807. See Boswell's *Account of Corsica* (Glasg. 1768); *Lives of P.* by Arrighi (Par. 1843); Klose (Brunswick, 1853); and Bartoli (Ajaccio, 1867).

Pap'a, a town in Hungary, on the Tapolca, 25 miles S.W. of Raab by rail, has a stately castle; and fine Roman Catholic Church, a Greek church, and a Reformed College, and manufactures cloth, pipes, and stoneware. Pop. (1869) 14,223.

Pap'acy. See POPES.

Pap'al States, formerly comprised that part of Italy of which the Pope was the temporal sovereign. The extent of the territory varied at different times, but in 1859 the area was 15,774 sq. miles, and the pop. over 3,000,000. It stretched from Naples in the S. to the Po in the N., and was rather irregular in shape, the northern half lying for the most part E. and the southern half W. of the Apennines. The P. S. originated in the gift of Pippin the Short to Pope Stephen II., but it was not till the 11th c. that the temporal sovereignty of the Popes became a reality. Their alliance with the Norman conquerors of Naples, and the devotion of the Countess of Tuscany to the Papal See, resulted in a large extension of their authority N. and S. But it was not till the 16th and 17th centuries that the popes began to play a thoroughly secular part in Italian politics. Alexander VI., Julius II., Leo X., Gregory XIII., are among the most notable of the pontiffs to whom the enlargement of the P. S. is due. Napoleon Bonaparte incorporated the States with France, but the Congress of Vienna (1814) restored the papal authority. In 1859 the Romagna proclaimed its annexation to Sardinia; in the year following Garibaldi's victories in Sicily and Naples led to the revolt of Urbino and the Marches, which were also annexed to Sardinia, and finally, in October 1870, on the withdrawal of the French troops, Rome passed into the possession of Victor Emmanuel, and the temporal power of the Papacy came to an end.

• **Papavera'ceæ** is a natural order of dicotyledonous herbs, usually with milky or coloured juice. The leaves are alternate, without stipules; the flowers are generally showy and on long stalks, with two or three deciduous sepals, and four or six petals crumpled in bud; the stamens are numerous; the fruit is long, siliqueiform, one-celled, or capsular and many-celled, opening by pores at the apex; the seeds are many and small, the albumen, oily and fleshy. The P. abounds in Europe, extending sparingly eastward into N. Asia and Japan. Some are found in tropical America, but they are scarce in the southern hemisphere. The family possesses well-marked narcotic properties, and some are emetic, purgative, or acridly poisonous. The principal genus is *Papaver*, or the Poppy (q. v.). See CELANDINE, and SANGUINARIA. Representatives of *Eschscholzia* are common in gardens.

Papaw', named by botanists *Carica Papaya*, belongs to the natural order *Papayaceæ* (by some systematists reduced to a tribe of *Pussifloraceæ*). It is a soft-wooded, fast-growing, short-lived tree, about 20 feet in height, thick and gouty at the base, and bearing a crown of large glabrous palmate leaves on long stalks. The succulent fruit is of a dingy orange-yellow, generally oblong in shape, containing numerous black, wrinkled seeds, embedded in a soft mucous pulp. It is indigenous in Brazil, and probably also in Central America and the W. Indies, but is now cultivated in many tropical countries, and must have been early introduced into India. The fruit, for which it is chiefly valued, is eaten in an unripe state as a vegetable, and is likewise made into a pre-

serve; when ripe it is very sweet and pleasant. The seeds are pungent. A peculiarity of the P. is that meat washed in water impregnated with its milky juice becomes tender, and the same result is obtained by suspending the joint amongst the leaves of the tree. In *C. spinosa*, the Chambern of Guiana and Brazil, the juice is exceedingly acrid, causing blisters if it comes in contact with the skin. The fruit is not eaten, and the flowers have a disgusting carrion-like odour. The fruits of other species, e.g., *C. citrifolmis* and *C. pyriformis*, are eatable, but are insipid. N. American P. is *Asimina triloba*, belonging to *Anonaceæ*. It yields a fragrant, fleshy, edible fruit.

Pap'enburg, a town of Prussia, province of Hannover, 27 miles S.S.E. of Emden, with which it is connected by rail and canal. It has a navigation school, and a trade in grain, peat, and timber, and manufactures sailcloth and cordage. Pop. (1875) 6819.

Pap'per (Fr. *papier*, from Lat. *papyrus*), a term derived from the material principally employed (see PAPHYRUS) by the cultured nations of antiquity for writing purposes. The use of papyrus declined and altogether ceased with the decay of the Roman Empire and the gathering gloom of the dark ages, and when reviving learning gave rise to a renewed necessity for writing materials, P. had become a substance recognised among European nations. The origin and early history of P. appears to be lost in insurmountable obscurity, but all circumstances point to China as being the country where the art of P.-making was first practised, and from which a knowledge of the material was first obtained. It is certain that the industry was established in China several hundred years before the Christian era, and at that remote period P. was an article of much importance among the Chinese. The principal source of Chinese P. to the present day is the inner bark of the P. mulberry tree, *Broussonetia papyrifera*—the material which forms the principal part of the tapa or bark cloth of the South Sea Islands, and doubtless the facility with which this material may be pulped in water, and the readiness with which the pulp mats or felts on drying would be observed by the Chinese, and thus lead naturally to the preparation of P. Although the P. mulberry bark thus furnished the first P., the Chinese were not long in discovering that many other fibrous materials could be used for P.-making, and at an early period they utilised other closely allied bast fibres, cotton, bamboo-shoots, and straw; and at a later period they introduced cotton and linen rags. While thus the Chinese attained great experience in the art, western communities learned only slowly to make and use P. About the 11th c. the Arabs prepared P. from raw cotton, which for a period of nearly three centuries was the only quality of P. known in Europe; and so bad was it that in 1221 the Emperor Frederick II. ordered all imperial proclamations written upon P. to be transcribed on parchment within two years. P.-making appears first to have been practised in Spain early in the 14th c., and in 1390 a mill was established at Nürnberg, where it was discovered that linen and hemp were, equally with cotton, available for the manufacture, and moreover that the P. made from these fibres was much stronger and more durable than cotton P. The earliest notice of P. being made in England occurs in a work printed by Caxton about 1490, where, in allusion to P. made by John Tate, it is said:—

'Which late hathe in Englonde doo make thya paper thynne,
That now in our Englyesh thya booke is printed inne.'

In the household book of Henry VII. two sums are noted as being given to Tate, one in 1498 and the other in 1499, as an encouragement for the working of his mill, which was situated at Stevenage in Herts. The art, however, did not make very rapid progress in England, and it was not till well in the 18th c. that the industry and perseverance of James Whatman raised P.-making in Great Britain to such a degree of perfection that it could compete successfully with the best products of Continental manufacturers.

P. may be regarded as a species of felt of fibrous material prepared by disintegrating the fibres to their smallest practicable size, making them into a thin uniform pulp, spreading the pulp out into thin layers, draining, drying, and pressing it. Both animal and vegetable fibres can be made into P., but except in the case of blotting P. and similar bibulous qualities, which are principally made from woollen rags, vegetable fibres are chiefly employed. Some of the materials from which P. was made in early times have been already alluded to; but as the

demand for the material has in modern times grown in an unparalleled manner, the substances which have been proposed for P.-making, and used with more or less success, are very numerous. The materials which most conveniently adapt themselves for P.-making happen to be those which are serviceable in textile industries, and as the rags and refuse of textile fibres are as well suited for P.-making as the raw fibres, it was only to rags that the manufacturers looked for their raw materials so long as the supply was equal to the demand. Thus, of course, the fact that fibres could be first used for clothing and like purposes, and afterwards devoted to P.-making prevented the profitable cultivation of these fibres for the direct and immediate use of P.-makers. But as the supply of rags became insufficient, other sources of P.-making materials had to be sought; and although the coarser qualities of P. presented no difficulty, it became a serious question how to maintain the supply of qualities of P. fit for printing and writing purposes. The desirability of obtaining new and additional sources of P. was indicated by the fact that so early as 1765-71 J. C. Schaeffer published a work, *Sämmtliche Papierversuche*, in six parts, in which no less than 81 specimens of P. prepared from different materials are incorporated. Among all the substances which have been proposed, and which are practically useful for supplementing the supply of cotton and linen rags in the fabrication of P., only a few have come into extended use in Europe, and of these the chief are esparto, diss, straw, and bamboo, all belonging to the order *Graminacea* or grasses, and various kinds of white wood. Of substances more rarely used or employed only by Oriental P.-makers there may be mentioned the leaves of the dwarf palm (*Chamærops humilis*), and of some other palms; the reeds of *Arundinaria macrospora*, employed in America by the American Fibre Disintegrating Co.; sugar-cane refuse or megass, used in the West Indies; the bast of *Broussonetia papyrifera* and other species of *Broussonetia*, *Edgeworthia papyrifera*, *Tassarina gaudieri*, which, with two or three other fibres, yield the bulk of the P. made in China and Japan; bast of the baobab (*Adansonia digitata*); jute cuttings and 'butts,' being the ends of jute fibre; nettle stalks, used in Hungary; reha fibre (*Boehmeria tenacissima*), China grass (*B. nivea*), and gombo bast (*Abelmoschus esculentris*), used in Paris. Potato stalks and hop bine have also been occasionally employed.

Rags, which yet form the staple and most desirable material for P.-making, are classified for the purposes of the manufacturer into 'fines,' 'seconds,' and 'thirds,' the latter class containing rough cotton fabrics, such as fustians, &c., and 'stamps' or 'prints,' principally printed and dyed calico rags. The expense connected with the preparation of straw pulp greatly limits the use of that material, but it is employed for common wrapping papers, and added to rag and esparto pulp for the cheaper kinds of P. Esparto, which is now a most important material, is the product of two species of *Macrochloa*, the one (*M. tenacissima*) found on the Mediterranean coast of Spain, and the other (*M. arenaria*) on the opposite African coast. P. from esparto leaves was shown in the Great Exhibition of 1851, but it was not till ten years later that, through the exertions of Mr. T. Routledge, it came into prominent notice, and the import into England rose from 8000 tons in 1861 to 174,720 tons in 1877. Esparto is easily pulped, and yields a large percentage of ligneous fibre. Diss (*Ampelodesmos tenax*) is an allied grass obtained from the N. African coast. The value of bamboo as a P. material has been recently insisted on by Mr. Routledge. It is from the young green stalks of the bamboo, freed from their green epidermis, that the 'India P.' used for taking the delicate impressions from engravings called 'India proofs,' is prepared. In connection with the use of wood in P.-making no less than 120 patents have been taken out in England during the present century. The soft white and non-resinous woods are most suitable for manufacturing; and in America, where the preparation of wood pulp has attained great importance, the wood of the tulip tree or American poplar (*Liriodendron tulipiferum*) is principally used, but the lime, poplar, aspen, willows, &c., also form suitable woods. P. manufacture involves two distinct sets of operations—(1) the preparation of the pulp, and (2) making of the P. from pulp.

Pulping of Rags.—The rags are first carefully gone over by women; seams are opened out, buttons, pins, &c., removed, and on a fixed knife the assorted qualities are cut up into small pieces. They are then placed in a 'dusting' machine, and as

far as possible cleaned by passing a powerful fan-blast through them. Thus prepared they are placed in a revolving cylinder boiler, and boiled for several hours with caustic soda under pressure, after which they are ready for maceration. The machine used for this purpose is termed an engine or 'Hollander,' being a Dutch invention of last century. It consists essentially of a large strong cast-iron cistern AA, seen in plan and section in accompanying figures. The cistern is divided in the

centre by a partition BB. On one side of this partition there is a cylinder C studded with knife-edges, and which is set in rotation by an axle bearing on the two sides and the partition of the cistern. Under the cylinder is an iron breast and back fall D, sloping gently up at the intake side, and in it, directly under the cylinder, is studded a set of knife-edges E, against which the cylinder draws the material when it is in motion. A

cover F is placed over the cylinder when it is in operation, as otherwise, by the rapidity of its revolutions, the rags would be thrown quite out of the cistern. The direction in which the cylinder revolves is indicated by arrows, and the rags mixed with clean water circulate round and round in the direction also shown by arrows. The material passes through this apparatus with suitable modifications three separate times before it is completely prepared. In the first—the washing engine—while the rags are circulating and being torn or broken in, clean water is being constantly run in, and dirty water is drained away through fine gauze. The contents of the washing engine are next passed into the potcher or engine for bleaching, which is effected by a solution of chloride of lime. Rag pulp is passed into stone cisterns, where it lies in the solution for a day, and is subsequently drained and pressed to free it from the chlorine. Esparto and other pulps are pressed direct from the potcher. All remaining traces of chlorine are removed by washing or by antichlor (hyposulphate of soda) in the second or intermediate engine, where it is torn up to the condition of 'half stuff.' The half stuff is subsequently drained into the third beating engine at a lower level, where it is finished into a smooth uniform pulp with great rapidity, the cylinder of the machine revolving at the rate of from 100 to 150 revolutions per minute. The size in the case of printing paper is introduced into the beating engine before the pulp is finished, and if the paper is to be blue or any way tinted the colouring matter is also at this stage added. The size for printing P. consists of pounded alum and resin, and the blue is artificial ultramarine or smalts. In the successful preparation of pulp the quality of the water used has much influence; hence P.-mills are all centred on streams yielding a copious supply of pure water.

Hand-made P.—Till the early part of the present century all P. was made by the process here alluded to; but now it is employed for only a very small fraction of the total supply, principally for such special purposes as bank-notes, deeds, and records, account books, architectural and other drawings, &c. The prepared pulp is placed in a large vat, in which it is kept in continual agitation sufficient to prevent any precipitation. The sheets of P. are made by means of the 'mould' and the 'deckle.' The mould is a square hard-wood frame covered with wire-cloth, and made slightly larger than the sheet of P. for which it is used. The deckle is a thin frame held by the workman on the top of the mould, and enclosing and holding a sufficient quantity of pulp to make a sheet of the required thickness. Mould and deckle, thus forming a kind of shallow sieve, are dipped into the pulp vat, and drawn out in a horizontal position. The superfluous pulp flows over the edge of the deckle, and immediately the water begins to drain away through the wire cloth of the mould. The apparatus is moved about in a dexterous manner, so as to produce a regular distribution of pulp and a sheet of uniform thickness. The deckle is removed, the mould placed in a sloping position for a little, and the sheet, which has now some amount of cohesion, is placed on a piece of felt, which imbibes further moisture from the sheet. A pile of sheets and felts, equal to six quires of P., are thus made up, and put into a powerful press, where by squeezing still more moisture is expelled, and at the same time the surface of the P. is somewhat smoothed and levelled. Subsequently the sheets are separated from the felts, and piled together in another press by themselves, where they are still further dried and smoothed. They are next hung separately in a loft to dry, from which they are taken to be sized. The size is prepared from shreds and parings of parchment, and to the thin solution of size a little alum is added. Into this the sheets are dipped, the superfluous size is squeezed out and run back into the vat, and the sheets are again hung up to dry. Finally, they are examined, imperfect sheets are removed, they are piled and squeezed in a hydrostatic press, made up into quires and reams, and so ready for the stationer. The water mark and the makers' names seen in many papers are produced by bending wires to the form of the required device or letters, and attaching them to the surface of the wire cloth of the mould or machine. 'Laid' P., in which close placed parallel lines are observed crossed or barred with single lines wide apart, is made on a wire cloth consisting of close-set parallel wires held together by cross wires set at regular intervals, to which they are bound by fine wire. In 'wove' P. no such markings are seen, as the wire cloth used for it is ordinary woven wirework. These water marks are seen on account of the P. being thinner at those points where there is any elevation on the surface of the wire cloth.

Machine-made P.—While the size of hand-made P. is limited by the size of the moulds and deckles which workmen are able to support and move, machine-made P. may be altogether unlimited in length, because it is made in a continuous sheet, while its breadth is only limited by the breadth of the machine on which it is made. The one result of obtaining a continuous web of P. is an improvement of enormous importance when the necessity for considerable lengths in P. hangings, &c., is considered, and more especially when it is borne in mind that now all important daily journals are printed on 'web machines' (see PRINTING). The advantages in point of saving time and material are however even more considerable, while in uniformity of texture the machine-made P. is an improvement on that made by hand. The credit of originating the most beautiful and important machine now used for P.-making, is due to M. Louis Robert, a clerk in a P. mill at Essonne, in France, which belonged to M. Leger Didot. The machine was patented in France by M. Robert in 1799, and in 1801 M. Didot brought the invention to England, where a patent was secured and assigned to Messrs. Fourdrinier, who with great and long continued labour and at an expense ruinous to themselves succeeded in making the machine a practical success. Many improvements have since the early part of the century been wrought on the Fourdriniers' machine, which is now one of the most perfect pieces of machinery in operation in the whole range of the industrial arts.

Without attempting any minute description of the P. machine it will be sufficient to indicate what it actually does. The pulp passes from the vat in which it is kept in motion by a cock into

a trough in which is a mechanism for freeing it from knots. From the trough it flows out in a regular even stream over a leather apron, till it falls on the wire cloth 'form,' which in the machine is an endless band passing over and under a series of copper rollers of small diameter. The wire cloth as it progresses has a vibrating motion communicated to it whereby the draining of the pulp is facilitated, and the edges of the sheet are bounded by 'deckle' straps of indiarubber which press against the upper surface of the wire cloth. The draining of the pulp, while it travels over the wire cloth, is still further hastened by a partial exhaustion of the air under the wire cloth by means of air pumps or fan blast. After passing over the suction apparatus the pulp passes under a wire cylinder called a 'dandy roll,' which gives it the character of 'wove' or 'laid,' and being now somewhat compacted, it passes between a pair of heavy felted rolls called 'couchers,' after which it leaves the wire cloth form, and passes on to an endless felt, on which it is carried forward till it is successively caught and squeezed between two pairs of rollers. The P. has now sufficient consistency to adhere without further support, and leaving the felt it passes over the surface of a series of drying cylinders heated internally by steam, from which it is wound upon a reel as finished web P. Writing papers undergo a subsequent process of sizing and glazing in a long drying chamber before they are ready for cutting into sheets of the different sizes used, but in the case of printing P. the requisite size is put into the pulp, and no further process is necessary except cutting into sheets where the P. is not used in the web.

The machine-making of P. has to a great extent rendered obsolete the old distinctions of sizes in P. which prevailed when only the hand moulds were used. Of hand-made writing and drawing papers the largest size made—called antiquarian—is $52\frac{1}{2} \times 30\frac{1}{2}$ inches, and through numerous sizes, including double elephant, $39\frac{1}{2} \times 26\frac{1}{2}$; atlas, 33×26 ; elephant, 28×23 ; imperial, $29\frac{1}{2} \times 21\frac{1}{2}$; royal, $23\frac{1}{2} \times 19$; post, $19\frac{1}{2} \times 15\frac{1}{2}$; copy, 20×16 ; foolscap, $16\frac{1}{2} \times 13\frac{1}{2}$; it passed to the smallest—pott— $15\frac{1}{2} \times 12\frac{1}{2}$. Even in the case of hand-made P. these sizes varied, and in addition to many other sizes and designations, printing papers and wrapping papers had each for themselves a distinct set of sizes and names. Machines for cutting the webs of machine-made P. accurately to any size are in use, and names and water marks are introduced on the endless wire-cloth forms, so that each sheet of the P. when cut will show the names and devices at the same place.

Mill-board (q. v.) is simply a coarse P. made either by hand or in a modified form of machines having a huge drum around which successive layers of soft pulp are wound till the requisite thickness is attained. Pastelboard consists of a central layer of coarse P. on each side of which a thin sheet of fine P. is pasted. The finer boards, such as Bristol board, London board, &c., consist of sheets of P. pasted together, the sheets used varying in number according to the desired thickness of board. The varieties of P., as must be obvious to the most superficial observation, are almost numberless, but they may be all classified under such heads as writing, printing, wrapping or packing, fancy papers, and 'boards.'

Kudel's tables for 1873 gave the number of mills in the world as 2309, of machines 2042, and the product as 1,198,000 tons. According to Lockwood's tables for 1872 the United States had 812 P. mills (value \$35,500,000), 299 Fourdriniers' machines, 690 cylinder machines, 3296 engines, employing 13,427 men, 7700 women, and 922 children; yearly produce 317,637 tons (value \$66,500,000). Mr. W. Arnot, F.C.S., Edinburgh, in a lecture on the manufacture of P. at the rooms of the Society of Arts, London (January 1878), stated that the number of mills in Great Britain was 385, of which 65 were in Scotland. The mills had 526 machines at work, producing annually 350,000 tons of P., to which should be added 10,000 tons made by hand, the value of which amounted to £20,000,000. With respect to the consumption of P. in different countries Mr. Arnot stated that in Russia the annual consumption was 1 lb. per head of the population, in Spain $1\frac{1}{2}$, Mexico and Central America 2, Italy and Austria 5, France 7, Germany 8, United States $10\frac{1}{2}$, and Britain $11\frac{1}{2}$.

Paper Days, in English law, are certain days in each term, so called because on them the court hears the demurrers (see DEMURRER) or issues at law which have been entered in the Paper Book (q. v.) for argument, before they enter upon motions.

Paper Hangings are a modern substitute for the costly tapestries, figured silks and velvets, &c., formerly used in decorating the interior walls of dwelling-houses. P. H. have been in use in China from time immemorial, and large quantities were imported into Britain towards the close of the 17th c., at which time the home manufacture was first established. In 1634 Jerome Langer patented a process of producing cheap substitutes for tapestries by affixing with oil-size dyed wool in powder called *flock* to linen and cotton grounds. He does not seem to have used paper, but later in the same century flock P. II. began to be manufactured, and afterwards block-printed and stencilled P. II. were introduced. The growth of the new industry was for a century and a half greatly impeded by a heavy impost, and consequently P. II. were then only found in the homes of the wealthy. In 1836 the duty on P. II. was repealed, with the happy result of greatly advancing the manufacture. The invention of the paper-making machine, too, gave a great impetus to the art by providing endless sheets of paper in place of the small separate sheets previously available. P. II., as now manufactured, are of two kinds, *hand* or *block* and *machine-printed*. In block-printing the paper first receives a uniform coat of colour to form the ground, and the pattern is produced by many operations with figured wooden blocks, supplied with colour or size. The blocks, which measure 21 inches in breadth and vary in length according to the pattern, bear particular portions of the complete design, either carved in relief for printing a surface pattern, or formed with strips of brass fixed edgewise and bent into ornamental contours for an outline pattern. The blocks also carry 'guide lines' and pins to guide the printer in laying them on the paper. The peculiar glossy grounds of *satin* papers are produced by coating with Paris white and then polishing with brushes and powdered French chalk. *Flock* P. II. have dyed wool in powder sprinkled over a kind of size, and *gold* P. II. take their name from a similar application of gold or Dutch metal in leaf or powder. The brilliant effects of *stamped gold* P. II. are obtained by impressing heated metal dies on the gold leaf, and *embossed* P. II. are finished by being passed between an engraved brass cylinder and a paper roller, markings in imitation of leather being produced in this way. Machine-printed P. II. are inferior in many respects to block-papers, but their sale is enormously greater on account of their cheapness. The tinted paper is rapidly passed in the continuous web through a machine resembling a calico-printing machine, and leaves it with the design complete, and also marked off into 12-yard pieces, which are ready for the market after being rolled up by machinery. A two-colour pattern is printed at the hourly rate of 500 pieces, and 100 pieces of a twenty-colour pattern are thrown off in the same time. Each of the printing-rollers has that portion of the pattern belonging to one colour inlaid in brass outline, and for broad-surface printing the interspaces are filled with felt, which takes up the colour from the trough and parts with it when pressed against the paper. British P. H. have of late years been brought to a high state of perfection, and this is greatly due to the valuable services rendered to the art by Owen Jones and other celebrated designers. For artistic excellence French productions stand unrivalled.

Paper-Mulberry. See MULBERRY.

Paper-Nautilus. See ARGONAUT and NAUTILUS.

Paphlagonia, anciently the most northern province of Asia Minor, was bounded N. by the Black Sea, W. by Bithynia, S. by Galatia, and E. by Pontus. The country measured about 200 miles from E. to W., and about 100 from N. to S. The northern part consists of fruitful plains, but the S. is rugged with the spurs of Mount Olgassys. The only town of great importance was the capital Sinope, on the shore of the Euxine. The name P., which is very old, being mentioned by Homer (*Il.* ii. 851, &c.), is derived (according to legend) from Paphlagon, son of Phineus. The Paphlagonians were famed in antiquity as soldiers, and especially for their cavalry. P. was conquered by Croesus, along with the rest of whose possessions it passed to Persia. After a brief period of freedom, it fell into the hands of Mithridates. Under the Romans it was first ruled by tributary princes, but after the 1st c. A.D. it formed part of the province of Galatia.

Pap'phos (mod. *Baffo*), the name of two ancient cities situated in the S.W. of Cyprus: **Old P.** (*Palaipaphos*) on an eminence,

2 miles inland; and **New P.** (*Neapaphos*), on the seashore, 8 miles to the N.W. The former contained a famous temple of Aphrodite, who was fabled to have landed here when she sprang from the foam (*Hom. Od.* viii. 362); while at New P. St. Paul preached before Sergius Paulus, and struck the sorcerer Elymas with blindness.

Pap'ias, one of the Apostolic Fathers (q. v.), and Bishop of Hierapolis, a city of Phrygia, is said to have suffered martyrdom in the year 163 A. D. Irenæus, from whom, with Eusebius, all our information regarding him is derived, calls him a disciple of John (doubtless meaning the Apostle) and companion of Polycarp (q. v.). Eusebius, however, quotes his own words to show that it was not the Apostle, but John the Presbyter, who was the instructor of P. He wrote a Greek work in five books entitled *An Exposition of the Lord's Sayings*, of which only a few extracts are preserved by Eusebius, who informs us that the work was compiled from unwritten tradition, containing 'some strange parables and doctrines of the Lord, with other fabulous stories, which the authority of so venerable a person . . . imposed upon the Church for genuine.' P., like most Christians of his time, held the doctrine of a Millennium (q. v.), a belief which Eusebius explains in the case of P. by his interpreting literally and grossly what the Apostles had delivered in a typical or mystical sense. There is one important tradition recorded by P. regarding Matthew and Mark—namely, that the former 'wrote *The Sayings* in the Hebrew language,' and that the latter, having become the interpreter of Peter, 'wrote accurately what things he remembered.' See Donaldson's *Christian Lit. and Doct.* (Lond. 1864).

Papier-Mâché (Fr. 'mashed paper') is a material used for making small boxes, cabinets, trays, portfolio covers, ornaments on large gilt frames, and the architectural decoration of interior walls and roofs. It consists mostly of waste paper repulped and pressed in moulds to the required form; old wall posters, &c., are found to be very suitable for this purpose, owing to their coatings of paste. For the finer varieties of work, sheets of paper glued together are employed, these being damped and moulded in the same way as the pulped paper. When the moulded article is made, if not intended for an architectural ornament, it is varnished and decorated in various ways, the most common method being to coat it with successive coverings of Japan black, in which thin slices of mother-of-pearl are imbedded to form an ornamental design. When, by repeated coatings, the Japan black is level with the top of the inlaid pearl, the surface is smoothed and polished, and generally finished with colour or gold, and a coat of transparent varnish. The P.-M. trade is an important Birmingham industry, where imitations of the fine lacquer-work of Japan and China are largely produced. On account of its lightness, P.-M. is a material in considerable use for the ornaments of large gilt picture frames; the House of Lords and many other important public buildings are internally decorated with P.-M. gilt ornaments.

Papilio, a genus of Butterflies (q. v.), including many well-known forms, e.g., the swallow-tail (*P. Machaon*), *Sarpedon* (*P. Sarpedon*), *Hector* (*P. Hector*), &c. In this genus, which forms the type of a family (*Papilionidae*), the hinder wings have a prominent 'tail.' The larvæ vary in appearance and size.

Papilionaceæ is by far the largest of the three sub-orders of *Leguminosæ*, comprising about 300 genera and 5000 species. In it are included all those with papilionaceous or butterfly-like flowers. The flower of the pea is a good illustrative example. It consists of five petals, the upper one is exterior and is called the *standard* or *vexillum*, the two lateral ones are termed *alæ* or *wings*, and the two inferior, more or less cohering, form the *carina* or *keel*. The useful and beautiful plants included in P. are very numerous, and their medicinal properties very various. The principal ones are described under separate titles, e.g., Bean, Broom, Calabar Bean, Clova, Gum Tragacanth, Indigo, Kidney Bean, Kino, Laburnum, Liquorice, Lucerne, Melilot, Pea, Sandal-wood. The whole of the British leguminous plants, numbering 78 species, belong to this sub-order.

Papillæ, the name applied in anatomy to indicate any small or minute protuberances of the skin-surface. Those of the skin are good examples. They consist of processes of the *dermis* or true skin covered by the *epidermis*, and receiving the termina-

tions of the nerves, thus becoming adapted for exercising the functions of sensory organs. See SKIN, TOUCH, TASTE, &c.

Papin, Denis, a famous French physicist, was born at Blois, August 22, 1647. He studied medicine at Paris and practised for some time as a physician; but, encouraged by Huyghens, he ultimately turned his attention to physical science. The Edict of Nantes compelled him to leave his country, and after a considerable period spent in England, where he became intimate with Boyle and other English philosophers, he was offered in 1688 the chair of mathematics in the University of Marburg in Hessen-Kassel, which he accepted and held for many years. He died at Marburg in 1715. P. is best known for the invention of the *digestor* which goes by his name (see DIGESTER, PAPIIN'S). He made, further, many important discoveries in the action of heat, and was the first to construct a veritable steam engine. He also improved the air-pump, and demonstrated the alteration of the boiling point of a liquid under altered pressure. See I. a. Saussaye et Péang, *La Vie et les Ouvrages de D. P.* (Par. 1869).

Papinianus, Æmilianus, one of the most famous Roman jurists, was born about 140 A.D. He is said to have been related to Julia Domna, the second wife of the Emperor Severus, and this is supported by the many favours conferred upon him by that monarch, whom he succeeded as *Advocatus Fisci*, and under whose reign he was created successively *Libellorum Magister* and *Præfatus Prætorio*. It is probable that during the residence of Severus in Britain (208-211) P. also lived there; and it is said that the Emperor, before he died at York (211), commended his two sons Caracalla and Geta to his care. Caracalla, however, having in the second year of his reign murdered his brother, and no doubt considering that the strict integrity and great legal knowledge of P. must render the latter hostile to himself, caused him to be put to death (212). P., who has always been regarded both in character and intellect as a model jurist, wrote several important works, which were annotated by Paulus and Ulpian, and on which Cujacius composed elaborate commentaries. There are extant 595 extracts in the Digest (q. v.), from his seven books of *Quæstiones*, nineteen of *Responsa*, two of *Definitiones*, and two *De Adulteriis*.

Pappenheim, an old Swabian family, which took its name from the district of P., in Middle Franconia. In 1439 the family divided into four branches, Gräfenthal, Algöw, Treutling, and Alzheim. The first three are long since extinct, and of the fourth, the only representative, a Protestant, holds the estate of P. in Bavaria. For the loss of the office of Marshal of the Empire, since the 12th c. hereditary in the family, compensation was given at the Peace of Paris in 1815. In 1831 the head of the family received the title of 'Erlaucht' from the King of Bavaria.—**Gottfried Heinrich von F.**, born 29th May 1594, distinguished himself as an Imperial general of cavalry in the Thirty Years' War, not more by his extraordinary bravery than by his harshness and cruelty. His first great exploit was as a colonel in the battle of Prag in 1620. In 1623 he was placed by the Emperor at the head of a regiment of cuirassiers, which was afterwards generally known as 'the Pappenheimers.' He was made a field-marshal in 1629; from the summer of that year he lay before Magdeburg, remaining there after Wallenstein's deposition, under the command of Tilly. It was mainly through the exertions of P. that Tilly took that city (10th May 1631). After Tilly's defeat at Breitenfeld, P. accompanied him to Westphalia and Hessen, where with changing fortune he led the petty war against the Landgraf Wilhelm V. Failing in an attempt on Maastricht in 1632, he was recalled by Wallenstein to Thuringia. From Halle, whither Wallenstein had sent him, he turned (6th November 1632) with his cavalry to the battlefield of Lützen, too late to prevent defeat. Mortally wounded, he died the next day at Leipzig. See Hess, *Gottfried Heinrich Graf von P.* (Leips. 1855). His line died out with his son in 1647.

Pappus. In *Compositæ* the margin of the calyx develops after the withering of the flower, sometimes remaining membranaceous and entire (*coronate*), but is usually transformed into bristles or hairs called P. This may either be simple (*pilose*), or feathery (*plumose*), and either stalked (*stipitate*), or not stalked (*sessile*). Of pilose stipitate the dandelion is an example; of the pilose sessile, the groundsel; of plumose stipitate, the goat's beard; and of plumose sessile, the scorzonera. The chicory and

tansy have a coronate P. Instances occur also in the valerian and teasle orders. The advantage of P. is the ready dispersion of the seeds by the wind.

Pappus of Alexandria, one of the later Greek geometers, flourished, according to Suidas, under the reign of Theodosius the Great (A.D. 379-395). His chief work is his *Mathematical Collections*, which consisted originally of eight books, of which, however, the first and second have been lost. Wallis, it is true, in 1688 published a *part* of the second book at the end of his edition of Aristarchus, and from its nature it has been supposed that these first two books treated of arithmetic. The other books collect together the most interesting of the theorems of ancient geometry, the duplication of the cube, the properties of plane and solid figures, and also investigations of some of the curves of higher orders than the second. The seventh book is on geometric analysis, and is prefaced by a history of this branch of the subject, and the eighth treats of machines. His other reputed works have been lost, except a fragment of a *Commentary on Four Books of Ptolemy's Syntaxis*. There are two Latin versions of P., by Commandine (1588) and by Manolossius (1660); the Greek text was published by Eisenmann (Par. 1824).

Papu'a. See NEW GUINEA.

Papulæ and Papular Diseases. A papule or pimple is an elevation of the cutis covered by its cuticle, due to effusion of inflammatory lymph into the substance of the true skin. P. generally terminate by resolution, sometimes by slight desquamation, and occasionally by ulceration. P. D. are chronic in their course, non-contagious, and attended sometimes with itching.

Papyrus (*Cyperus Papyrus*) has recently been shown to have a much wider distribution than was formerly supposed. In Africa it probably forms a characteristic member of the tropical flora. On the White Nile, and in Abyssinia to 12° N., it was found by Bruce: by more than one authority it is stated to be abundant on the banks of the Lagos in the Niger District, and it has been gathered not only from the Congo but as far S. as Delagoa Bay. In the last century, when Bruce saw it in Lower Egypt, he did not consider it native. It is now extinct there, and the probability is that it had been originally introduced from Nubia and cultivated, gradually dying out when left to hold its ground without human intervention. In his progress up the Nile in 1872, Dr. Schweinfurth first came upon the P. in lat. 9° 30' N., below the point where the main river is joined by the Gazelle. At the westerly bend of the Nile, there is a vast jungle of P. in which the plants are 15 feet high. A passage in Strabo infers that those who had the manufacture of the writing materials from P. were careful to restrict its growth to a few places in Lower Egypt. It was also identified by Bruce in the upper waters of the Jordan, where in 1864 the Rev. H. B. Tristram saw many acres of it in the almost inaccessible marshes of the Hûlch—the waters of Merom of the Bible. He reports that the Beduins there cut down the stems for thatching purposes, and collect the roots as fuel. In this locality Mr. Macgregor (*Rob Roy*) speaks of it forming along with a cane a vast floating forest, perfectly dark inside. 'I could not penetrate more than three feet. Many of the stems were as thick as my arm. The water percolates below and through the spongy mass, and there loses at least half its volume by absorption and evaporation. The impassable barrier is about a mile wide.' Mr. Tristram also found it growing luxuriantly by the shores of the Lake of Galilee, and from a very early period it has been known as a plant of the plains of Acre and Sharon. In Sicily, where it grows on the eastern side of the island about Syracuse and Milili, and formerly growing at Palermo, the late Professor Parlatores considered it introduced from Syria in the 10th c., being first mentioned in the travels of Abn-Haukal, an Arab author of that date. But Parlatores has endeavoured to show that whilst the Sicilian plant was identical with that of Syria, it was distinct from the true P. of the Nile. The differences consist in claiming for what may be called the Mediterranean plant (*C. Syriacus*, Parl.) a spreading inflorescence like a mop, with very short linear leaflets (*bracteoles*) subtending the spikelets; and, in contradistinction, for the Nile plant (*C. Papyrus*, Parl.) a close besom-like inflorescence, with very long bracteoles, which are also more numerous. This view has not obtained general acceptance among botanists. A *Cyperus* discovered in Madagascar (*C. Madagascariensis*) is closely allied to the P., if not a

variety. It occurs also in Mauritius, but is a doubtful native there. The P. was first cultivated in a botanic garden by Cesalpinus, who introduced it to Pisa from Sicily. L'Obel saw it there, and identified it with the plant described by Theophrastus and Pliny (*Adversaria Nova*, 1576, p. 38). The earliest figure is that given by Prosper Alpinus in 1640.

P. was used in Egypt and among other civilised communities, almost exclusively in remote times, for books and written documents. The substance was prepared from the liber, or internal white pithy substance of the plant which was known to the ancient Egyptians by the name *Byblos*. The intimate relation which this plant and its products had to literature is seen in the fact that from its name P. is derived the word paper; its Egyptian name *byblos* passed into the Greek *biblion*, a book, and from *liber*, the part of the plant employed, is derived the Latin word *liber*, a book. Among the ancient Egyptians in the Upper Nile the plant was cultivated with the greatest care. It was known to the Greeks at an early date, but first came into general use among them after the time of Alexander the Great, and its manufacture continued to form for several centuries a great industry at Alexandria. Its use lingered on till the 12th c. both in the Eastern and Western Empire, but long before that time it had been largely superseded by Parchment (q. v.). The mode of preparation was simple. The white cellular tissue of the P. was separated into thin layers, and spread out on a level surface, three layers, crossing at right angles, being superimposed on each other. By pressure these, while in a damp, sappy condition, became united into one uniform sheet, which, after drying, was smoothed and softened by hammering, and polished by rubbing with an ivory rubber. P. is yet made in Sicily in small quantities, but merely as a curiosity. For books, sheets of P. were united into a continuous length, which were made in rolls (Lat. *volumina*, from *volvo*, 'I roll'), whence the modern 'volume.' The Egyptian *papyri* are of great antiquity, some probably as old as 2000 B.C. They have been found chiefly beside or upon the bodies of mummies, and relate to almost all kinds of religious and secular subjects. They are divisible into *hieroglyphical*, *hieratic*, and *demotic papyri*, according to the characters in which they are written. (See EGYPT and HIEROGLYPHICS.) The excavations at Pompeii and Herculaneum also resulted in the discovery, among other things, of a large quantity of *papyri*.

Para', the southern and most frequented branch of the Amazon, with which it is connected by several narrow and very deep channels. It is 200 miles long and 36 miles wide at its mouth, and is entirely navigable for the largest vessels. Its principal affluent is the Tocantins (q. v.).

Para', a province of Brazil, occupying the N.E. portion of that empire, and extending from the Guiana frontier to the parallel of 10° S. lat., and from 46° to 57° W. long. Area, 412,464 sq. miles; pop. (1872) 259,821, of whom 27,199 were slaves. The province consists for the most part of an alluvial plain, covered with luxuriant forests and drained by magnificent rivers, of which the principal are the Amazon, Tapajós, Xingu, and Tocantins. In addition to its forest wealth and agricultural capabilities, the province is known to possess valuable, though still unworked, natural resources in the shape of gold, diamonds, iron, and coal.—**P.**, or **Belem**, capital of the province of the same name, is at the junction of the river Guamá with the estuary known as the P. river, which is here 20 miles wide. P. was founded in 1615, but through misgovernment had a very troublous career till 1848, since which year it has steadily progressed. The streets, which are traversed by tramways, are well laid out, and are lined by handsome houses and public buildings. Of the latter, the chief are the palaces of the governor and bishop, and the cathedral. As the emporium of the Amazon valley trade, P. is of great commercial importance. During 1875 the imports amounted in value to £675,000, and the exports to £1,700,000, the principal articles of export being indiarubber, nuts, cocoa, hides, piassaba, balsam capivi, and annatto. The climate of P., in spite of its equatorial position, is remarkably healthy. Eleven newspapers are published in the town, the pop. of which in 1872 was 25,000.

Para, a small Turkish coin, usually made of copper, and valued as the 1-40th part of a Piastre (q. v.). Consequently it is about 1-18th of an English penny.

Par'able (Gr. *parabolē*, from *paraballein*, 'to compare'), as a form of conveying instruction has been almost universally employed, but its true home has always been among Eastern nations, whose exuberant imagination, combined with elevation of thought and of feeling, has made them adepts in the art of inventing and interpreting ingenious comparisons and riddles. A P. may be defined as a fictitious narrative invented for the purpose of conveying truth in a more engaging form than direct assertion. It has been distinguished from the Fable (q. v.), as being intended 'to set forth a truth spiritual and heavenly;' from the Myth (see MYTHOLOGY), in which the vehicle of a truth and the truth itself are blended together, by the distinctness always apparent in the P. between the shell and the kernel; from the Proverb (q. v.), which is more concentrated than the P., and generally more obscure; and from the Allegory (q. v.), by keeping distinctly apart the two things compared, while in the allegory the properties and qualities of the one thing are transferred to the other. See Trench's *Notes on the Parables of Our Lord*, (9th ed. Lond. 1864).

Parab'ola is a plain curve of the second order, and may be defined as the locus of the point whose distances from a given point and a given straight line in the plane of the curve are equal. The given point is called the focus, and the straight line the directrix. The line drawn through the focus perpendicular to the directrix is the axis of the P., and the line drawn from any point in the curve parallel to the axis is a diameter. From the method of its description, the curve can meet a diameter in only one point, so that a P. is a curve with infinite branches. The point where the curve cuts the axis is called the vertex, and the perpendicular from the vertex upon any tangent-line intersects that tangent-line in the directrix. Chords drawn parallel to the tangent at a given point are bisected by the diameter drawn through that point—a property common to the other conic sections—the circle, ellipse, and hyperbola. The P. is the curve in which a right cone is intersected by a plane parallel to the side of the cone; and this view of the curve also indicates its non-closed nature. It may be regarded indeed as the limit of an ellipse, whose eccentricity is increased indefinitely; and the portions of a very eccentric ellipse which are close to the extremities of the major axis may be treated as portions of parabolas. Thus the paths of comets at their perihelion passage are calculated as parabolic. The focal line and the diameter through a given point make equal angles with the tangent at that point; or their contained angle is bisected by the normal. Hence all rays of light parallel to the axis are reflected from the internal side of a P. or paraboloid (see PARABOLOID) so as to pass through the focus. The equation to the P. referred to its vertex as origin is $y^2 = 4ax$, where x is measured along the axis, y along the tangent at the vertex, while a is the distance of the focus from the vertex or of the vertex from the directrix. When $x = a$, $y = \pm 2a$, and the double ordinate $2y$ ($= 4a$) through the focus is called the *parameter* or *latus rectum*. If the origin be transferred to any point on the curve, and the co-ordinate axes be taken along the diameter and along the tangent at the point, the equation still retains the same form, and a is still the focal distance of the *origin* from the focus. In analysis, any curve having an equation of the form

$$y^{m+n} = a^m x^n$$

is called a P. There are two of the third order, $y^3 = a^2 x$, the *cubical P.*, and $y^3 = ax^2$, the *semicubical P.*

The quadrature of the common P. was effected by Archimedes, who proved that the area enclosed by an arc, the diameter through one of its extremities, and the ordinate through the other, was equal to two-thirds of the parallelogram constructed on the ordinate and abscissa. The P. is also the curve which a projectile describes under the action of a constant force acting in one invariable direction. See PROJECTILES.

Parabola'ni (Gr. *parabolaneis*, from *paraballesthai*, 'to expose one's life to danger') were an inferior order of the clergy in the early Church, first mentioned in the Theodosian Code (415), although there spoken of as an existing institution. Their duties were to wait upon the sick, especially in times of pestilence. At Alexandria they were incorporated into a society to the number of 500 or 600, and were chosen out of any class except those who were bound to serve in civil offices. At first under the government of the chief civil magistrate, they were afterwards put under the entire control of the Bishop.

Paraboloid is generally any surface of the second order, some of whose plane sections are parabolas. Elliptic and hyperbolic paraboloids are distinguished according to the nature of their other sections. The *P. of Revolution* is generated by the rotation of a parabola round its axis. Its section by a plane perpendicular to the axis is therefore a circle. In physical science, this surface is interesting as the form of surface which should be given to a reflector, so that parallel rays may be all reflected to one definite focus. See **PARABOLA**.

Paracelsus, whose proper name was **Philippus Aureolus Theophrastus Bombastus von Hohenheim**, a celebrated physician, alchemist, and mystic, was born December 17, 1493, at Maria-Einsiedeln in the Swiss Canton of Schwyz. His early education was conducted by his father, Wilhelm Bombast von Hohenheim, who practised as a physician; but later he studied at various universities, attending the lectures of celebrated professors, at the same time frequenting the laboratories of the alchemists and the workshops of the necromancers. This early wandering life showed him many of the falsities then prevailing in the schools of medicine, which required, in his estimation, a thorough reformation. He travelled through Italy, the Netherlands, and Denmark, supporting himself by working wonderful cures. He seems to have become acquainted with the properties of several medicinal substances, among others *Laudanum*, which was so named by him. On his return to Germany, the cures he effected secured him a wide reputation, and in 1527 he was appointed Professor of Medicine at Basel. He speedily, however, roused the hatred of his colleagues by his attitude towards the old physicians, whom he openly condemned, going the length even of burning the works of Galen and Avicenna. In 1528 he was forced to leave Basel, and thereafter he led a wandering and dissipated life; still, however, retaining his skill and maintaining his reputation as a physician. In 1541 he was called to Salzburg to be physician to Archbishop Ernst; but soon after, on September 23d of the same year, he fell a victim to the hatred of his enemies. Alchemist and mystic though he was, and imperfectly educated at best, he was not the mere quack or charlatan which his earlier biographers represented him to be. He had a varied store of knowledge, derived from his peculiarly chequered experiences; and there is little doubt that he made not a few important discoveries in chemistry and medicine. His ungoverned spirit of reform unquestionably influenced for good the imperfect science of his time. He wrote an incredible quantity of manuscript, very little of which he published himself. Complete editions of his works appeared at Basel (10 vols. 1589), Strassburg (3 vols. 1616-18), and Geneva (3 vols. 1658). See Lessing's *P. sein Leben und sein Wirken* (1839), Marx's *Zur Würdigung des Theophrastus von Hohenheim* (1842), and Lindner's *Theophrastus als Bekämpfer des Papstthums*. A bibliographical study of his writings by Friedrich Mook (Würzburg, 1876) is laborious and useful, though not free from grave errors.

Parachute (Fr. *parer*, 'to ward off,' and *chute*, 'a fall'), an apparatus shaped like an umbrella, designed to enable a descent to be safely made from a balloon or an eminence. Its use was suggested as a means of escape from a building on fire by M. le Normand, and in 1783 he proved its efficiency by alighting unhurt from a lofty house at Lyons. M. Blanchard applied it to the balloon, but his first descent in it was so rapid that his leg was broken through violent contact with the ground. Subsequently Garnerin, the French aeronaut, made frequent descents from great altitudes by the aid of a P. While in London in 1802, one of its stays giving way caused extreme oscillations of the apparatus, so that he narrowly escaped death by being thrown out in mid-air. Garnerin's P. resembled a large umbrella; the cover, of canvas, was 23 feet in diameter, and a basket car for the aerofaut was suspended from the framework. The P. was attached by a rope to the netting of the balloon, and on being separated from it, the resistance of the air opened up the loosely hanging cover, and after a few seconds of accelerating descent, the machine fell slowly with an oscillating motion to the earth. Mr. Cocking devised a P. in the form of a flattened inverted cone, which he believed would prove steadier in the air than Garnerin's. In 1839 he attempted to descend from a balloon in it, but lost his life owing to a flaw in the construction. For a description of the P. light ball, used in warfare for illuminating an enemy's camp, see **BALL**.

Parade (Sp. from Lat. *parare*, 'to prepare'), (1) the mustering of troops in full equipment for inspection or exercise; (2) the ground set apart for such purposes and for reviews.

Paradise, the word used in the Septuagint for the 'garden' that God planted 'eastward in Eden' (Gen. ii. 8). It is first used in classical Greek by Xenophon, and denotes a 'park' or 'pleasure-ground.' The word is probably of Aryan origin, as it occurs in Sanskrit under the form *paradisa*, and doubtless reached the Greeks through Persia; but it passed into the Semitic group of languages, and is found in Hebrew as *pardis*, and in Arabic as *firdaus*. See **EDEN**.

Paradise, Bird of. See **BIRD OF PARADISE**.

Parados (Fr. *parer*, 'to defend,' and *dos*, 'the back'), or **Traverse**, a mound of earth thrown up at various parts of fortifications to protect defenders from a reverse fire.

Paradox (Gr. *para*, 'contrary to,' and *doxa*, 'opinion'), a term applied by the Stoics to maxims opposed to the prejudices of the vulgar, such as 'wisdom alone is wealth;' and in modern parlance to a figure of rhetoric which couples two seemingly conflicting ideas, as Cicero's 'clamorous silence,' Tacitus's 'conspicuous by their absence,' or Boileau's 'retrieving honour by his infamy.' The besetting danger of all paradoxes is lest their seeming contradictions should become real, as pointed out by Bishop Horsley in his 19th Sermon.

Paradoxides, a well-known genus of *Trilobites* (q. v.), forming the type of the family *Paradoxidae*, the members of which have long bodies, the segments of the thorax or chest being free, and numbering from eight to twenty-three. The caudal or tail-shield is small. Some of the largest of the trilobites belong to this group. Its members are chiefly found as fossils within the well-known 'primordial zone' of the Upper Cambrian rocks.

Paradoxure (*Paradoxurus typhus*), a species of *Carnivorous* quadrupeds allied to the *Viverrida* or weasels, &c., and found in India. The common P., or luwack as it is named, is a familiar Indian species, as is also the musang (*P. musanga*) of Java. The luwack is of a dingy yellow colour, spotted with black. The tail is long and is capable of being closely coiled or twisted. The musang is noted for its ravages on rats and mice, but it also feeds on berries and fruits.

Paraffin, and **Paraffin Oil**. P. (from Lat. *parum*, 'little,' and *affinis*, 'likeness or relation,' in allusion to its resistance to all chemical re-agents) was first described by Baron Von Reichenbach in 1830, who isolated it from the tar of beech wood. A fatty substance had been previously extracted from an earth oil obtained at Tegernsee, in Upper Bavaria, by Herr Buchner, which was subsequently ascertained to be P. The substance, however, continued to be regarded merely as a scientific curiosity, till, in 1847, Mr. James Young obtained it on a considerable scale as a by-product in the distillation of an oily exudation occurring in a Derbyshire coal-mine. In 1849 a patent was obtained by Mr. Reece for distilling P. and P. O. from Irish peat; but although much was hoped from this new industry, it failed to be commercially remunerative. The material operated on by Mr. Young, above alluded to, having been exhausted, that gentleman began a series of researches, which resulted in the discovery that by the dry distillation of bituminous coal he obtained an oily liquid containing P., and for this discovery he, in 1850, secured a patent which may be regarded as the basis of the now great P. industry. Subsequently attention was drawn to numerous other sources of P. and P. O., and now these substances are obtained (1) by the distillation of bituminous shales, ordinary coal, and brown coal; and (2) they are prepared and purified from certain petroleum or native 'tars,' and from ozokerite, a native fatty substance found in Galicia, and under the name of *neft-gil* at Baku, on the shores of the Caspian Sea, in which substances the P. exists ready formed. In Great Britain the principal source of P. and P. O. is now the bituminous shales which occur most abundantly in the Scottish coal-fields; the first great raw material used; the famous Boghead mineral or cannel coal, being exhausted. In Germany, brown coal is much distilled, in Austria ozokerite is extensively worked, and in Russia P. and P. O. are obtained from the *neft-gil* of Baku. Rangoon petroleum, or earth oil, has for a long period been imported into England, and used by the large manufacturing

firm, Price's Candle Company, and it was P. from this source that was first extensively made into candles in 1857, under a patent obtained by Mr. Warren De La Rue in 1854, the burning oil separated from it having been sold as 'Belmontine.'

The processes of distillation of these hydrocarbons from shale, as conducted in Scotland, may be briefly indicated. The shale is broken into pieces about the size of road metal, and filled into horizontal retorts, which are brought to a low red heat, care being taken to keep the heat low, so as to prevent the formation of gaseous products. The tar or oil produced in this distillation is exceedingly impure, and it is subjected to a second distillation, by which 'once run oil' is produced, coke being left in the retort. The 'once run oil' is mixed with oil of vitriol, allowed to settle, neutralised with caustic soda, and submitted to fractional distillation, yielding first a light naphtha, second the chief part of the burning oil, and third the heavy oil which contains the solid P. The three sets of products so obtained are submitted to further distillations and other operations. The first fraction, naphtha, is again fractionally distilled into P. spirit and light oils; the second, or burning oil portion, is again treated with acid and caustic soda, and re-distilled, the first portion of the distillate going to the naphtha tank, while the last is added to the heavy oil, leaving the bulk as finished burning oil. The heavy oil now contains the whole of the solid P., to separate which the liquid is cooled by artificial means, pressed, to separate as far as possible the liquid from the solid portion, and thus crude P., or P. scale is obtained. The oil, from which the scale has been separated, is treated with sulphuric acid and caustic soda, and fractioned by distillation, as in the case of the burning oil above alluded to, the bulk of the product forming lubricating oil. The P. scale is a brown scaly substance highly impregnated with oil, and consequently possessing the characteristic smell of unrefined P. oil. The crude P. is purified by repeatedly mixing it with light oil (naphtha), cooling and pressing, by which the adhering oil and the softer portions of the P. are separated. It is then melted, steam is blown through it till every trace of naphtha disappears, it is treated with animal charcoal, and when that has subsided it is run into moulds, and cools to a beautiful translucent and semi-crystalline mass. Pure P. is inodorous, tasteless, and nearly as hard as beeswax when cold; it rapidly becomes soft and plastic when heated, and it forms a thin, highly mobile liquid when melted. It is a pure hydrocarbon, containing about 85·2 carbon and 14·4 hydrogen; its melting point varies from about 90° to 176° F.; and its specific gravity ranges from ·843 to ·940, according to its source and purity, that of low melting point having a correspondingly low specific gravity. It will thus be observed that the distillate of carbonaceous substances obtained at a low red heat consists of a mixture of hydrocarbons, which are ultimately separated into (1) light oil, spirit, or naphtha, (2) burning oil, (3) lubricating oil, and (4) solid P. The Scottish P. manufacture is now one of great extent and importance, as will be evident from the following figures, which apply to the year 1873, a year during which it was in the full tide of success. In that year the shale consumed was 800,000 tons, yielding 25,000,000 gallons of crude oil, and from which 5800 tons of purified P. were extracted, and 9800 tons of lubricating oil prepared. As a by-product of the manufacture, 2350 tons of sulphate of ammonia were secured; and in the various operations connected with the industry 500,000 tons of coal were used. The principal use of P. is for making candles, in the moulding of which a certain proportion of stearine is added; but it is also used in lucifer match-making as a substitute for sulphur, now almost entirely abandoned. It may also be employed as a substitute for wax in modelling fruit, flowers, &c., and it has numerous minor adaptations.

Para Grass. See PIASSABA.

Paraguay ('the place of waters'), a S. American republic included between 22° 5'–27° 20' S. lat., and 54° 35'–58° 40' W. long. It is bounded on the N. by Brazil, on the W. by the disputed territory of the Gran Chaco and by the Argentine Republic, on the S. by the Argentine Republic, and on the E. by the same state and Brazil. Area, 57,000 sq. miles, or a little less than that of England and Wales. The country—the only one in S. America without any seaboard—is bisected longitudinally by the Sierra Anambahy, a range from 1000 to 2000 feet high, which forms the watershed and divides P. into two sections differing from each other materially in physical characteristics. That on the E. side is hilly, densely

wooded, and wholly uncivilised. The W. section is more level, and the forests largely give place to plains clothed with tall, rank grass, well adapted to the rearing of cattle. The northern portion of P. is a desolate region, its forests being tenanted only by a few wandering Indians, and even animal life being scanty. Farther S., on the western watershed, is a plateau 200 feet above the level of the P. river, and on it the principal settlements exist. The S. W. angle between the P. and Paraná rivers consists of extensive marshes and lagoons. Of the latter the largest is the Ypoá ('lucky water'), which has an area of 100 sq. miles. It is the only considerable lake in P., that of Yparacay (24 sq. miles) being the next largest. The principal rivers are the P. (q. v.), which forms the W. boundary, and the Paraná (q. v.), which bounds P. on the S. and for more than half its length on the E. Of the purely Paraguayan rivers the largest from N. to S. are the Aquidaban, Ypane, Jejui, and Telicuary. The last-named, which is much the most important, has a very tortuous course of nearly 200 miles, and is navigable by small craft for most of its length. The climate of P., though hot and unsuited to European colonisation, is on the whole healthy, except in the marshy districts. The vegetation is luxuriant, and the forests yield splendid timber and many kinds of ornamental woods. The wild animals include the jaguar, capybara, tapir, armadillo, deer, and pigs; while among the birds the most common are parrots, wood partridges, wild turkeys, and the rheu, or S. American ostrich. Alligators swarm in the rivers, and insect life is abundant to the furthest limit of human endurance. Gold and iron are found in small quantities, but with this qualification P. may be said to be wholly without mineral resources. The principal cultivated crops are tobacco, cotton, and the sugar-cane. Coffee and indigo also grow well, but their cultivation has ceased since the war. The principal export is that of Maté (q. v.) or P. tea. If the requisite labour were obtainable, rice could be extensively grown in the *esteros*, or marshy districts, in the S. W. In 1875 the revenue was £121,817, and the expenditure £150,000; in 1876 the public debt amounted to £1,562,783.

The first European who set foot in P. was Sebastian Cabot, who sailed up the Paraná and entered the P. river in 1526. Asunción, the capital, was founded in 1536, and for nearly a century was a place of much importance. From 1609 the country was for 158 years under the sway of Jesuit missionaries, and enjoyed great prosperity. They were expelled in 1767, and in 1776 P. was included in the new viceroyalty of La Plata, but in 1811 asserted its independence and became a republic. In 1814, however, it submitted to the yoke of Dr. Francia (q. v.), who as dictator ruled it with an iron hand till his death in 1844. During his *regime* P. was most rigidly isolated from the rest of the world. Francia was succeeded by Don Carlos Antonio Lopez, who in some degree relaxed his predecessor's policy of isolation. He died in 1862, and was succeeded by his son, Don Francisco Solano Lopez, who brought on war between P. and the allied states of Brazil, the Argentine Republic, and Uruguay. The Paraguayans maintained a heroic but unavailing resistance from 1865 to 1870, and the war was ended by the defeat and death of Lopez at the battle of Aquidaban on 1st March 1870. In June of the same year Congress voted a new constitution, which was proclaimed in the November following. It consists of a legislature called the Congress, composed of two houses, with a president, who is elected for six years, as the executive. An attempt at insurrection in 1874 was quelled by the aid of the Brazilian garrison which is still (1878) quartered in Asunción, and Brazil may yet be said to exercise a semi-protectorate over P.

The great war utterly ruined P., decimating its population and reducing the inhabitants who were left to a state of miserable poverty. Not only was the country's trade annihilated, but its very means of subsistence were in part destroyed. For instance, though P. is a fine grazing country, and previous to the war possessed large herds of cattle, it now imports all its beef from the Argentine Republic, whence the cattle are driven in large numbers across the Paraná, and long distances into the interior of P. It is difficult to form a close estimate of the present pop. of P. In 1860 it was estimated by DeMersey at 600,000, and in 1873 (after the war) by Helm at 221,070, though Mr. Keith Johnston thinks this to be much above the mark. The inhabitants consist of Indians, Spanish half-breeds, negroes, and pure Europeans, of whom Italians are the most numerous. The Indians belong to the great Guaraní race, which once extended from the Orinoco to the Paraná. The capital, Asunción,

situated opposite the confluence of the Pilcomayo with the P. river, has a pop. of about 10,000, of whom 3000 belong to the Brazilian garrison of occupation. There is a railway from Asuncion to Paraguari, about 35 miles S.E. See *Voyages dans l'Amérique Méridionale*, by Felix de Azara (Paris, 1809), *La Plata, the Argentine Confederation and P.*, by Thomas J. Page (New York, 1859), *Letters from the Battle-fields of P.*, by Captain R. F. Burton (Lond. 1870), *P., Brazil, and the River Plate* by C. B. Mansfield (Lond. 1871), and four articles by Keith Johnston in the *Geographical Magazine* for 1875.

Paraguay, a river of South America, issues from seven lakes in the interior of Brazil in $13^{\circ} 30'$ S. lat., $55^{\circ} 50'$ W. long., at a height of 9530 feet above the sea. It has a general southerly course of 1300 miles, with an average breadth of half a mile, and the country through which it flows is usually well-wooded and fertile, except where marshy. While still in Brazilian territory the P. flows through the marsh of Xarayes, which is 200 miles long, and in the rainy season expands to a great width. In the latter part of the course of the P. lateral channels, known as *riachos*, are frequent. It finally unites with the Paraná (q. v.) in $27^{\circ} 20'$ S. lat. The principal tributaries of the P. are the Cuyabá and Tobicuary on the left bank, and the Pilcomayo (q. v.) and Vermejo on the right bank. Asuncion, the Paraguayan capital, situated at the confluence of the Pilcomayo, is the principal town on the banks of the P. The current of the river being moderate, and the channel deep and free from obstructions, it is navigated by steamers for two-thirds of its length, and by small craft for a considerable distance farther up.

Paraguay Tea. See **MATE**.

Parahyba, a province in the E. of Brazil, bounded by the Atlantic and the provinces of Rio Grande do Norte, Ceará, and Pernambuco. It has an area of 20,346 sq. miles, is mountainous, and liable to severe droughts. Cotton and sugar are the chief articles of export. Gold is found in various parts. Pop. (1872) 362,557.—**P.**, capital of the preceding province, is situated on the P. ('bad water') river, 10 miles from its mouth. It has two colleges, a cathedral, and several convents, and is fortified. Pop. about 15,000.

Parallax is the apparent displacement of an object due to change of position of the observer, and is measured by the angle contained between the lines drawn from the object to the two positions of observation. Obviously, for a given change of position, the greater the distance of the object the less must the P. be; and if the object be sufficiently far off, the P. may become quite inappreciable. In astronomy the term P. is employed generally in a very limited sense. It is the correction which must be applied to the observed position of a heavenly body to reduce it to its true *geocentric* position—i.e., its position as viewed from the centre of the earth. When the heavenly body is in the zenith of the observer, this correction is at its minimum—zero; namely; and when the body is in the horizon, the correction is at its maximum, and is then called the horizontal P., its value being the arcual angle subtended by the earth's radius at the position occupied by the observed body. The only body whose P. can be directly determined by observations from the earth is the moon, whose equatorial horizontal P. has a mean value of $57' 4''$. The corresponding quantity for the sun is somewhat less than $9''$ —a quantity too minute to be measured directly. The parallaxes of the planets Mars and Venus—the former at opposition, the latter only at transit—can, however, be directly measured with considerable accuracy, and from these the P. of the sun can be calculated (see **SUN**). The fixed stars are so distant, that even the fraction expressing the geocentric or diurnal P. of the nearest of them is utterly meaningless on account of its excessive minuteness. The heliocentric or annual P.—P. due to change of position of the earth in its orbit—of 61 Cygni is, according to Bessel, $0'' 348$, which is equivalent to the 15-millionth part of a second of geocentric P.

Parallel, a term of extensive application in geometry. According to Euclid, P. lines are straight lines which are in the same plane, and which being produced ever so far both ways never meet. Similarly P. planes are planes which extended ever so far in any direction never meet. Such planes have evidently the same normal; and the definition that P. planes are such as have the same normal can be applied to any curves or surfaces. Generally, then, P. curves or surfaces are any curves

or surfaces which have the same system of normals. Concentric circles or spheres form a P. system; also confocal ellipses and ellipsoids, and all involutes of a common evolute. To the mathematician such a conception of parallelism presents no difficulty. At the very beginning of the study of P. lines, however, there is a peculiar difficulty, to surmount which has been the endeavour of many famous geometers. The difficulty is not one of conception but one of demonstration—to pass, namely, from the definition to the proposition that a line falling upon two P. lines is equally inclined to both. To prove it, Euclid was forced to assume as an axiom that, 'if a straight line meet two straight lines so as to make the interior angles on the same side of it less than two right angles, these straight lines being continually produced will at length meet on the side on which the angles are which are less than two right angles.' This, however, is as much a proposition as the seventeenth in the First Book, of which it is the converse, and is therefore not a self-evident truth. Later geometers—Wolfius, Bosovich, Simpson, &c.—have substituted for it other axioms; but these also are open to the same objection, and are more fitly called postulates. Legendre has met the difficulty by establishing the whole theory of P. upon the proposition that the three angles of a triangle are together equal to two right angles. In Euclid this proposition depends for its demonstration upon the previous propositions respecting parallels; consequently Legendre was compelled to prove it by a totally different method. This demonstration is exceedingly refined and subtle, but for that very reason is not admissible into books on elementary geometry.

Parallel Forces are forces which act upon a body in directions parallel to each. Let P Q be two parallel forces acting at the

Parallel Forces.

Hence the resultant of two parallel forces acting at two points of a rigid body is in the same direction, has a magnitude equal to the sum of the two original ones, and acts at a point which divides the line connecting the first two points in a ratio which is inversely as the corresponding forces. The extension of the proposition to any number of parallel forces is obvious. If P and Q had been in opposite directions, the combination would have been of the nature of a couple, and it would have been impossible to represent it by a single resultant force. See **COUPLE**.

$$AB : CB = Q : P.$$

Parallel Motion is the name given to conversion of circular motion into rectilinear motion by means of link-work. Watt's P. M. is familiar to all from its extensive use in steam-engines; but it is only an approximation to true P. M. It consists essentially of three links, AB, BC, CD, of which the first and last are equal and have their extremities A and D fixed. The middle point P of the link BC describes a very near approximation to a straight line, as the C and B move in their respective circles. True P. M. can be effected

Parallel Motion.

only by the use of a more complex link-work. The simplest form consists of no less than five links. See *PEAUCELLIER CELL*.

Parallelogram, in Mathematics, is a quadrilateral whose opposite sides are equal and parallel. Its opposite angles are therefore equal, and either diagonal bisects it. Particular forms are distinguished further by peculiar names, such as the square, the rectangle, and the rhombus.

Parallelogram of Forces is the name frequently applied to the geometrical construction by which the resultant of two given forces is obtained. See *COMPOSITION AND RESOLUTION OF VELOCITIES AND FORCES*.

Parallelopiped, a solid figure bounded by three pairs of parallel planes. Its six faces are parallelograms, and its twelve edges consist of three sets of four equal and parallel straight lines. Its volume is equal to the area of any one face multiplied by the perpendicular distance between this face and the opposite and parallel one. The *cube* is a particular form of P. in which all the edges are equal.

Parallels, in Geodesy, is the name given to the circles of latitude, which are small circles drawn on the terrestrial sphere parallel to the equator. See *LATITUDE*.

In military language, P. are the trenches formed by an attacking army parallel to the attacked work. They are connected to each other by approaches or zigzag trenches.

Paralysis (Gr. *para*, 'through,' and *luō*, 'I loose') is a disease the chief characteristic of which is loss of motor power or sensitivity in one or more parts of the body. The loss of motor power, in the parts affected, is the most striking characteristic, and when the loss is incomplete it is now often termed *paralysis*; but, when complete or nearly so, it is termed P. P. may be general or partial according as the whole or only part of the body is affected. When limited to one side it is termed *hemiplegia*; and, when to the lower half of the body, *paraplegia*. When a small portion of the body only is affected it is called *local P.*; and if the nerve specially affected is known it is designated accordingly, thus, *facial P.*, *P. motor oculi*, &c. P. may be due to certain occupations, and hence the designations *lead P.*, *mercurial P.*; or it may be associated with certain symptoms from which it derives its name, as *wasting P.*, and *P. agitans*. In most cases, sensitivity and motor power are simultaneously lost or impaired. When motion alone is lost the affection is called *akinesia*, and when there is a loss of sensitivity only it is termed *anesthesia*. P. is a symptom of certain diseases of the nervous system, and is purely a nervous affection. In most cases it is a symptom of disease in some other part of the body than that in which the P. exists, as in the brain or spinal cord, or in the nerves proceeding therefrom; but it is sometimes a purely local affection depending upon a morbid condition of the terminal extremities of the nerves. The various morbid conditions which may give rise to P. are described under *Diseases of the Nervous System* (q. v.); but it is highly probable that P. may sometimes result from mere functional disorder of the *cerebro-spinal* centres, as a post-mortem examination frequently fails to reveal any apparent lesion.

The following are among the more prominent paralytic affections. *General P.* is a gradually advancing form of the disease which sooner or later involves nearly every muscle of the body, and is invariably associated with mental derangement. The mental and physical symptoms are generally both present from the first appearance of the disease; but the latter are frequently obscure except to the specialist. The psychical symptoms are generally aberrations of the moral faculties, and more frequently relate to exaggerations of position, power, and wealth. The physical symptoms are most commonly P. of the lips and tongue, leading to defective, blurred articulation; and of the facial muscles, giving the face a blank, stupid look. The disease, as its name indicates, progresses to an invariably fatal termination, and death occurs from difficult deglutition leading to choking, or from exhaustion. *General P.* is an incurable disease.

Hemiplegia (q. v.), is generally called a *paralytic stroke*, and is most commonly due to cerebral hæmorrhage. The left side of the body is most frequently paralysed, although the actual seat of the lesion is, in the great majority of cases, on the right side of the brain, the phenomena being accounted for by the decussation of the pyramids. Hemiplegia may be permanent;

but when otherwise the restoration of power appears first in the leg. The active *local treatment* of the disease is recommended to be commenced about two weeks after the original seizure, in the form of friction over the paralysed parts, with flexion, and extension of the joints. Preparations of phosphorus may be given internally and strychnia may be injected subcutaneously; but the most reliable remedy is electro-galvanism.

Paraplegia seldom partakes of the character of a paralytic stroke, and has usually an insidious commencement, the premonitory symptoms being weakness, coldness and tingling in the feet and legs, gradually increasing until the power of motion is gone. The muscles of the lower part of the trunk and of the bladder and rectum are often affected, and rest is frequently disturbed by involuntary movements of the limbs. P. may be caused by caries of the vertebrae, by concussion or compression, congestion, inflammation, or softening of the spinal cord or its membranes.

Reflex P., the most favourable form as regards cure, may accompany and depend upon other affections, as hysteria, pregnancy, worms, or urinary diseases. The *treatment* of the disease depends on whether the P. is primary or secondary, dependent on congestion or diminished nutrition. In the former case, the ergot of rye should be administered internally, and belladonna applied externally, as both of these remedies contract the vessels of the cord and its membranes; but, in the latter case, strychnia combined with opium, if there is much restlessness, should be administered, and the patient should be put on a generous diet.

Facial P., sometimes called *Bell's P.*, is an affection of the portio dura, or facial portions of the seventh pair of nerves either at its origin or in its course, or as the result of pressure, causing P. of motion, more or less complete, of the muscles supplied by the nerve. In such cases the expression of the countenance is very peculiar, one side of the face being natural and the other having a blank unmeaning expression. The eye of the side affected cannot be closed, tears run over the cheek, the mouth cannot be pursed up to whistle, nor expanded to smile. When *facial P.* is the result of cold, debility, or syphilis, recovery may be effected in from six to eight weeks, but when it is dependent on cerebral or intracranial lesions the prospect of cure is doubtful. The most successful mode of *treatment* consists in general hygienic measures and tonic remedies, especially strychnia, and the persistent use of electricity, one pole of the induced current being placed over the point of exit of the nerve, while the other is applied in succession over the various muscles supplied by it.

Mercurial P. or *tremor* is characterised by tremors and jerking of the voluntary muscles, commencing in the arms and extending to the legs, tongue, and jaws. The disease is caused by long continued exposure to the fumes of mercury. *Lead P.* is peculiar to those engaged in occupations which bring them in contact frequently with white lead, the symptoms being P. of the extensors of the wrist and fingers, and wasting of the ball of the thumb, constituting what has been termed 'the drop wrist.' In such cases, the *treatment* consists in withdrawal from the cause to a fresh, pure atmosphere, and giving iodide of potassium. Electro-galvanism is also beneficial.

Wasting palsy, or *progressive muscular atrophy*, depends, apparently, on a slow, chronic inflammation in the anterior tract of the grey matter of the spinal cord. The disease is characterised by loss of strength in certain muscles of the body, particularly the shoulders, arms, and hands, followed by atrophy of the muscular tissue, progressing until every muscle of the body may be involved, with the exception of the muscles of the eyeball, or the levator palpebræ superioris. The prognosis is unfavourable, and the *treatment* consists in hygienic measures, and the steady employment of the continuous and interrupted currents, with tonics.

Infantile spinal P. depends upon inflammatory softening, leading to degeneration and atrophy situated in the anterior horns of the grey matter in the spinal cord. The symptoms are fever, convulsions, and pain in the back. Generally one limb only is affected, or the P. may be restricted to a group of muscles or embrace the four limbs. The temperature of the affected limb is lower than that of the others. The *treatment* is local and general. The induced current should be applied directly to the skin over the paralysed muscles, followed by friction, several times in the course of a day. Ergot of rye is useful, but if the stage of atrophy is reached, strychnia must be administered. If muscular contractility is lost to the induced

current, the cure will be difficult and the treatment protracted; and if the primary current is also powerless, a cure is impossible.

Paramaribo, the capital of Dutch Guiana, is situated on the W. bank of the river Surinam, 10 miles from its mouth. P. is protected by a fort, and is of rectangular form, measuring a mile and three-quarters in length by three-quarters of a mile in breadth. The streets are wide, and are lined with orange, lemon, and tamarind trees. The houses are mostly of wood, painted white and green, and the public buildings are of a very ordinary description. The chief among them are the barracks, military hospital, governor's residence, and the churches. Of the last there are eight, the leading religious denominations being the Moravians and Roman Catholics. Three-fourths of the trade of the colony (see statistics given under GUIANA, DUTCH) pass through P., which has consequently shared largely in the depression which has followed the emancipation of the slaves in Dutch Guiana in 1863. The principal articles of the yearly decreasing exports are sugar, rum, molasses, cocoa, coffee, and cotton. The climate of P. is very humid, the mean annual rainfall being about 100 inches. Nevertheless the town is healthy as compared with the capitals of British and French Guiana. Pop. (in 1871) 20,477.

Paramatta or **Parramatta** is a fine fabric used for ladies' dresses, and consists of a cotton warp shot with merino-wool. The original stuff was made with P. wool, hence the name.

Parameter, in Mathematics, is a magnitude, whose value is constant for any one given function, curve, or surface. If the P. is made to vary, other members of the same system or class are obtained. Thus in the parabola $y^2 = px$, p is the P. As long as it remains constant we are kept to the same curve; but when it is altered in value we pass to another totally distinct curve, belonging, however, to the same family.

Paramœcium, a familiar genus of *Infusorian* (q. v.) animalcules, popularly, and from its shape, described as the 'slipper-animalcule.' It is a typical member of the infusorian group, and is found in stagnant water and amidst organic infusions. The *cilia* fringing the body can be well seen in P. *P. bursaria* and *P. aurelia* are familiar species.

Paraná, a province in Southern Brazil, bounded on the N. by the provinces of San Paulo and Matto Grosso, on the W. by Paraguay, on the S. by the Argentine Republic and the province of Rio Grande do Sul, and on the E. by the province of Santa Catharina and the Atlantic Ocean. Its area is 108,557 sq. miles, and its pop. (1872) 126,722, of whom 10,560 were slaves. P. is mountainous, enjoys a very healthy climate, and is well suited to cattle-rearing. Its mineral wealth is great, iron and coal being plentiful, and diamonds, mercury, manganese, antimony, and rock-salt being also found within its borders. It is drained by the river Paraná (q. v.) and numerous tributaries of that stream and the Uruguay. The capital is Curitiba, and the only seaport Paranaguá, a place of 3000 inhabitants with a considerable trade in maté.

Paraná ('like the sea'), a great river of S. America, rises in the Serra da Mantiqueira, the highest range in Brazil, at a distance of only 110 miles W. of Rio de Janeiro, and after flowing W. and S. for 2400 miles, unites with the Uruguay in 34° S. lat., 58° 40' W. long., to form the estuary known as the Rio de la Plata. The P. is a rapid stream, and in the upper part of its course its navigation is broken in two or three places by cataracts, the largest of which is that of Guayrá, in 24° 30' S. lat. There the river, suddenly contracted from two and a half miles to sixty-five yards in width, leaps over a ledge of rock at a slope of 50°, with a vertical fall of 60 feet. For the last 900 miles of its course the banks of the P. are level and the current more moderate, but the water is muddy throughout. The channel attains a great width, and is full of islands covered with trees, mostly willows, haunted by numerous jaguars. It is now regularly navigated by steamers as far as Ytupia, in 27° S., and to a smaller degree by sailing craft. The chief towns on its banks are Corrientes, Santa Fé, and Rosario.

Parapet (Ital. *parapetto*, from *parare*, 'to guard,' and *petto*, 'the breast,' Lat. *pectus*) a low wall originally used only to protect the ramparts of fortifications, but afterwards employed

on ecclesiastical and other buildings. The P. of a fortification may be either plain or with Battlements (q. v.), and is frequently pierced with 'oilets,' or apertures for the discharge of missiles. In Norman churches and houses the P. is usually plain. This is also generally the case in Early English, though rich buildings are sometimes panelled or pierced with trefoils and other figures, while in the Perpendicular style this panelling and piercing is very common. For P. in fortification see BREASTWORK.

Paraphernalia (Gr. *para*, 'beside,' and *phernē*, 'what is brought by a wife'; hence 'a dowry'), a word introduced into English from the Roman legal phrase *paraphernalia bona*, the goods which a wife brought to her husband over and above her dowry, is used in English law to denote those articles of dress and ornament which are personally used by a married woman. Where a marriage settlement has not been made, the wife's P. are exempted from the general law that her property falls unconditionally to her husband. If they were the gift of the husband he may sell them, or they may be seized by his creditors, except that part of them which is necessary apparel. When the P. have been the gift of some other person, whether before or after marriage, they cannot be taken possession of by either the husband or his creditors. Under the law of Scotland this latter privilege attaches to the wife's P. however acquired, and the term is also extended to embrace articles of household furniture.

Paraphrase (Gr. from *para*, 'beside,' and *phrazein*, 'to say') is a saying of the same thing in different words. When used in connection with rendering one language into another, it means a translation which is not literal, but slightly expanded so as to elucidate the meaning. In Scotland by *The Paraphrases* is understood metrical versions of certain passages of Scripture, which are used along with the metrical version of the Psalms in the public worship of the Presbyterian Church.

Paraplegia. See PARALYSIS.

Parasite (Gr. *para*, 'beside,' and *siten*, 'to feed'), literally one who eats at another's table, i.e., at his expense. The term is generally applied to the needy table-friend of a wealthy person, who is content to pay for his subsistence on the latter's bounty by cringing subservience and flattery.

Parasitic Animals, the term applied to those animals which depend to a greater or less degree on other animals for food, or lodgment, or for both. Some parasites are mere 'lodgers,' so to speak, and live within or upon other animals; whence they are called *Ectoparasites*—e.g., fleas, lice, bird lice, &c.—which infest the skin and outer tissues of their hosts. Parasites, in zoological language, *commensals* or 'messmates,' are represented by those fishes which inhabit the interior of the large tropical sea-anemones, in and out of whose bodies they swim freely. True parasitism, however, is when the parasite becomes dependent not merely for lodgment, but also for food, on its host. Examples of this state of things are furnished by the Tape-worm (q. v.), Fluke (q. v.), Trichinæ (q. v.), &c. Parasitism is an acquired condition. That it is so is proved by the fact that most parasites exhibit tendencies to live a free and independent existence during their young state.

Parasitic Diseases are so called from the fact that a great variety of diseases are caused by the presence of animals or of plants which live within or upon some tissue, organ, or surface of the body of man, or on other animals or plants. P. D. are classed under local diseases, and their subdivisions are *Entozoa* (Gr. *entos*, 'within,' and *zōon*, 'an animal'), *Ectozoa* (Gr. *ektos*, 'outside,' and *zōon*, 'an animal'), *Entophyte* (Gr. *entos*, 'within,' and *phytos*, 'a plant'), and *Epiphyta* (Gr. *epi*, 'upon,' and *phytos*, 'a plant').

Under the subdivision Entozoa, there are three classes—1. *Celmintha*, or hollow worms; that is, worms with an abdominal cavity. 2. *Sterelmintha*, or solid worms. 3. *Accidental parasites*; that is, internal parasites having the habits, but not referable to the class, of entozoa. Each of these classes includes numerous varieties, defined by the seat of the disease; as the intestines, kidneys, liver, blood, muscles, skin, eye, &c.

Under the subdivision Ectozoa there are the following varieties:—(1.) *Phthirus inguinalis*, the crab-louse. (2.) *Pediculus capitis*, the head-louse. (3.) *Pediculus palpebrarum*. (4.) *Pediculus vestimenti*, the body-louse. (5.) *Pediculus tabescentium*.

(6.) *Sarcoptes scabiei*, the itch insect. (7.) *Demodex folliculorum*. (8.) *Pulex penetrans*, the chigee, whose habitat is the skin and cellular tissue.

The subdivisions Entophyta and Epiphyta include the following varieties:—(1.) *Leptothrix buccalis*, or alga of the mouth. (2.) *Oidium albicans*, or thrush fungus; habitat, mouth in cases of thrush, and certain mucous cutaneous surfaces. (3.) *Sarcina ventriculi*; habitat, the stomach. (4.) *Torula cerevisiæ*, or the yeast-plant; habitat, the stomach, bladder, &c. (5.) *Chionyphe Carteri*, a cotton fungus occurring in the disease called mycetoma; habitat, deep tissues, and bones of the hands and feet. (6.) *Achorion Schönleini*; habitat, *tinea favosa*. (7.) *Puccinia javi*; habitat, *tinea favosa*. (8.) *Achorion Lebertii*; habitat, *tinea tonsurans*. (9.) *Microsporon Audouini*; habitat, *tinea decalvans*. (10.) *Trichophyton sporuloides*; habitat, *tinea polonica*. (11.) *Microsporon furfur*; habitat, *tinea versicolor*. (12.) *Microsporon mentagrophytes*; habitat, follicles of the hair in sycosis or mentagra.

The above, with some abridgment in the first of the four subdivisions, is the list of P. D. drawn up by a joint committee appointed by the Royal College of Physicians in 1869. The list, they say, might be extended by the addition of various parasitic vegetations which have been reported under the names of algæ, fungi, mycodermis, leptomiti, &c., but the characters or the existence of which are still the subject of inquiry. Since 1869, however, the field of inquiry has greatly widened, and several diseases of a widely different nature from those mentioned fall to be classed under P. D. The Germ Theory of Disease (q. v.), although still *sub judice*, claims to bring the specific fevers within the catalogue of P. D. It is highly probable that every animal and plant has its peculiar parasite, and there is undoubted evidence that P. D. may be transmitted by contagion from the inferior animals, and from plants to man. As a general rule, the ectozoa and the epiphyta do not attack those who are scrupulously clean; while the entozoa and the entophyta do not find a favourable nidus in those whose general health is otherwise good. The principal P. D. are described under their several names, as TAPE-WORM, TRICHINA, ITCH, &c.

Parasitic Plants we here limit to those plants that live upon other growing plants, termed their *host* or *bearer*, drawing nutrient substances from the tissues of the same. (For those that live upon animal organisms see ENTOPHYTES, and for such as make a resting-place merely of other plants, without penetrating their tissues and feeding on their juices, see EPIPHYTES.) Even in the P. P. thus limited there is much diversity, the highly organised being represented by the mistletoe and broomrape, whose roots enter and prey upon nutritive matter already to a certain extent assimilated; and the lower, by fungi in which the membrane of the cells of the host is pierced by the cells of the parasite, that the latter may live in and on them. The question has often been discussed whether P. P. are the causes or only the accompaniments of disease, and it has now been decided that the disease is contagious, and that healthy plants become victims to a particular disease when the spores of that special fungus that always occurs in connection with the said disease are sown upon them. Phanerogamic parasites are in general less injurious than Cryptogamic. P. P. may be divided into two classes—viz., those that have scales in place of leaves, and draw subsistence entirely from their bearer; and those that have leaves in which sap is elaborated under the influence of air and light. Orobanchaceæ and Dodder (q. v.) are examples of the first, and Mistletoe (q. v.) is a familiar representative of the last. See also RAFFLESIA. The term *saprophytes* is applied to such plants as appear to absorb their food-material from decaying organic substances. See MONOTROPACEÆ.

Parasnath (so called after the Jain demi-god or apostle, Parasnatha), a conspicuous hill in the district of Hazaribagh, Bengal, British India, about 170 miles N.W. of Calcutta. It is crowned by four glistening white Jain temples, which are maintained by the merchants of Murshedabad, and annually frequented by 10,000 pilgrims from all parts of India. During the years 1862-67 the spot was tried as a sanitarium for European troops, but has been rejected. On the slope is a tea garden, opened in 1877, and covering 14 square miles. See JAINS. Dr. Hooker's *Himalayan Journals* (Lond. 1854).

Parasol (Fr. *parasol*, Ital. *parasole*, from *parare*, 'to ward off,' and *sole*, 'the sun'), a small umbrella carried by ladies as a

shade from the sun's rays. Sunshades of larger dimensions than those of the present time are of great antiquity. The primitive civilised nations of the East regarded the P. as an emblem of royalty or high nobility, in the same way as the Umbrella (q. v.) is now used as a canopy of state among certain barbarous races. The P. was esteemed an article of luxury in ancient Greece and Rome, a lady always having a female slave in attendance carrying the shade. Coryat, the English traveller, mentions the use of the P. in Italy early in the 17th c., and probably it soon thereafter extended to France and England. It is supposed that the P. owes its origin to the practice of the Aryan nations carrying boughs at festivals; the Feast of Tabernacles affords an example of a similar Jewish custom. The symbolism of these shady boughs is obscure, but probably they had some connection with a sun-myth, and may have typified the death of the sun in the shades of night.

Parasu-Rama ('Rama with the axe') is the sixth incarnation or *avatar* of Vishnu, described in the *Bhagavata Purana*. In this character Vishnu undertook the complete extirpation of the Kshatriya or warrior caste, who were arrogating dominion over the Brahmins.

Parati, or **Paraty**, a thriving seaport of Brazil, situated on the Bay of Angra, at the mouth of the river of the same name, 90 miles S.W. of Rio de Janeiro. Pop. 10,000.

Parbuckle is a mode of drawing up or lowering down an inclined or vertical plane any cylindrical body, such as a barrel, cask, or gun, by means of a rope. The middle of the rope is passed round a post at the top of the plane, and its ends, after passing round the object, are retained in the hands of two men, who hoist or lower equally.

Parbutti (Párvatī= 'mountain-born'), a popular name in India for the goddess Kali (q. v.) or Durgah, the wife of Siva, who is the daughter of the Himalaya Mountains.

Par'cæ, the Latin Fates, answering to the Greek Moiræ and the Nornir of Northern Mythology (q. v.). The Moiræ (akin to *meros*, 'a part') are only once spoken of by Homer in the plural (*Il.* xxiv. 49), but in Hesiod we find the three daughters of Night—Clotho the spinner, Lachesis the apportioner, and Atropos the inevitable. Similarly the P. (*cf. pars*, 'a part') first became plural in the Augustan poets, who borrowed their conceptions of them from the Greeks, and represented them as aged crones. In art, on the other hand, the Fates are usually portrayed as grave maidens, Clotho bearing a spindle, Lachesis a staff pointing to a horoscope, and Atropos a pair of scales.

Par'ceners, in English law, are persons holding land jointly, and who may be compelled to make division. See COPARCENERY, and articles there referred to.

Par'chim, a town of Germany, grand duchy of Mecklenburg-Schwerin, on the Elde, 25 miles S.E. of Schwerin, has active industries in leather, soap, tobacco, brandy, &c. Pop. (1875) 8264.

Parch'ment (Fr. *parchemin*, originally *parcamin*; Prov. *pergamen*, from Lat. *pergamena*, found in St. Jerome, or *pergamina*, in Isidore of Seville), the name given to the skin of certain animals specially prepared for writing upon, and for other uses. The word is derived from Pergamos, the invention of the material having been ascribed to Eumenes II., King of Pergamos, at a time when the export of papyrus from Egypt was prohibited by Ptolemy Epiphanes. Herodotus, however, mentions that skins were in his time in common use for writing upon, and that the Ionians called books *diphtheria*, from their being written on skins; and it is therefore probable that the invention was only improved at Pergamos. Ordinary P. is made from sheep skins; vellum, which is a fine variety of P., is made from the skins of young calves, goats, or slink lambs, and also from split sheep skins. The skins, after being unhaird and dressed as for tanning, are stretched tightly in a wooden frame called a 'herse,' and carefully gone over with a fleshing tool to remove all fleshy and fatty matter. Afterwards, the whole surface is sifted over with fine lime, and carefully rubbed with pumice stone; it is then permitted to dry in the air, but still stretched in the herse. Drum heads are made of P. from calves skins, those of kettle-drums being of asses skin. Shagreen (q. v.) is a variety of P.

Parchment, Vegetable, is a modified form of paper produced by treating unsized paper, such as ordinary blotting-paper, with commercial oil of vitriol diluted with one-half its bulk of water. The paper is simply dipped into the acid, being left in it not more than a few seconds, and on being withdrawn, is thoroughly washed with clean water, and passed through a weak solution of ammonia to free it from all traces of the acid. The paper is found, by the action of the acid, to have undergone a very remarkable change; from being soft, bibulous, and easily torn, it is now firm and compact, with all the appearance and strength of good P. Like P., also, it softens and swells up in water, but it does not become elastic and extensible. It may be used for most of the purposes to which common P. is applied, but it is chiefly employed for covering jars of preserves, and for tying over the stoppers of bottles, &c.

Pardon. The power of P. is invested in the sovereign, and may be granted for all offences against the crown and the public. But the sovereign cannot grant P. for civil injuries. Neither can a P. from the crown avail against a parliamentary impeachment. A P. must be either under the Great Seal (q. v.) or by warrant under the royal Sign Manual (q. v.), countersigned by a principal Secretary of State. P. does not deprive an injured person of his right of indemnification.

Paré, Ambroise, a great French surgeon and the founder of modern surgery, was born at Laval, in department Mayenne, in 1517. He was apprenticed to a barber and surgeon in his native place; but his strong bias towards surgery and anatomy resulted in his leaving his master and going to Paris. Here he gained the good favour of Professor Goupil in the Collège de France; and in 1536 he accompanied the French army to Italy as master barber-surgeon. His skillful treatment of gunshot wounds secured his reputation; and on his return to Paris he was received with distinction by the Royal College of Chirurgery. In 1552 he was appointed surgeon to Henri II. He held the same responsible post under François II., Charles IX., and Henri III. Though a Protestant, he escaped the massacre of St. Bartholomew through the care of King Charles, who locked him into his own chamber. His works, published at intervals from 1545 to 1585, are all written in French, and roused much bitter feeling among his contemporaries, who deemed the science of medicine dishonoured by being written in the vulgar tongue. He himself treated these and other invidious attacks as they deserved—with silent contempt; and his usefulness ceased only with his life. He died at Paris, December 22, 1590. In 1840 a bronze statue, by the sculptor David (d'Angers), was erected to him in Laval. The last and best edition of his works, with a biography prefixed, is that by Malgaigne (3 vols. Paris, 1840).

Paregorio Elizir is the popular designation of *tinctura camphora composita*. It contains opium, benzoic acid, camphor, oil of anise, and proof spirit, there being in each drachm one-quarter grain of powder of opium. P. E. is given to allay spasmodic cough in bronchitis and phthisis, the dose being from 15 to 60 minims. *Scotch P.*, or *tinctura opii ammoniata*, is composed of opium, saffron, benzoic acid, oil of anise, strong solution of ammonia, and rectified spirit, the proportion of opium being 1 in 96 minims. The dose of Scotch P. is from $\frac{1}{2}$ to 1 drachm.

Paréira-Brava. See Cissampelos. The legitimate P.-B., however, is the root of a Brazilian plant called *Chondradendron tomentosum*, and that it has nothing whatever to do with Cissampelos is now an established fact.

Parathyria. See CELLULAR TISSUE.

Parent and Child. By 43 Eliz. c. 2, the father, mother, grandfather, and grandmother of poor children, incapacitated from working, are bound to provide them with necessaries at the rate of 20s. per month. The father alone has legal power over his children, and this he may exercise till they are twenty-one years of age. He is entitled to the custody of his children, and if they are taken from his custody the courts will grant a writ of *Habeas Corpus* to restore them; and will entertain actions of trespass brought by him against any party taking them away. He has a right to direct the education of his children, and, so long as they are under Age (q. v.), he may correct them in a reasonable manner; and his authority is supposed to be imparted to a schoolmaster or

tutor, who must, however, act temperately and not in anger. By an Act of 1873 the Chancery division may, on petition, order that a mother shall have access to her infant, or the court may order that the infant be delivered to the mother, and that it remain in her custody until it attain a certain age, not exceeding sixteen. A clause in a deed of separation between a father and a mother, providing that the father shall give up the control of an infant to the mother, will not invalidate the deed; but the court will not enforce the clause unless it consider that to do so will be for the benefit of the infant. Any parent wilfully neglecting to provide adequate food, clothing, lodging, or medical aid for his child under fourteen years of age, to the injury of its health, is liable, under 31 and 32 Vict. c. 122, to fine and imprisonment. The liability of a parent to maintain his or her child is limited to such maintenance as health and decency require, whatever be the circumstances of the parent. In England, a parent may by will deprive his child of any share in the parent's estate, real or personal, after his death. In Scotland this cannot be done as regards *movable* (Eng. personal) estate. See LEGITIM. As regards *heritable* (real) estate, see DEATHBED, LAW OF; PATRIA POTESTAS. Other important aspects of the relations between P. and C. are noticed under CHILDREN, LEGAL CAPACITY OF, and articles there referred to; also under BASTARDY and LEGITIMATION.

Parent's thesis (Gr. *para*, 'alongside of,' and *tithēmi*, 'I place'), an explanatory or supplementary clause interpolated in the midst of a sentence, which is grammatically complete without it. It is usually enclosed in curved lines (), but sometimes in dashes.

Pariah, properly *paraiyan*, from *Paria*, the Tamil name for the village drum, the beating of which is the special duty of the class so called in S. India. They are persons of no caste, or outcasts, who perform the meanest of offices. In the Presidency of Madras they have been ascertained by the census of 1871 to number 4,760,000 souls, or 15 per cent. of the total population, besides those who have adopted Christianity. They are only allowed to live on the outskirts of villages, and are the objects of hatred and contempt to all classes above them. The pariahs are a laborious, frugal, pleasure-loving people, and omnivorous in diet. Notwithstanding their common classification as outcasts they were entered in the census returns under 200 different subdivisions. Europeans have also applied the term to the P. dogs, the ownerless scavengers of the East.

Parian Chronicle. See ARUNDEL MARBLE.

Paridæ and Parus. See TIT.

Paring and Burning is a process locally employed in agriculture with the view of freeing the land from injurious weeds and from noxious insects and their larvæ. The process must not be confounded with the ordinary operation of burning as applied to stiff clay lands with the view of improving their mechanical condition. P. and B. is practised on old pasture and fodder lands, and sometimes after corn crops. The land is gone over with a 'paring' plough, which possesses a broad or paring share. It makes a broad shallow furrow, the portions sliced out of which are turned over on the neighbouring part of the ground, and thus alternate flat shallow depressions and elevations are secured. This process is termed 'raftering'. The remainder of the operations are thus described by a Cotswold farmer, in which neighbourhood the practice is general:—"After sufficient harrowing and rolling to reduce the crops to a moderate size, the light weedy part is raked together into small heaps at proper distances, the loose surface clod and fine earth is then pushed with the back of the rake in a ring round the bottom of each heap, which is then lighted with a wisp of straw before placed in the heap. After a little time all the cloddy ring of earth is spread evenly over the fire with an iron shovel and made firm, which stifles the fire and diffuses the heat through the whole mass. The ashes are subsequently evenly spread and ploughed up."

Paris is a small genus belonging to the tribe *Trillideæ* of the natural order *Liliaceæ*. It is well represented by *P. quadrifolia*, found in Europe and W. Asia, and occurring as a local woodland plant in Britain. This species has a white creeping rootstock, a round stem under a foot high, bearing (usually) four leaves, and surmounted by a solitary flower with green acuminate sepals and yellow petals, succeeded by a black berry-like fruit. The rootstock is purgative. The common name is Herb Paris, from

Its old Latin name of *Herba Paris*, 'herb of a pair,' in allusion to its quaternate leaf arrangement, though they really vary from three to eight.

Paris, the metropolis of France, and by far the most beautiful of the large cities of Europe, is situated on both banks of the Seine, about 110 miles from its mouth, and in the department of Seine, lat. 48° 50' N. and long. 2° 20' E. With only about half the inhabitants of London (Register General's District), it ranks conspicuously as the next largest and wealthiest city of Europe. As the centre of national interests, it exerts an influence over France that is almost absolute. Long the focus of European civilisation, it still stands alone among the cities of the world for the magnificence of its architectural monuments, the wealth of its literary, artistic, and scientific collections, and the elegance and gaiety of its fashionable circles. It is no less remarkable from a military point of view, defended as it is by the most extensive system of fortifications in existence. The greater part of the city occupies a hollow or level site, 200 feet above the sea, but in the N. rise the elevations of Montmartre and Belleville to a height of some 320 feet. The Seine divides the city into two unequal parts, the larger lying on the N. side. The *Ile-de-la-Cité*, in the Seine, is the oldest part, and around it the city extends in three great belts, marked by the inner and outer Boulevards (from Ger. *bolwerk*, Eng. *bulwark*), and by the present bastioned wall, beyond which the vicinity presents a rich, populous aspect, with its elegant villas and beautiful gardens. The longest diameter of the city is 7½ miles, the shortest 5½ miles. The entire area is 35 sq. miles. Among the well-known parts of P. are the Faubourg St. Germain, with its Legitimist aristocracy; the Faubourg St. Honoré, the residence of the diplomat and financier; the Quartier Latin, the students' rookery; and the Faubourg St. Antoine, the home of the artisan. A peculiarity of the street architecture of P. is the number of dwelling-houses six or seven stories high and of unusual size, inhabited by many different families, and under the care of a *concierge* or hall-porter. The enormous number of cafés in P. sufficiently indicates the great extent to which outdoor life prevails.

Bridges, Streets, &c.—Characteristic of P. are the magnificent embankments and bridges of the Seine. The Quais des Augustins and De la Mégisserie are as old as the 14th c., but the embankments to the extent of some 12 miles were constructed under the first and third Napoleon. The oldest of the bridges, of which there are 23, is Pont Notre Dame, erected in 1500. The Pont Neuf, begun in 1578 and completed in 1604 by Henri IV., is adorned with an equestrian statue of that monarch, and spans the river by 12 arches at the N. end of the *Ile-de-la-Cité*. The handsome Pont de la Concorde, built in 1787-90, is 160 yards long. The finest and most important streets of P. are the Boulevards, spacious macadamised thoroughfares, with broad asphalted pavements, adorned with trees, and containing seats, *Kiosques*, or news-stalls, and *Vespasiennes*, or pillars covered with advertisements. 'Les Grands Boulevards,' 3½ miles long, extend between the Place de la Bastille and the Madeleine, and are lined by continuous rows of brilliant shops, cafés, and restaurants, graduating from the luxurious Boulevard des Italiens in the W. to the humbler Boulevards St. Denis and Beaumarchais in the E. Other beautiful streets are the Rue Rivoli, famed for its splendid arcades, the Rue Montmartre, Rue de la Paix, Avenue de Vincennes, the beautiful Avenue des Champs Élysées (1 mile long), and the Rue St. Honoré.

Public Squares, Gardens, and Monuments.—The most famous square in P. is the Place de la Concorde, 390 by 235 yards, between the garden of the Tuileries and the Champs Élysées. Here, on the 21st of January 1793, was erected the terrible guillotine, among the 2800 victims of which were Louis XVI., Marie Antoinette, Philippe Egalité, Danton, and Robespierre. The famous Obélisque de Luxor, a present from Mehemet Ali to Louis Philippe, was erected on the site of the guillotine in 1836. It is a syenite monolith, 73 feet high, covered with hieroglyphics in praise of Sesostris. On either side of the obelisk are two beautiful fountains with basins 53 feet in diameter. The square is further ornamented by eight statues, representing the largest cities of France. The Jardin des Tuileries (780 yards by 347) contains fine old trees, and is adorned with numerous statues in marble and bronze. The Place du Carroussel, between the Tuileries and the Louvre, is celebrated for its Arc de

Triomphe, 47 feet high by 63 broad, erected by Napoleon I. in 1806. On the Place Vendôme, octagonal in shape, stands the famous Colonne Vendôme, erected, on the model of Trajan's column at Rome, by Napoleon I. in 1806-10. It is 144 feet high, and is covered with spiral reliefs representing scenes from the campaign of 1805. On the 15th May 1871 the column, as 'a monument of tyranny,' was pulled down by the Communists, but it was re-erected in 1875. The spacious Place de Bastille, where stood the celebrated state prison destroyed by the people 14th July 1789, is the site of a bronze Colonne de Juillet, 164 feet high, surmounted by a statue of Liberty. In the Place du Châtelet is the Fontaine de la Victoire, with its four allegorical figures, and the Colonne de Palmier, inscribed with the victories of Napoleon, and supporting a Victory by Bosio. The Porte St. Martin and Porte St. Denis, erected by Louis XIV., bear bas-reliefs of his victories in the Netherlands. To the W. of the Champs Élysées is the Arc de l'Étoile, the largest existing triumphal arch, 160 feet high by 146 broad, begun by Napoleon I. in 1806, and finished, after the design of Chalgrin, in 1836, at a cost of over £400,000. Rich in reliefs of Napoleonic victories by Rude, Lemaire, Cortot, Seurre, Marochetti, &c., it was considerably injured during the German bombardment of the city, but has been completely restored since 1875. From the Place de l'Étoile radiate twelve of the finest avenues and boulevards of P., and from the top of the arch is obtained probably the grandest view of the city. The Champs Élysées, a beautiful wooded park, intersected by avenues, was laid out in 1616 by Maria de' Medici, under the name of Cours de la Reine. Its principal avenue, leading from the Arc de Triomphe to the Place de la Concorde, is the Rotten Row of P., and is lined almost throughout by places of amusement. The adjoining Palais de l'Élysées, built in 1718, has been inhabited successively by the Marquise de Pompadour, Napoleon I. during the Hundred Days, the Duchesse de Berry, Napoleon III., and the President of the present Republic. The Avenue de l'Impératrice leads from the Arc de Triomphe to the beautiful Bois de Boulogne (see BOULOGNE). In the N. part of the Bois is the Jardin de Acclimatation, with an area of 50 acres. On the S. bank of the Seine is the Champ de Mars, a military esplanade, affording ground for the manoeuvres of 30,000 men. This was the scene of the Fête de la Fédération of 14th July 1790, and of the Exposition Universelle of 1867, and here is situated the Exposition to be opened in May 1878. Other places of recreation are the Parc de Montceaux, the Bois de Vincennes, and the gardens of the Palais Royale and of the Palais de Luxembourg.

Churches.—The city has 65 parish churches, and numerous chapels, the most celebrated religious edifice being the cathedral of Notre Dame, situated at the E. end of the Cité. A noble specimen of Gothic architecture, richly storied with rich, fantastic sculpture, it dates from between the 12th and 14th centuries, and is 139 yards long by 52 broad, and 110 feet high, with towers rising to 220 feet. The main vault rests on 131 columns, and the façade is singularly beautiful, with its ornate, deeply-recessed rose windows. Ste. Chapelle, also in the Cité, and splendidly decorated with bright chromatic materials, is probably the most exquisite medieval structure in existence. It was finished under St. Louis (1245-48), and designed to receive the various relics brought from the Holy Land. The Madeleine, near the Place de la Concorde, is in the style of the Parthenon, and was founded in 1764, but not finished till the reign of Napoleon I. The structure cost upwards of £590,000. It is 350 feet long by 147 broad, has splendid bronze gates by Triquetti, and is surrounded by 55 Corinthian columns 52 feet high. The interior is magnificently ornamented with statues, coloured marbles, frescoes, gildings, &c. S. of the Seine, the principal church is the Panthéon, built by Soufflot (1764-90) in the form of a Greek cross, which has a portico of 22 Corinthian columns, 65 feet high, and a dome with paintings by Gros. The crypt contains the sarcophagi of Rousseau, Voltaire, Mirabeau, &c. The oldest church in P. is probably St. Germain des Prés, dating from 1001-1163, the lower part of which is Romanesque, the upper part Gothic. The tomb of St. Geneviève, the patron saint of P., is in St. Etienne du Mont, begun in 1517. St. Germain l'Auxerrois, the old church of the French kings, dates from the 15th c. St. Eustache (1532-1637) has an excellent organ, and many fine frescoes and statues. La Trinité, one of the most beautiful churches in P., was finished in 1860 from designs by Balla, and has a tower 200 feet high, and

many fine pictures. St. Sulpice, begun in 1646, is celebrated for its pulpit and organ, and its frescoes by Delacroix, Vinchon, Guillemot, &c. Other notable churches are Notre Dame de Lorette (1823) with its gorgeous interior; St. Vincent de Paul (1824-44) the vault of which rests on 82 polished Ionic columns; and the beautiful St. Jean Baptiste (1858) in the Rue de Belleville, the highest part of the city. Of some 18 Protestant churches, perhaps the best-known is L'Oratoire.

Public Buildings, &c.—P. is singularly rich in grand public buildings, and especially in palaces. The palace of the Tuileries (q. v.), begun by Catherine de' Medici in 1564, extends at right angles to the Seine for 348 yards, with a breadth of 36 yards. It is now the W. front of a vast quadrangular structure, the most imposing palatial edifice in the world, the E. end of which is formed by the Louvre. This immense building covers an area of 24 acres. The Tuileries, the residence of the rulers of France since 1st February 1800, was in great part destroyed by the Communists, and still (1878) stands in blackened ruins. The Council General of the Seine adopted a resolution (19th February 1878) to raze the Tuileries, the only dissentient being M. Viollet le Duc, who urged that the palace might be restored for 460,000 francs, and appropriated to a museum for popular lectures. The Louvre is one of the most interesting buildings in the city. The original building was a fort built by Philippe Auguste (1180-1223), and transformed into a palace by Charles V. (1361-80). A new structure was raised by François I. in 1541; the gallery extending to the Louvre on the side of the Seine, 1540 feet long, was begun by Catherine de' Medici, and finished by Henri IV.; the main block, enlarged by Richelieu, received its eastern façade and celebrated colonnade from design by Perrault in 1665. The gallery on the side of the Rue Rivoli, now mostly taken up by government offices, was begun under Napoleon I. and finished by Napoleon III. at a cost of seventy-five million francs. The Louvre proper has long been occupied as an art museum, and is unrivalled for its collections of paintings and sculpture, and for its Egyptian, Greek, and Roman antiquities. It suffered somewhat by the conflagration of 1871, but has since been restored. The Pavillon de la Bibliothèque, on the N. side, was injured to a greater extent, though the library, containing 90,000 costly works, and many rare MSS., escaped almost entirely. The Palais Royal (q. v.) is an interesting historical pile, comprising a theatre and many brilliant shops and cafés. The Palais de Justice, in the Cité, was the residence of the French kings till the end of the 14th c., and is a vast building, partly as old as that date. The body of the building was completely restored 1839-69. It is the seat of the Cour de Cassation, Cour d'Appel, Cour d'Assises, Tribunal de Première Instance, and Tribunal de Simple Police. The Communists fired the building in 1871, and reduced part of it to ruins. The Palais de Luxembourg, on the S. side of the Seine, built for Maria de' Medici in 1615, in imitation of the Palazzo Pitti in Florence, was a royal residence down to the Revolution, when it was first used as a prison, and after 1795 as the Palais du Directoire, and Palais du Consulat. On the Restoration it became the Chambre des Pairs, and subsequently the Palais du Sénat. Many of its magnificent rooms are employed for exhibiting modern pictures, but at present the building is mainly occupied by the Seine prefecture, till the restoration of the Hôtel de Ville. Begun under François I., the latter building was entirely destroyed by the Communists, and is now (1878) in process of rapid reconstruction on the former design. The Palais du Corps Législatif, on the left bank of the Seine, contains a splendid Salle de la Paix, decorated by Horace Vernet, and a Salle du Trône, with paintings by Delacroix. The Hôtel des Invalides, built by Libéral Bruant, 1671-75, and inhabited at present (1878) by 3000 disabled soldiers, is an imposing pile, the Eglise of which is crowned by a gilded dome, 394 feet high, and visible for many miles from the city. Immediately beneath the dome stands the sarcophagus of Napoleon I., hewn from a huge block of Russian granite. Other notable buildings are the Bourse, a parallelogram in classical style, surrounded by a colonnade; the Mint, with a fine façade 395 feet long; and the Halles Centrales, an immense general market, with 3200 stands, covering an area of about 20 acres. In connection with the building of the Exposition of 1878, which is of a temporary character, a magnificent permanent structure, Le Trocadéro, to be used for art purposes, is now (March 1878) nearly completed.

Charities, Cemeteries, and Prisons.—No city is more amply

endowed than P. for benevolent purposes. La Salpêtrière, solely for 4500 indigent old women (some 1300 insane), is perhaps the largest asylum in the world, having an area of 78 acres. Bicêtre, an hospital for men, has 3600 beds. The Hôtel Dieu, the oldest hospital in Europe (founded 660), receives annually 13,000 patients. There are in all 17 general and special hospitals, among the better known being La Charité, La Pitié, La Riboisière, and Val de Grace. Les Creches, or public nurseries, 17 in number, provide during the day for the infants of working people at the rate of 20 centimes. In the Morgue (q. v.) the bodies found in the Seine are exposed for recognition. Of the cemeteries of P., Père-la-Chaise (see LA CHAISE) may be called, on account equally of the number of its famous dead, and of the cherished honour of interment within its precincts, the 'Westminster Abbey' of France. The southern half of the city is built over the limestone quarries which furnished the stone; and these quarries, having been made since 1786 the receptacle of the bones collected from the abolished intramural cemeteries, are the so-called catacombs. The principal prison of P. is La Force; the Nouveau Bicêtre is for convicts sentenced to life-long penal servitude; St. Pélagie, for political offenders; St. Lazare, for women exclusively; the Madelonnettes, for juvenile criminals; and Clichy, for debtors.

Schools, Museums, &c.—The Quartier Latin is still the great seat of the educational institutions. Here is the Sorbonne (q. v.), founded in 1250, with faculties of theology, letters and science, and a library of 140,000 vols. The Collège de France, founded by François I. in 1530, has 29 chairs, and in common with the Sorbonne allows free attendance at lectures. The Université de France grants degrees in connection with the Sorbonne. P. has a celebrated École de Médecine, École Militaire (with barracks for 5000 men and 1500 horses), École Centrale des Arts et Manufactures, Conservatoire des Arts et Métiers, École Polytechnique, École des Mines, and École des Ponts et Chaussées. All these institutions are more or less supported by the State, and render P. the chief seat of technical instruction in the world. The famous Academy, or Institut de France (q. v.), holds its meetings in the Palais de l'Institut, a circular building surmounted by a dome, situated on the left bank of the Seine. Close by is the Palais des Beaux Arts, a stately edifice (1820-28) used as an exhibition of art and industrial objects. The Jardin des Plantes covers an area of 30 hectares, and contains, besides a botanical garden, anatomical and zoological collections, &c. The Bibliothèque Nationale, probably the largest library in the world, is the repository of over 2,000,000 vols., 150,000 MSS., 300,000 maps and plans, 5000 portfolios of engravings, a cabinet of 200,000 medals, antiques, &c. Other important libraries are those of Ste. Geneviève (200,000 vols.), Mazarin (160,000), l'Arsenal (300,000), and de l'Institut (100,000). P. has 640 primary schools, 120 of which are conducted by ecclesiastical superintendents. Foremost among the museums of P. stands the Louvre, of which mention has already been made. The Hôtel de Cluny, a grand medieval structure, contains a valuable collection of relics bearing on the history of France. The Conservatoire des Arts et Métiers has a grand collection of machine models, and the Palais de l'Industrie, in the Champs Elysées, is now a permanent exhibition of Algerian and other products. The Musée d'Artillerie contains 4000 specimens of armour and weapons; the Musée Technologique, part of the Musée Municipal, comprises 10,000 tools and utensils. Besides the periodical art exhibitions, of which the chief is the annual Salon, there are in P. a vast number of private and public collections.

Places of Amusement.—The splendid new Opéra-house (opened 1875), was designed by Garnier and decorated by Baudry. It is one of the grandest buildings erected in P. within recent years, and has seats for 2350 persons. The Théâtre Français, founded in 1600, is the home of classical French drama, and receives from Government 240,000 francs yearly. The Odéon, near the Luxembourg, is the second classical theatre, and is greatly frequented by students. The Théâtre Italien is devoted to Italian opera, and the Opéra Comique to opera-bouffe. Other theatres are Le Gymnase, Le Vaudeville, Les Variétés, Les Bouffes-Parisiens, Le Palais Royal, L'Ambigu-Comique, Les Folies, La Porte St. Martin, &c. The Communists destroyed the beautiful Théâtre Lyrique, which has since been restored. The concerts of the Conservatoire de Musique have a European fame. Popular concerts are given in various music-halls and innumerable cafés-chantants. The chief equestrian shows are the Cirque d'Été, in

the Champs Elysées, with 6000 seats, and Cirque d'Hiver, on the Boulevard des Filles du Calvaire. The 'Soirées Musicales et Dançantes' are characteristic of Parisian life.

Newspapers.—The principal newspapers are—Conservative, Monarchical (Bonapartist, Orléanist, and Legitimist), *Le Figaro*, *Le Constitutionnel*, *Le Français*, *Le Gaulois*, *La Gazette de France*, *La Gazette des Tribunaux*, *Le Journal de P.*, *Le Monde*, *Le Moniteur*, *Le Soleil*, *Le Soir*, and the Ultramontane *Univers*;—Conservative-Republican, *Le Temps*, *Le Bien Public*, *Le Siècle*, *Le Journal des Débats*, *La Liberté*, *Le National*, and *Le XIX Siècle*;—Radical-Republican, *L'Opinion Nationale*, *L'Événement*, *Le Rappel*, and *La République Française*. The chief illustrated journals are *L'Illustration*, *L'Univers Illustré*, *Le Monde Illustré*, *Le Journal Amusant*, *Le Charivari*, *La Vie Parisienne*, and *Le Journal Pour Rire*. There are also many high-class periodicals and 'petits-journaux.'

Industries and Commerce.—Standing in the first rank as an industrial city, P. is mainly pre-eminent for the manufacture of articles of luxury, as jewellery, watches and clocks, mirrors, gloves, perfumery, artificial flowers, bonnets, millinery, and earrings. P. is the centre of the French glove industry. The shawls, tapestry, and carpets of P. are of superior kind, excelling especially in elegance of pattern and fineness of texture. The productions of the Gobelins (q. v.) are entirely manual, and are noted for their highly artistic qualities. Indeed, a singular union of technical skill and æsthetic design is remarkable in almost all 'Articles de P.,' and is partly due to the superior training of the Parisian artisan, partly to the encouragement of the State. The Government tobacco factory employs some 1900 hands, of whom 1400 are women. P. has shared with Rouen, since 1870, the exclusive right of making printed calicoes. The ceramic and pictorial arts are here carried to a high state of perfection, while the book-trade of France is almost confined to the metropolis. On Montmartre are extensive quarries of limestone, and gypsum, or plaster of P. P. has also a large export trade, chiefly in wine, brandy, sugar, silks, woollens, and haberdashery. It is the converging point of eight main railway lines, which are connected by a circular metropolitan line. A plan for the construction of underground railways, with the central terminus in the gardens of the Palais Royal, was approved by the Minister of Public Works in February 1878.

Municipal Statistics, &c.—The jurisdiction of the city is under the Prefect of the Seine, aided by 36 councillors. The drainage system is particularly noteworthy, and has principally contributed to make P. the healthiest city on the Continent. The yearly death rate, 36 per thousand under Louis XVI., has been reduced to 22-25 per 1000 in ordinary years. The vast water-works of P. are supplied by artesian wells, that of Grenelle yielding 200,000 gallons daily. Besides the Halles Centrales, already mentioned, there are many other *halles*, or wholesale, and *marchés*, or retail markets. The Halle aux Vins has storage for 500,000 casks. In 1876 the city budget amounted to £12,279,956, of which £390,600 was for educational purposes, £601,200 for maintenance of the poor, £285,800 for promenades and works of art, and the interest on the municipal debt £3,886,232. In 1877 the nominal debt of P. was £78,800,000 (augmented by a loan of £4,800,000 in 1876), and the amount is rapidly increasing. The pop. in 1877 was 1,988,806. The number of Protestants is estimated at 62,000, of Jews at 20,000, and of various sects at 30,000, the remainder being Roman Catholics. In 1874, 25·21 per cent. of the births were illegitimate.

Fortifications.—In consequence of recent events great interest attaches to the vast defences of the city. In 1840 Louis Philippe began the fortification of P. by the construction of ramparts, at a cost of £5,600,000. The *enceinte*, with its 94 bastions, is 21 miles long. The ramparts, 32 feet high, with a parapet 19 feet wide, are environed by a moat 48 feet wide. The approaches were formerly defended by 16 *Forts Detachés*, the chief being Mont Valérien, but most of these were destroyed in 1870-71, and several are to be reconstructed at a greater distance from the ramparts. Such was the strength of these works that the Germans only reduced the city in 1871 after a four months' blockade.

History.—In the *Commentaries* of Julius Cæsar P. is first mentioned as *Lutetia*, the 'mud-city' of the Parisii, a Gaelic tribe, subdued by the Romans. Destroyed by war, it was rebuilt by Cæsar, and became the *Urbs Vextigalis* of the province of Gallia. The ruins of the Palatium Thermarum (Palais de

Thermes), of ancient altars, aqueducts, &c., are found on both banks of the Seine. The name of the town was changed to *Civitas Parisiorum* or *Parisia* in 360 A.D. In 486 it was seized by the Franks, and Hlodwig (q. v.) made it the seat of the government in 508. Under the Karolings it suffered severely from the fierce raids of the Northmen (in 857 and 885); but in the 10th c. it became the capital of the modern monarchy of the Capets. By the 13th c. it had become one of the chief cities of Europe, and the seat of a famous university (see P., UNIVERSITY OF), with a population of 150,000. Among the early benefactors of the City, the most distinguished are Charles V., the founder of the Royal Library, the Bastille, and Palais de Tournelles; Louis XI., who repaired the disasters of the English occupation of 1421-22; François I., the patron of foreign artists, and founder of the Louvre and Hôtel de Ville; and Maria de' Medici and Henri IV., who inaugurated the improvements so widely extended by Louis XIV. During the reign of the latter, P. received 80 new streets, 33 churches, many monuments, &c., and the fortifications were converted into boulevards. The fair city witnessed the terrible days of the Revolution, and, as the heart of France, it contributed in no slight degree to the great outburst of national feeling. Napoleon I. expended four millions sterling in twelve years on the improvement of P., and dowered it with the treasures of art and science taken from conquered states. Louis Philippe expended 100,000,000 fr. in the construction of new streets, a vast drainage system, bridges, gardens, &c. But it may be said that Napoleon III., with the assistance of Baron Haussmann, virtually called the magnificent modern city into existence. The greatest event in the recent history of P., its siege by the Germans from 19th September 1870 to 28th January 1871, was followed by an infinitely more destructive outburst of Vandalism on the part of the Commune, the effects of which have already been traced in detail. The systematic attempt made by the Communists to fire with petroleum all the principal buildings, was only checked, after much irreparable damage, by the troops under Macmahon on the 25th of May. The cost of provisioning P. during the war was 38,807,000 fr. See Corrozet, *Les Antiquités, Chroniques et Singularités de P.* (1586); Dubreul, *Le Théâtre des Antiquités de P.* (1612); Félibien, *Histoire de P.* (5 vols. 1725); Lebeuf, *Histoire de la Ville et de tout le Diocèse de P.* (15 vols. 1754-58); Dulaure, *Histoire Physique, Civile, et Morale de P.* (7 vols. 1820-22); Lavallée, *Histoire de P.* (2 vols. 1857); Labédollière, *Le Nouveau P.* (1860); Joanne, *P. Illustré en 1870* (1871); Moriac, *P. sous la Commune* (1871); and Haussmann, *Histoire Générale de P.* (4to, vol. vii. 1871).

Paris, The University of, like its English sisters, had no authenticated record of its foundation. Remigius of Auxerre is said to have lectured at Paris about the year 900, and Stephen Harding, founder of the Cistercians, was studying there in 1070. But a continuous succession of teachers can hardly be traced beyond the opening years of the 12th c., when William of Champeaux and Abelard, the expounders of the Nominalist and Realist philosophies, drew to their lectures scholars from every part of Christendom, Beket, John of Salisbury, and Peter Lombard amongst the number. Suddenly Paris became the centre of medieval teaching, the 'fountain of knowledge and tree of life,' the arbiter to whose decision Henry II. referred his conflict with the Church. Thenceforth *Nos fuimus in Galandia* (in the Rue de Galande of the Quartier Latin) was a password with the youth of Europe. In 1200 Philippe Auguste granted the university its earliest charter, according it immunity from taxation and a jurisdiction of its own, and fifteen years later its statutes were drawn up by the Englishman Robert de Courson. Four 'nations' composed the university—the honourable nation of France, the most faithful nation of Picardy, the venerable nation of Normandy, and the most steadfast nation of England, the last replaced under Charles VI. by Germany. These four nations, with their four procurators, formed the Faculty of Arts, embracing the *trivium* (grammar, rhetoric, and dialectic) and *quadrivium* (arithmetic, geometry, astronomy, and music), and they had the right of electing the rector of the university. To the faculty of arts were added the faculties of theology (1257), law (1271), and medicine (1274), each with their separate dean. The Chancellor of Notre Dame, the university's ecclesiastical superior, alone conferred the licence to teach, a licence which the Mendicant Orders obtained with difficulty in 1257,

when the Dominican Aquinas and Franciscan Bonaventura were admitted doctors of theology. Scholastic theology was the loadstone that attracted Edmund Rich, Roger Bacon, Duns Scotus, Dante, Ockham, Bradwardin, and a crowd of students outnumbering the very citizens. It 'moralised' the grammars of Priscian and Donatus, and reduced the science of music to a smattering of plain-song. At the head of the colleges that began to arise in the 13th c. stood the theological college of the Sorbonne (1253), the later opponent of the Reformers and Jansenists; and Crevier enumerates fifteen others founded in the next hundred years, of which the Collège de Montaigu (1314) was to become the training-place of Erasmus, Rabelais, and Ignatius Loyola. Slowly philology and other sciences crept into the curriculum. The natural philosophy and metaphysics of Aristotle were interdicted up to 1237; mathematics, long identified with magic, were in 1290 represented by a solitary treatise on geometry in the library catalogue of the Sorbonne, where too we find a copy of Ovid, of all the Latin authors. Fifty years later the library had Horace, Virgil, Lucan, Juvenal, &c. But while theology declined, the university increased, its scholars numbering 25,000 at the death of Charles VII. (1453), and 30,000 in the student days of Scaliger. Philippe le Long consulted it on the interpretation of the Salic Law (1317); and in the great schism of the West the rival Popes appealed to its decision, Gerson, its chancellor, being the soul of the council of Pisa (1409). Greek was studied in Paris earlier than in the Italian universities, and it was there that Reuchlin acquired its rudiments from the native Greeks Tifernas and Hermonymus (1470-72). In 1507 Giles Gourmont established at Paris the first Greek press on this side the Alps; and under François I., himself a liberal patron of learning, and founder of the Collège de France, Paris could boast the profoundest Greek scholar in Europe, Budæus. At the Reformation the university, though it had constantly asserted the Gallican liberties, and though Luther called on it to arbitrate between him and Rome, never wavered in its allegiance to the Catholic faith. The conservative spirit evinced in its condemnation of Ramus' Calvinistic and anti-Aristotelian doctrines (1543) was ridiculed by Boileau a century later in his famous *Arrêt Burlesque*. The university flung itself fiercely into the struggles of the League, and through the dissensions of the Dominicans, Franciscans, and Jesuits (which last had gained admission in 1565) lost much not only of its political but scholastic influence. The despotism of Richelieu and Louis XIV. stripped it of the last vestiges of power, and Rollin's is almost the only eminent name among its teachers in the 17th and 18th centuries. The funds derived from the post-office and messageries were withdrawn before the year 1720, and were poorly compensated by a yearly grant of 150,000 livres. The expulsion of the Jesuits (1764) was followed at the Revolution by a decree of the Convention (March 20, 1794) suppressing the U. of P., along with the twenty universities of the provinces. To fill their place Napoleon I. established (March 17, 1808) the University of France, and vested in the State a monopoly of education, which, warmly contested by the clergy in the name of liberty, has been partially broken through by the National Assemblies of 1850 and 1875. See Duhamel, *Histoire de l'Université de Paris* (2 vols. Par. 1829); Jourdain, *Histoire de l'Université de Paris aux XVIIe et XVIIIe Siècles* (Par. 1864); Hallam, *Literature of Europe* (4 vols. Lond. 1837-39); and M. Arnold, *Schools and Universities on the Continent* (Lond. 1868).

Paris, in the Greek myth, was second son of Priam, king of Ilium, and Hecuba. His mother having dreamed that she brought forth a firebrand, the child was delivered to a shepherd to expose on the slopes of Ida. Here a she-bear suckled him for five days, when the shepherd, finding him still alive, carried him home, and reared him as his own son. He grew up strong and comely, and by his prowess in defence of his foster-father's flocks gained the name of Alexander ('warder of men'). At the funeral games held to commemorate his fancied death, his true parentage was revealed by Cassandra and acknowledged by Priam, shortly after which P. wedded Cœnone, the daughter of the river-god Cebren. Hera, Athene, and Aphrodite called on him to award to the fairest of the three the apple of discord, the first offering him power, the second wisdom, and Aphrodite the loveliest woman on earth. He chose the last, and was aided by the goddess in his rape of Helen, false wife to Menelaus,

king of Sparta. In the ten years' siege of Troy that followed on his treachery, P. did little save basely slay Achilles, and was at last himself wounded by one of the poisoned arrows of Heracles. Once more on Ida he sought Cœnone, knowing her skill in leechcraft, but she would not or could not heal him, though she gladly shared his death. Comparative mythologists identify P. with the Vedic Panis, who rob the cow-clouds of the dawn (Sarama or Helene), and Achilles, who dies at the western gate of Troy, with Aharyus, the sun; and find in the Iliad 'the old story of the victory and death of the solar hero around the walls and battlements of the sky'—Sayce, *Comparative Philology* (Lond. 1874).

Paris, Louis Philippe Albert d'Orléans, Comte de, grandson of Louis Philippe, late king of France, was born at Paris, August 27, 1838. After the Revolution of 1848 he crossed with his mother to England, and in 1861 to America, under surveillance of the Prince de Joinville. He then served for several months along with his brother, the Duc de Chartres, on the staff of General McClellan of the Federal army, returning to Europe after the conclusion of the campaign in Virginia. P. married the eldest daughter of the Duc de Montpensier, May 30, 1864. In 1867 he published *Allemagne Nouvelle*, in 1869 *Les Associations Ouvrières en Angleterre*, and in 1870 *L'Esprit de Conquête*, which show an unusual watchfulness of the less obvious currents of social life. After the fall of Napoleon III., P. became (1871) a member of the National Assembly. In 1874 he published a *Histoire de la Guerre Civile en l'Amérique*, which added considerably to his reputation as a conscientious writer. P. is a man of retiring disposition, truthful and straightforward in all his dealings. His party in the French Assembly is represented by the members of the Right Centre, but since his acknowledgment of the Comte de Chambord as the head of the royal house of France (1871), its constitutional aims have been urged neither with independence nor vigour.

Paris, Matthew. See MATTHEW PARIS.

Paris Basin, in geology, is the name given to the middle Eocene (q. v.) formations which rest in the hollow of the Paris Chalk. It is the *Calcaire Grossier* of the French geologists, and is remarkable for its rich fossil contents. Molluscs, fish, crocodiles, birds, quadrupeds, and palms and other plants are represented. From these relics of a past age Cuvier and Brongniart laid the foundation of palæontological geology.

Parish (from the Old Fr. *paroche*, Lat. *parœcia*; in St. Augustine 'a diocese,' in Sidonius Apollinaris 'a parish'; Gr. *paroikia*, 'a dwelling together'). The early use of the word proves that it denotes sometimes the Diocese (q. v.) of a bishop, and sometimes the district assigned to a particular church. Now, however, it strictly signifies the territorial bounds connected with a particular church of the established religion, and for the support of which alone the tithes within those bounds can be allocated. The subdivision is made also by the law with the object of local self-government, and administration of the Poor Laws (q. v.). The 6 and 7 Vict. c. 37, and 7 and 8 Vict. c. 94, afford facilities for the subdivision of populous districts, and for the formation out of these of separate parishes, for the augmentation of poor livings, and for ecclesiastical purposes generally. By these Acts, the Ecclesiastical Commissioners are empowered to borrow £600,000 from the governors of Queen Anne's Bounty, on the security of the property accruing under the Cathedral Acts, to form districts for spiritual purposes in populous parishes, with consent of the bishop of the diocese. These are to be permanently endowed with not less than £100 a year, to be increased to £150 upon the district becoming a new P. The scheme for the formation of such district is to be submitted to Her Majesty in Council, previous notice of it having been given to the patron and to the incumbent of the P., and a clergyman is then to be nominated, to be licensed by the bishop. The nominee is to hold his office in the same manner as a perpetual curate, and in that capacity he may receive any grant or endowment, notwithstanding the statutes of mortmain. See MORTMAIN, STATUTES OF.

A *Vestry* is a place adjoining the church, where the vestments of the clergyman are kept. The word also denotes the meeting held in the vestry by the parishioners to consult on the affairs of the church or P. By custom, as well as by statute, there may be *select vestries*, that is, a certain number of parishioners

chosen to carry on the local government of the P., to make its rates, and to audit the accounts of the Churchwardens (q. v.). Every parishioner who has paid his rate can vote at a vestry, and all questions are decided by a majority of votes. Every inhabitant whose poor assessment is less than £50 is entitled to one vote; amounting to £50 or upwards, he is entitled to an additional vote for every £25 above that sum; but no one is entitled to more than six votes. 23 and 24 Vict. c. 30 is to facilitate local improvements for the health and comfort of parishes. In any P. whose population by last census exceeds 500, the ratepayers may hold land, or purchase or accept gifts of it, to form a public walk, exercise, or playground, or for the purpose of improving the same. 22 Vict. c. 27 grants facilities for the conveyance of lands to trustees 'for the resort and recreation of adults, and of playgrounds for children and youth.' The P. Clerk (q. v.) and Sexton (q. v.) are officers of the church. They are all usually appointed by the incumbent, but by custom may be chosen by the parishioners. A P. clerk may be suspended or removed by the archdeacon, or other ordinary, for misconduct or negligence. Every P. is bound to keep the highways passing through it in repair, unless this duty be otherwise imposed. For this purpose, surveyors are annually elected by the parishioners. They are bound to erect direction-posts at cross roads, with distinct inscriptions. See HIGHWAY.

When disputes regarding the boundaries of parishes give rise to litigation, the question is decided by proof of custom; hence the habit of *perambulation of parishes*; which is a going over and survey of the boundaries of a P. by the minister, churchwardens, and some other parishioners once a year, in or about Ascension Week. The perambulators may go over any man's land, according to usage; and, it is said, may remove all nuisances in their progress (see BOUND, or BOUNDARY). A statute of 1857 gives power to justices and poor-law boards (but see POOR-LAWS) to annex extra-parochial places, such as forest lands, to parishes. Incumbents of P. churches, who are styled rectors, vicars, or perpetual curates, are bound to reside in their P., and to administer the rights of the Church to parishioners (see NON-RESIDENCE). In Scotland, the judges of the Court of Session are empowered, with the consent of the majority in value of the Heritors (q. v.), to unite two or more parishes into one, or to divide a P.; and by 7 and 8 Vict. c. 44, any district may be erected into a P. for ecclesiastical purposes, or *quoad sacra*, as it is called, where there is an endowed church; and the Board of Supervision may combine two or more parishes for poor-law purposes. Regarding the law affecting parochial education in England and in Scotland, see EDUCATION.

Parish Clerk. This church officer, whose duty is to lead the responses during the reading of the service, must be twenty years old, and commonly holds his office *aut vita aut culpa*; but in some of the new churches built under the Church Building Acts he is appointed annually by the incumbent. His salary is payable from the church rates. See PARISH.

Parish Registers are books kept in each parish in England for the registration of baptisms, funerals, and marriages. They were instituted in 13 Henry VIII. The registration is now regulated by 6 and 7 Will. IV. c. 86. The P. R. is open to the inspection of all, on proper cause being shown; but the rector or curate cannot be required to make extracts.

Parish School. See PUBLIC SCHOOL.

Park, Mungo, a famous African traveller, was born at Fowlshiels, in the county of Selkirk, Scotland, 10th September 1771. The son of a respectable farmer, he received a good education, and was apprenticed at the age of fifteen to Mr. Thomas Anderson, surgeon at Selkirk, in accordance with his own desires. In 1789 he proceeded to Edinburgh University, where he took a three years' course in medicine, devoting himself chiefly to the study of natural history and botany. He then went to London, where, through the influence of Sir Joseph Banks, he was appointed assistant-surgeon to the East Indian *Worcester*, in which he made a voyage to Sumatra. On his return he was chosen by the London African Association to take charge of an exploring expedition to the River Niger, in place of Major Houghton, who had lately died in Africa. On the 22d of May 1795 he sailed from Portsmouth on board the *Endeavour*, and arrived in Gambia on the 24th of June. From this point he penetrated

1100 miles directly eastward, crossing the Niger at Sego and reaching Silla, where, however, he was forced to retrace his steps. During this journey he investigated the sources of the Senegal, Gambia, and Niger, ascertained the boundaries of the Moorish and Negro territories, and fixed a number of geographical positions. He arrived at Falmouth 22d December 1797, after an absence from England of two years and a half. Here he occupied himself in writing an account of his travels, which was published in 1799, and quickly obtained great popularity. P. now married, and settled for some time as a surgeon at Peebles. In 1804 he again took command of an expedition to the Niger, this time under Government patronage, and sailed from Portsmouth on the 30th January. On the 28th March he arrived at Goree, on the W. African coast, and engaged forty-four soldiers to attend him in his journey across the country. Long before he reached the Niger, however, the rainy season came on, and thirty-five of his men perished. Undaunted by calamity, P. built a boat, and set sail down the river. After a long time had elapsed, intelligence was brought by one of his native attendants, Amadi Fatouma, that P. and his companions had been attacked by a hostile tribe, that the boat had been overturned in a rapid, and that all the white men were drowned (towards the end of 1805). P.'s great work is entitled *Travels in the Interior Districts of Africa, 1795-97, by Mungo P., with an Appendix containing Geographical Illustrations of Africa by Major Rennell* (4to, Lond. 1799). His journal and correspondence were published in 1815, with a life prefixed by Mr. Wishaw. A monument was erected to his memory at Selkirk in 1859.

Parke, John, an English musician, born in 1745, died in 1829, was celebrated as the best oboe player of his time. His brother, William Thomas P., was an eminent performer on the same instrument.

Parker, a name celebrated in the naval annals of both England and America.—**Sir Hyde P.**, Vice-Admiral of the Blue, belonged to a Devonshire family, from whom the Earls of Morley also are descended. He commanded against the Dutch in a gallant but indecisive action off the Dogger Bank, August 5, 1781, and two years afterwards was lost in the *Cato*, which had last touched at Rio Janeiro. His second son, **Sir Hyde P.**, was born in 1739, and died Admiral of the White, March 16, 1807.—To a Kentish family belonged **Vice-Admiral Sir William P.**, who received a baronetcy for his services against the French, June 24, 1797, and died October 31, 1802; and whose son, **Sir William George P.** (born August 10, 1787, died March 24, 1848), was also Vice-Admiral of the White.—**Sir William P.**, a grandson of Lord Chief-Baron Thomas P., and a kinsman of the Earls of Macclesfield, was born in 1781, rose to be captain (1801), and captured the citadel of Ferrol (1809). He served with distinction in the first Chinese war (1841), was created baronet (1844), blockaded the Greek ports (1851), and died Rear-Admiral of the United Kingdom, November 13, 1866.—Two other English admirals of the same name were **Sir Peter P.** (born 1716, died December 21, 1811), and his nephew, **Sir George P.** (born 1766, died December 24, 1847).—**Foxhall P.**, born in New York, August 5, 1821, entered the U.S. navy (1837), and after serving against the Indians of Florida, on the Coast Survey, and in the Mediterranean, obtained his lieutenantcy (1850). In the Civil War he commanded the Potomac flotilla, was promoted captain (1866), and in 1872 became chief signal officer of the navy, a post which he still (1788) retains. He has written *Fleet Tactics* (1863); *The Naval Howitzer Afloat* (1865); and *The Naval Howitzer Ashore* (1866); was long a contributor to the *Knickerbocker Magazine*, and was one of the founders of the Naval Institute at Annapolis (1873).

Parker, John Henry, O.B., F.S.A., son of a London merchant, was born in 1806. After being educated at Dr. Haines' school, Chiswick, he entered the book trade in 1821, and in 1832 succeeded to the business of his uncle, Mr. Joseph P., at Oxford. He has devoted himself chiefly to the study of architecture, on which subject he has published some important works. In 1869 he was appointed by the University of Oxford keeper of the Ashmolean Museum, with a salary of £350, further supplemented by a grant of £200, to assist him in prosecuting the excavations which are (1878) being carried out at Rome under his superintendence. He has also been created an honorary M.A. of Oxford. His principal works are *Glossary of Architect.*

ture (3 vols. 1836); *Introduction to the Study of Gothic Architecture* (1849); *Domestic Architecture of the Middle Ages* (3 vols. 1853-59); *Archæology of Rome* (Parts i.-xi., 1874-77).

Parker, Matthew, son of a calenderer, was born at Norwich, 6th August 1504, educated at Corpus Christi College, Cambridge, where he applied himself with zeal to the study of ecclesiastical history and scripture, and admitted to the priesthood in 1527. In 1533 he became chaplain to Anne Boleyn; two years later he was appointed Dean of the Catholic College of Stoke Clare in Suffolk; in 1538 he was inscribed D.D.; in 1537 he became chaplain to Henry VIII.; in 1544 he was made master of Benet College, Cambridge; in 1547 he married. The last step was the culmination of convictions long developing, whereby he broke with Catholicism and passed over to the side of the Protestant Reformation. Under Edward VI. he became Canon of Covingham, but was careful to conceal himself during the reign of Mary, a period which he utilised in the elaboration of his already composed treatise *De Conjugio Sacerdotum*, and in making a rhythmical translation of the Psalms. Queen Elizabeth recalled him from obscurity to the Archbishopric of Canterbury, December 17, 1559. Though thoroughly imbued with the Reformation spirit, P. resisted the extreme forms of Protestantism as much as he curbed the reactionary tendencies of the clergy who were still Catholic at heart. His chief aim was directed towards the re-establishment of discipline and the observance of conformity in worship, and to this end he presided over a commission which sat at Lambeth, and administered to non-conformity many severe chastisements. Nor was his relationship to the Queen an easy one, for she never forgave him his matrimonial connection, and once rebuked Mrs. P., who had received her generously, with the speech, 'Madam I may not call you, and mistress I am loth to call you; however, I thank you for your good cheer.' In 1568 P. published at his own expense the *Bishops' Bible*, and in 1572 the *De Antiquitate Britannicæ Ecclesiæ*, while to his generosity Corpus Christi College owed a substantial endowment in money, and a valuable gift of ancient manuscripts reaching over nine centuries. He died 17th May 1575. P. was one of the first to revive the study of Old English literature, and besides editing Matthew Paris and Matthew of Westminster, he originated the 'Society of Antiquaries.' He was a man of great moderation of character, but circumstances developed in him a firmness and resolution which sometimes amounted to harshness. See *Strype's Life of Archbishop P.* (3 vols. Oxf. Clar. Press, 1711), and vol. ix. of *Hook's Lives of the Archbishops of Canterbury* (Lond. 1872). The 'P. Society,' named in his honour, published (1841-55) a series of 55 vols. of English ecclesiastical writings of the Elizabethan age.

Parker, Theodore, was born near Lexington, Massachusetts, U.S., 24th August 1810. From childhood he was a laborious student, and from early boyhood 'felt he was to be a minister.' In 1837 he was ordained to the Unitarian Church of West Roxbury, near Boston, and soon became distinguished for the free expression he gave to the freedom of thought he had always sought. A crisis was reached in 1841, when he preached a 'Discourse of the Transient and Permanent in Christianity.' He was in consequence ostracised by both Trinitarian and Unitarian ministers. In 1843-44, P. travelled for a year in Europe, and on his return home became (February 1845) pastor of the 28th Congregational Society, which he served till January 1859, when he burst a blood-vessel in his lungs. He died at Florence, 10th May 1860. His library of 13,000 vols. he bequeathed to the Boston Free Library. P.'s great natural gifts and daring originality of thought were balanced with varied and profound learning. But he was even more distinguished for an intense warmth of heart, exhibited in a womanly devotion to his friends and an immense power of human sympathy, which led him to make almost superhuman exertions for every philanthropic object, and notably in behalf of the slaves. The chief published writings of P., besides a number of sermons, and critical and miscellaneous pieces, are *Discourses of Religion, of Theology, of Politics, of Social Science, and of Slavery*. He is generally regarded as the great modern apostle of Theism; but it has also been pointed out that his theology is a form of spiritual Pantheism. A complete edition of P.'s works by F. P. Obbe was published at London in 12 vols. 1863-67, and by H. B. Fuller in 10 vols. Boston, 1870. There are biographies of P. by the Rev. J. Weiss (2 vols. New York, 1864); Réville (*PAR.* 1865); the Rev. O. B. Frothing-

ham (New York, 1874); and P. Dean (Lond. 1877). See also Hunt's *Essay on Pantheism* (Lond. 1866).

Parkeria, a genus of *Foraminifera* (q. v.), found in a fossil state in the Upper Green Sand of the Chalk series. It is interesting from its large relative size, a diameter of two inches being common. Its shell was arenaceous, that is, it contained sandy particles as elements in its formation.

Parkesine (named after the inventor, Mr. A. Parkes of Birmingham), a factitious material, fluid, plastic, or perfectly hard, procured originally from a solution of gun-cotton, and afterwards from cotton, tow, and similar waste substances, by an undivulged process. As it resists the action of the atmosphere or acids, it was proposed to employ P. as a substitute for gutta-percha in its various applications in telegraphy and otherwise, and for ebonite in making combs, knife-handles, &c., but it has never come into commercial competition with either of these substances.

Parkhurst, John, a biblical scholar, born at Catesby, Northamptonshire, in June 1728, was educated at Rugby and Cambridge, where he obtained a fellowship and took the degree of M.A. in 1752. He studied for the Church and entered holy orders, but on inheriting his father's large fortune, retired to his private estate in Surrey, where he devoted himself to his favourite pursuit of biblical philology. He died there 21st March 1797. His principal works, which have now, however, quite fallen into disuse, are *A Hebrew and English Lexicon without Points* (1762), *A Greek and English Lexicon to the New Testament* (1769).

Parkinsonia is a small genus of the *Casalpinia*, sub-order of *Leguminosæ*, consisting of spiny shrubs or small trees with bipinnate leaves. *P. aculeata*, indigenous in the W. Indies and tropical America, is now cultivated in most tropical countries, and has become almost naturalised in India, where it is grown as a hedge plant, both for ornament and service. The wood is whitish, light, and soft, but is close grained, and polishes fairly. In Mexico the Indians use it as a febrifuge and sordorific, also as a remedy in epilepsy. The name commemorates John Parkinson, a good English botanist of the early part of the 17th c.

Park of Artillery, the military term for the *matériel* used by artillery forces in war, and everything appertaining thereto. The park is placed in a central and convenient position in the field. See ARTILLERY.

Parks, in law. See FORESTS, CHASES, WARRENS, and PARKS.

Parliament, the highest legislative body of the United Kingdom, is composed of the sovereign, the House of Lords, and the House of Commons. A national assembly of some kind is as old as English history, though its composition and powers have varied at different epochs. From the description given of the Germans by Tacitus it has been judged that in his time their political system was that of a free commonwealth of warriors, every freeman having a place in the state and a vote for the council, hereditary descent and elective office being held in high esteem. While England was still a cluster of separate states, the assembly of each was called the *witenagemot* ('meeting of the wise'), at which every ordinary freeman had the right of attendance and vote. It gradually ceased, however, to be representative, since men of means could alone afford to obey the summons to it. It was never very largely attended; a *witenagemot* of Eadgar's, for example, held A.D. 996, contained his mother, two archbishops, seven bishops, five ealdormen, and fifteen ministri. The legislative authority of the *witan* was complete and binding and extended to ecclesiastical as well as secular affairs. It busied itself with transfers of land, revived monastic charters of confirmation, and acted in the last resort as a court of justice. It imposed extraordinary taxation, and had a consultative voice in the determination of peace or war. Above all, in theory it elected the king, though 'the rule of hereditary succession was never, except in great emergencies and in the most trying times, set aside.' By the time of the Norman Conquest, the constitution of the *witenagemot* had become fluctuating and anomalous, and though it retained much of its earliest character under the Conqueror, it was less of a free gathering than a royal court of feudal vassals. Representation was based upon land tenure, which consequently excluded freeholders in general. It now took the name of Great Council, but it was a council of courtiers—bishops, abbots, earls, barons

and knights—who held their lands from the king, and was chiefly valuable as upholding the theory and form of a national assembly. 'The number of persons,' writes Mr. Stubbs, 'who were really consulted on business, or to whom the share of such attention was paid, must have been always very limited.' Once or twice leading men from London and Yorkshire were summoned to deliberate. Though there was little initiative in the council, their legislative authority was to a certain extent admitted. Judicial sentences, too, were passed, and matters of civil jurisdiction were discussed; but there is no trace of the power to join in taxation. Under the head of 'general business,' earldoms and knight-hoods were conferred, homage to the king was witnessed, questions of foreign and ecclesiastical policy, of war and peace were considered, and royal marriages talked over. The Conqueror held his council at Winchester, Westminster, and Gloucester; under Henry I. they were held at the forest palaces and in different midland towns as well. But it was not till the reign of Henry II. that they were summoned with regularity and their functions enlarged to the discussion of taxation. 'The name,' says Mr. Stubbs, 'given to these sessions of council was often expressed by the Latin *colloquium*; and it is by no means unlikely that the name of P., which is used as early as 1175 by Jordan Fantosme, may have been in common use.' The power of taxation was definitely fixed when it was announced in the Great Charter that no burthens beyond the customary feudal aids might be imposed 'save by the Common Council of the realm.' Up to this time though the assembly in theory included 'lesser barons,' who were knights and freeholders holding in chief of the crown, they but seldom attended owing to the personal expense it involved. It was enacted in an extraordinary provision of the Great Charter that whilst the greater barons were to be summoned personally, a general writ should call together the lesser barons. 'Here,' says Mr. Freeman, 'we have the beginning of our county members, and of the title which they still bear of knights of the shire. Here is the beginning of popular representation, as distinct from the gathering of the people in their own person.' The year 1265 marks an important epoch in the history of the English assembly. Simon de Montfort (q. v.), who was then master of the kingdom with Henry III. in his keeping, summoned a P. for the 20th of January, in which provision was for the first time made for the representation of the shires, cities, and boroughs. Two knights from every county, two citizens from every city, and two burgesses from every borough were called for consultation at Westminster. 'Then,' says Mr. Freeman, 'was formed that newly developed Estate of the Realm which was, step by step, to grow into the most powerful of all, the Commons' House of P.' Representation was not, however, coveted by the classes in question, so that thirty years elapsed before the Great Council passed into the P. of the realm. On the 27th November 1295, there met at the request of Edward I. a P. which he intended to be a model assembly, 'bearing in its constitution evidence of the principle by which the summons was dictated, and serving as a pattern for all future assemblies of the nation.' By his summons to the burgesses and knights of the shire P. was constructed to represent three bodies, the clergy, the baronage, and the commons.

Each order of the state was now represented, and shared in legislation, control of government, and grant of supplies. At the same time Westminster was fixed upon as the permanent seat of the assembly. But though Edward I. concentrated the three estates of his people, it is not until the opening of the reign of Edward III. that the division into a House of Lords and House of Commons becomes apparent. The House of Lords is simply the witenagemot and the great council, 'by the force of circumstances, step by step, without any one moment of sudden change, shrunk up into an assembly wholly hereditary and official.' The third estate, by the union of the knights of the shire with the burgesses, got marked off as 'the Commons.' During the 15th c. P. once more ceased to represent the nation, for though the House of Commons still controlled subsidies, passed statutes, and impeached ministers, by an act of 1430 which ordained that those only who held land worth 40s. a year—equal to £40 now—were entitled to vote, the majority of householders and copyholders were shut out from the franchise. Yet a sign of advancing power is visible in the change of practice which introduced bills in the form of statutes instead of as petitions liable to fraudulent modification. The 16th c. witnessed the subjugation of P. to the sovereign will of the Tudors. The

royal council usurped its legislative powers, taxation became arbitrary through forced loans, and representation corrupt because of the creation of boroughs subservient to the court. Even under Henry VIII., owing to the outward respect shown towards the forms of P., acknowledgment was made of the right to grant subsidies, enact laws, and redress grievances. But under Elizabeth members protected themselves from arrest during session, and had the right of protecting each other for crimes committed within the House. The 17th c. was a long and successful struggle for securing against the encroachments of the Stewarts the rights which had become historical. By the Revolution of 1688 sovereignty was finally transferred from the king to the House of Commons. 'From the moment,' says Mr. Green, 'when the sole right to tax the nation was established by the Bill of Rights, and where its own resolve settled the practice of granting none but annual supplies to the crown, the House of Commons became the supreme power in the state.' From the same period dates the government by party as it now exists, William III. having adopted the expedient of creating a Ministry (q. v.) from among the majority in the Lower House, instead of having a permanent cabinet immediately responsible to himself. The internal history of P., which during the 18th c. assimilated the Scotch assembly, reveals the growth to an inordinate extent of bribery and corruption. Every man had his price. Seats were openly bought and sold. P. miserably represented the country, for out of a population of 8,000,000, there were but 160,000 electors. The only reforms which had been made in the past were those of the Long P., and they had been swept aside on the recall of Charles II. In 1785 an ineffectual effort to rescue the House from the possessors of rotten boroughs was made by William Pitt, who brought in a Bill for the gradual extinction of all decayed boroughs, the immediate disfranchisement of thirty-six, and the apportionment of their members to counties. In 1800 the Irish P. was transferred to Westminster. The question of Reform was again revived in 1809 by Sir Francis Burdett, but only to be shelved. It was not till 1832 that a Reform Bill deprived fifty-six rotten boroughs of power to represent, distributed the 173 members taken from them among constituencies hitherto unrepresented in England, Scotland, and Ireland, gave the right of voting to householders paying rates in boroughs for houses of the yearly value of £10, and extended the franchise for counties to all copyholders to the value of £10 a year, and to leaseholders for not less than twenty-one years with an annual rental of not less than £50. In 1852, '51, '58, '59, '60, '66 successive Governments brought in Reform Bills without passing them, but in 1867 a measure more sweeping than any of its predecessors was added to the statute book. It extended the borough franchise to all rate-payers and to lodgers having rooms of the annual value of £10. It reduced the county franchise to £12. It withdrew thirty-three seats from English boroughs, giving twenty-five of them to the counties, and the remainder to Scotland and Ireland.

In numbers the Upper House is subject to slight fluctuation, which is due to the fact that the sovereign can create at pleasure new members of the caste from among favoured or distinguished commoners. It is composed of Lords Spiritual and Lords Temporal. For the present year (1878) there are available for attendance and vote 478 peers. These include (counting minors) 5 princes of the blood-royal, 2 archbishops, 21 dukes, 18 marquesses, 111 earls, 24 viscounts, 24 bishops, 298 barons, 16 Scottish representative peers, and 28 Irish representative peers.

The Lords Spiritual have seats on account of their temporal baronies, but they have separate benches from the Lords Temporal, at the upper part of the House, on the right hand of the throne. They are not regarded as peers, but simply as Lords of P. The Bishop of Sodor and Man does not sit at all, and with the three exceptions of London, Durham, and Winchester, the English bishoprics have, in rotation, been similarly situated since the proclamation of Manchester as a see in 1847. The representative peers of Scotland are elected for each P. by a periodical arrangement among themselves. In 1708 the Scotch titles were added to the peerage-roll of the House of Lords, and all subsequent claims have been inserted there. But no titles on the roll in representation of which votes have not been rendered in the House of Lords since 1800, can be called over at the elections without a special order of P. The Irish representative peers are elected for life. All peerages are annulled on conviction of high treason, and only the removal

of the attainder entitles a descendant to retake the original title. Conviction of felony annuls a peerage by writ; it does not affect a peerage by patent. Peers may have in attendance at the House of Lords the judges of the Courts of Queen's Bench and Common Pleas, the Barons of the Exchequer, who are serjeants-at-law, and have the degree of the coif, and Queen's Counsel, who are serjeants.

The House of Commons, though in the course of its history its numerical proportions have repeatedly changed, has now a fixed maximum of 652 members. The following table shows the relationship of constituencies, representatives, and electors, prepared in the case of England, Ireland, and Wales, from statistics for 1876-77, and of Scotland for 1877-78.

	No. of Con- stituencies.	No. of Repre- sentatives.	No. of Electors.

Representatives in the House of Commons previous to the statutes 21 and 22 Vict. c. 26, required to show a property qualification of £600 a year before being returned for counties, and £300 for boroughs. Except the Master of the Rolls, no judge can stand for P. Roman Catholic priests and clergymen of the Established Church are disqualified. A sheriff may not sit for his own county. Revenue officers, and men holding Government contracts, other than negotiations for loan, cannot represent. Felons, traitors, and bankrupts are incapacitated. By the acceptance of office an M.P. annuls his own election until under a new writ he is returned, but he may shift from one official position to another without a second appeal to his constituency. Members who resign do so by an application for the stewardship of the Chiltern Hundreds. A P. composed of new representatives is called by the issue of writs to the sheriffs of counties from the Clerk of the Crown, directed by the Lord Chancellor, who takes the initiative from the sovereign. A day is set apart for the elections, and in accordance with the Ballot Act of 1872 candidates are nominated by a document having the signatures of a proposer and seconder and eight other electors. This is handed over to a returning officer. Should the candidates be more numerous than the vacancies, an adjournment of the election occurs, and a poll is taken under the secrecy of the ballot. The result is announced by the returning officer, and sent back to the Clerk of the Crown.

The separate functions of the three constituent parts of P. are marked off with perfect definiteness. The sovereign is held to be personally above the law, irresponsible and incapable of doing wrong, the sole fountain of all honour, the original grantor of all property, the source from which all authority of every kind, in the first instance, issues. 'Our system,' writes Mr. Freeman, 'gives the state a personal chief, a personal embodiment of the national being, which draws to itself those feelings of personal homage and personal duty which a large class of mankind find it hard to look upon as due to the more abstract ideas of law and commonwealth.' From the ascension of Edward I. hereditary succession became the rule. But the dates 1399, 1660, and 1688 establish revolutionary precedents which take no account of those sovereign attributes which have been proved to be derived by the subtlety of lawyers. It was the

Act of Settlement which made the crown permanently hereditary. To it, through the ministry, is intrusted the duties of summoning, proroguing, and dissolving P. The summons must be annual because an annual consent of the Commons is required in order to obtain money for the spending departments. A prorogation annihilates all business except impeachments in the Lower and appeals and writs of error in the Upper. It is enforced by the Lord Chancellor announcing it in the presence of the sovereign, by proclamation, by commission, or by writ under the Great Seal. Dissolution is announced either by the sovereign or a representative, after which a proclamation states that the Chancellors of Great Britain and Ireland have been ordered to issue new writs. P., which, during its earlier history, had no limits to its duration apart from the will of the sovereign, was by 1 Geo. I. c. 38 enacted to last at its longest for seven years. The sovereign must concur in every measure before it can become a legislative enactment. The public expenditure is his responsibility. He nominates judges, governors of colonies, officers of the army and navy, bishops and deans; despatches and receives ambassadors; treats with foreign Powers; and declares peace or war. By Coronation Oath he is bound to govern according to the statutes in P. agreed on, and the laws and customs of the same. By the Act of Settlement he may not be either a Papist himself or marry one, and he is bound over besides to uphold Protestantism, and in Scotland the government of the Presbyterian Church.

The House of Lords, in addition to its right of originating every sort of measure which is not a money bill, forms an ultimate court of appeal. Appeals from the Court of Chancery and the Court of Session, and writs of error to review judgments in the Queen's Bench, are revised for final settlement. Disputes in the election of representative peers for Scotland and Ireland are decided. Claims of peerage are adjusted, and lords indicted by a grand jury are tried. Peers are permanently free from arrest in civil affairs. The House of Commons has a similar right of introducing legislative measures, with the immensely important addition that it alone may levy taxes and regulate the expenditure of the public income. It has the power of committing its own members and others who have perpetrated a breach of privilege to the Tower or Newgate for contempt. It may also decree punishment for libels upon its own proceedings, for the premature publication of evidence given before a select committee, for threat, assault, or wilful disobedience of the orders of the House, for offering bribes, interfering with its officials, or tampering with witnesses.

The aggregate power of P. is absolutely without limit, and there is no public or private interest which may not come under its cognisance. The succession to the throne, its own and the national constitutions, may all upon occasion be altered. It has the power of repeal and amendment of all laws passed in the colonial legislatures. Over the House of Lords presides the Lord Chancellor or Lord Keeper of the Great Seal, or in their absence a deputy-speaker, who is chairman of the Lords' committee. His authority is not greater than any of his brother peers, and he has the privilege both of vote and speech. In the House of Commons the Speaker can neither speak nor vote on a question except in an equality of voices, when he has a casting vote. His duties consist in applying the rules of order, in determining the precedence of members rising to address the House, in putting questions and explaining the will of the House concerning them, in notifying its resolutions to others, in conveying thanks or censure, in issuing warrants and writs, and in directing the printing of votes and proceedings. The deputy-speaker is the Chairman of the Committee of Ways and Means. Other officers of the Houses, not members, are, in the Upper, Clerk of the P., Gentleman Usher of the Black Rod, Yeoman Usher, Clerk Assistant, Serjeant-at-Arms; and, in the Lower, Clerk of the House, Serjeant-at-Arms, Clerk-Assistent, second Clerk-Assistent. On the assembling of a new P., the Clerk acts as Speaker of the Commons, until the election takes place of a member duly sanctioned by a majority of the House, after which, on the invitation of Black Rod, he, accompanied by the Commons, enters the House of Lords to have his appointment approved. The ancient rights and privileges of the Commons are then asserted and confirmed, and both Houses proceed to the oaths and introductions. Either in person or by commission the sovereign then declares the causes for summoning P., and the Commons having once more appeared at the bar of the

House of Lords, the sovereign either reads a speech, or it is read by the Lord Chancellor. The same afternoon an address is made in reply to it, two members in either House being previously chosen by the Ministry to move and second it. Business may be proceeded to in the Upper House if three peers are present. Forty members are required to make up a house in the Lower. In both, prayers are read before proceedings commence. Questions affecting internal order and the formalities of introducing bills and promulgating statutes are regulated by 'standing orders,' or 'resolutions' declaring the practice of P. for a limited period. 'Orders of the day' consist of business already pre-arranged for consideration. They are taken on Mondays, Wednesdays, Thursdays, and Fridays. 'Motions' are taken on Tuesday. Wednesday is understood to belong more particularly to the orders of private members, Government orders being first on the list during the remainder of the week. Except in the case of merely formal motions a motion must be seconded in the House of Commons. The same rule does not hold in the House of Lords. If an amendment has been proposed the question cannot be withdrawn till the amendment has been withdrawn. Members may endeavour to set questions aside by the use of four forms of the House. A motion may be made 'that the House do now adjourn,' or that 'the orders of the day be now read,' or 'the previous question' may be moved, or an alteration upon the original motion amounting to an amendment may be suggested. 'Content' or 'non-content' are the party responses made to the speeches on putting a question in the Lords, 'aye' or 'no' in the Commons. The question is settled by the House 'dividing,' that is the affirmative party go into the right lobby and the negative into the left, two clerks counting them one by one. P. is in the habit of facilitating progress in business by resolving itself into committees, which are either 'of the whole House' or 'select.' Select committees never consist of more than fifteen members, and their aim is to prosecute inquiries on some specified question. They have power to send for persons, papers, and records, and they may adjourn from time to time and from place to place. Committees of the whole House simply mean the House under the presidency of the Chairman of Committees of Ways and Means. Great latitude is then allowed in debate. Motions need not be seconded. 'The previous question' is disused. Unlimited speech is allowed on the same question. During the session of 1877, however, the leader of the House of Commons, owing to the continued abuse of the forms of the House in committee for the purposes of legislative obstruction by some Irish Home Rulers, was compelled to submit two resolutions forfeiting the privilege of more than one speech during a sitting, and depriving members of the right of moving oftener than once 'to report progress,' or to vacate the chair. The arrangement was only temporary. The chief work of P. is devoted to the passing of bills, which are of two kinds, public or private; and most of these originate with the House of Commons, owing to the fact of its control over all taxes and supplies. Bills are read three times before becoming law. The first reading is rarely opposed, an interval being allowed for printing and circulation. Opposition is offered on the second reading, but if it be accepted by the House, it is sent into committee for consideration, after which it is reported with amendments and ordered to be read a third time. When both Houses have agreed to its provisions, it is left in the House of Lords for the royal assent. In the case of private bills, four 'examiners' first of all take them in hand, and, according to their report, they are delegated to a Committee of Standing Orders, who again report to the House. This second reading is conducted just like public bills, after which they are referred to a Committee of Selection, who classify them, and nominate for the committees on them. Railway and canal bills are considered by a 'General Committee of Railway and Canal Bills.' Supplies are exclusively granted by the House of Commons, which on a given day resolves itself into a Committee of Supply for the consideration of the different estimates and the specific grants which are to be voted. On the first report of the Committee of Supply the House appoints a day for resolving itself into a Committee of Ways and Means to determine how the voted funds are to be raised and applied. It is one of the duties of P. to receive petitions which are presented by a member. It is one of its powers to be able to order returns from all the public departments. See Stubbs's *Constitutional History of England* (vols. i. ii. 1875, vol. iii. 1878); Freeman's *Growth of*

the English Constitution (1876); Sir T. Erskine May's *Laws, Privileges, Proceedings, and Usages of P.* (6th ed. 1868); Hallam's *Constitutional History of England*; Irving's *Annals of Our Time, A Complete Collection of the Petitions of the Lords, with Historical Introductions*, edited by Professor E. Thorold Rogers (3 vols. Oxf. 1875); and Burton's *History of Scotland* (new ed. 1873).

Parma and Piacenza, a former duchy of N. Italy, comprising the territory of the present provinces of P. and Piacenza, and bounded N. by Lombardy, S. by Genoa and Tuscany, W. by Piedmont, and E. by Modena. Area, 2268 sq. miles; pop. 490,000. The natural boundaries are the Apennines in the S. and the Po in the N. The northern plain is watered by the Enza, Parma, Taro, and many other streams, all flowing from the upland valleys of the great range to swell the volume of the Po. Forests of oak and chestnut trees clothe the mountain spurs, and the plain produces abundantly wheat, rice, olives, grapes, and southern fruits. Other products are salt, petroleum, marble, and alabaster, and there is much silk-culture, cattle-rearing, and cheese-making.

History.—The duchy was formed out of the Papal property by Pope Paul III. of the Farnese Family (q. v.), and conferred on his natural son Pietro Luigi Farnese in 1545. It became the patrimony of the Farnese, and the dukes, who were for the most part popular with the middle and lower classes, gained an evil reputation among the other princes of Italy, with one or other of whom they were usually quarrelling. On the expiry of the direct Farnese line, and in accordance with the Treaty of the Hague, the duchy passed in 1731 to Don Carlos, the son of Elizabeth of Spain, who gave it up to Austria in exchange for the throne of the Two Sicilies in 1735. In 1748 it was restored conditionally to Spain, and after the death of the enlightened Ferdinand in 1802, was seized by France and incorporated as the department of Taro. By the Treaty of Paris it was conferred on the ex-Empress Maria Luise of Austria, and this settlement was confirmed in 1817, subject to the condition that on her death the duchy should pass to the rightful heir, Ferdinand Carlo, Duke of Lucca, the son of Maria Louisa, sister of the King of Spain. The duke, who succeeded as Carlo II. in 1847, ruled with great severity, and on the outbreak of a revolution was forced to leave his dominions in 1848. After the triumph of Austria over Sardinia, in the war of 1848-49, Carlo III. ascended the throne which his father had abdicated, and inaugurated a rule more tyrannical than ever, in which he was strongly seconded by an Englishman named Ward, his chief minister. Carlo was assassinated in 1854, and his widow, Louise-Marie-Therese de Bourbon, daughter of the last Duc de Berry, after an ineffectual attempt to appease the popular demand for reform, was obliged to leave the country in 1859, on the beginning of another war between Austria and Sardinia. In March 1860 P. was finally annexed to the latter power.

Parma, capital of the province and formerly of the duchy of the same name, in N. Italy, on both banks of the river P., 12 miles S. of the Po, and 75 S.E. of Milan by rail. It is circular in form, surrounded by bastions, and is divided into an E. and W. part by the small river, which is crossed by several bridges. Though an ancient town, it has an entirely modern appearance. The chief street, part of the ancient Via Æmilia, intersects it from the Porta S. Michèle in the E. to the Porta S. Croce in the W., and crosses the Piazza Grande, in which are the Palazzo del Comune, and a statue of Correggio, erected in 1872. In the S.E. is the strong Castello, and adjoining it the Campo di Marte, while in the N.W. are the old ducal gardens *Giardino Pubblico*, containing the Palazzo del Giardino, now a military school. The Stradone, a promenade encircling the town, is laid out on the site of the old fortifications. The Cathedral (Duomo), a rare example of the Lombardo-Romanesque style, was begun in 1117, but not finished till the 13th c. Its beautiful dome is adorned with an exquisite 'Assumption' by Correggio, one of the last works of the master (1526-30), now somewhat injured by damp. It is also rich in older frescoes. Other notable buildings are the Battistero Church (1196-1270), designed by Benedetto Antelami, containing fine sculptures and frescoes; that of St. Giovanni Evangelista (1510), with dome-frescoes by Correggio; the Madonna della Steccata (1521), an imitation of St. Peter's, in which are tombs of the Farnese and Bourbon rulers; the Palazzo della Pilotta, begun in 1597, and now comprising the Museo di

Antichità, rich in Roman antiquities, the Picture Gallery, with works of Correggio, Parmegiano, Anselmi, Raphael, Titian, Tintoretto, the Caracci, &c., and a library of 80,000 volumes and 4000 MSS.; the Convento di St. Paoli, now a school, famed for the beautiful and well-preserved frescoes by Correggio; and the Teatro, one of the largest theatres in Europe. The University, founded in 1422, is attended by about 400 students. P. has some manufactures of silk, woollens, lace, hosiery, glass, and porcelain, and a trade in grain, cheese, and cattle. Pop. (1874) 44,915. Though believed to be an old Etruscan town, P. first appears in history as a thriving Roman colony, founded B.C. 183, after the conquest of Cisalpine Gaul. It was subsequently called *Colonia Julia Augusta P.*, and became celebrated for its woollen industries. Narses took it, and called it *Chrysopolis*, or the 'golden city.' It participated in the general development of the upper Italian towns, zealously espoused the cause of the Guelphs, and endured a long and ineffectual siege by the Emperor Friedrich II. in 1247. In 1303 it ceased to be a republic, and after various vicissitudes fell to the Visconti in 1341, from that period till 1512 belonging to the duchy of Milan. Later it was annexed to the States of the Church, and became capital of the duchy formed in 1545. P. was the residence of Correggio and the birthplace of Parmegiano. See Affo's *Storia della Città di P.* (Parma, 4 vols. 1792-95).

Parmegiano, whose real name was **Francesco Mazzuoli** or **Mazzola**, an artist of the Lombard school, son of the painter Filippo Mazzuoli, was born at Parma in 1503, and went to Rome, where he modelled his style on that of Correggio, and received commissions from Clement VII. After the sack of Rome by 'Bourbon's black banditti' in 1527, he removed to Bologna, and subsequently resided in his native town and in Casalmaggiore, where he died in misfortune, 1540. His works are extremely rare, and the best are two portraits in the Museo of Naples, and an altar-piece, 'The Vision of St. Jerome,' now in the National Gallery, London. Among others, P. has been credited with the introduction of etching, already practised by Dürer, into Italy.

Parmelia is the type genus of *Parmeliaceae*, an important and very extensive natural order of lichens, containing almost all the species that are useful either as esculents, medicines, or dye-weeds. It is divided into three groups—*Peltigera*, *Euparmeliaceae*, and *Usneae*. A great number of the lichens that abound on rocks and trees belong to the second of these, and in the genus P. itself we have the yellow *P. parietina* and the grey *P. saxatilis*, occurring on almost every tree. *P. perlata* is a valuable and costly dye.

Parмениdes, an ancient philosopher, was a native of Elea, a Greek colony in Southern Italy, and lived in the 5th c. B.C. Hardly anything is known regarding his life, unless we accept a doubtful story related by Plato to the effect that he visited Athens along with Zeno, one of his scholars, and there had some intercourse with Socrates. P., who has been recognised as the head of the Eleatic School (q. v.), embodied his philosophy in a didactic poem entitled *On Nature*, in which he argues that Being is absolute and imperishable, compactly contained within itself like a well-rounded ball; the apparent change which goes on around us being a mere illusion. He postulates two primordial and opposite elements, the 'ætherial fire of flame' and the 'dark night,' by the various combinations of which he conceives the world to have been formed. The fragments of his poem which remain have been published by Fülleborn (Züllichau, 1795), Peyron (Leipzig, 1810), and Karsten, in his *Philosophorum Græcorum veterum Reliquiæ* (Brus. 1835).

Parnahyba, or **Paranahyba** ('bad water'), a river in N.E. Brazil, divides the provinces of Piauí and Maranhão throughout its course of 770 miles, and enters the Atlantic by several shallow mouths in 3° S. lat., 41° 40' W. long.

Parnassus (mod. *Liakura* or *Lykari*), the most important mountain mass in Middle Greece, lies 10 miles N. of the Gulf of Corinth. It is isolated on three sides, but is connected on the W. by a wooded chain (Iona), with the border ranges of Ætolia and Doris. Its higher slopes are still densely clothed with pines, and several of its rocky summits are covered with snow for a great part of the year. The loftiest peak, called by the ancients *Lykoria* (whence the modern name), is 8068 feet above the sea, and commands a magnificent view, reaching N. as far as Thessaly, and S. to the mountains of Arcadia in the Peloponnesus. On its

southern side lay Delphi (q. v.), the seat of the famous oracle of Apollo, and the fountain of Castalia (q. v.). On the approach of spring, the Thyades, votaries of Dionysos (Bacchus), held their orgies in honour of the god on the heights of P., but the whole mountain was peculiarly sacred to Apollo and the Muses; hence the phrase 'to climb P.' came to mean 'to write poetry.'

Parrell, Thomas, an English poet whose reputation surpasses his merit, was born in Dublin in 1679, studied at Trinity College, took holy orders in 1700, and was made Archdeacon of Clogher in 1705. At first a Whig, he rallied to the Tories towards the close of Queen Anne's reign, obtained a prebend by the help of Swift, and in 1716 was made vicar of Finglass. The death of a charming wife induced habits of intemperance, and P. died at Chester, July 1717, at the early age of 38. In 1722 his friend Pope published a collected edition of his *Poems*, not one of which except the *Hermit* now survives in any human memory, and it is amazing that it should survive.

Parochial Board is in Scotland the board in each parish intrusted with the relief of the poor; for which purpose it is authorised to impose assessments. See POOR-LAWS.

Parody (Gr. *para*, 'beside,' and *ōdē*, 'a song'), a species of burlesque, the invention of which is ascribed by Aristotle to Hegemon, an Athenian comic poet. It takes a serious composition, and while closely preserving its outward form, wholly changes its inner character by substituting the ridiculous for the sublime—a Cockney fireman for a Norman baron. The parodist, in fact, is like a caricaturist who fits the heads of living characters to the 'Laocoon' or 'Order of Release.' Homer was parodied in the *Batrachomyomachia* ('Battle of Frogs and Mice'), Euripides by Aristophanes, Nero by Persius, Chapelain by Boileau and Racine, Voltaire by Dominique, and Kotzebue by Mahlmann. In English we have the *Rejected Addresses* (1812) of James and Horace Smith, the *Bon Gaultier Ballads* (1854) of Theodore Martin and Professor Aytoun, the latter's *Firmilian*, a *Spasmodic Tragedy* (1854), and the parodies contained in Lewis Carroll's *Phantasmagoria* (1869) and Calverley's *Fly Leaves* (1874). The best prose parodies are Thackeray's *Novels by Eminent Hands* and Bret Hart's *Condensed Novels* (1867). See Delepierre's *La Parodie chez les Grecs, chez les Romains, et chez les Modernes* (Lond. 1870); and P. and Parodists in the *British Quarterly Review* (January 1878).

Parole (1) The countersign or pass word required to be given to guards and sentinels in camp and garrisons by all who approach their posts before they can be allowed to pass. (2) The promise made by a prisoner of war upon his honour that he will not go beyond certain limits, or take up arms against his capturers, if liberated. Officers are frequently released in modern warfare simply on their parole, the breaking of which would be considered utterly disgraceful and unpardonable.

Parole. See PRISONERS OF WAR, LAW REGARDING.

Parole Proof is in law evidence by the oath or Affirmation (q. v.) of a witness, in contradistinction to evidence by writing. In England, any agreement not under seal is called a P. agreement.

Paros, an island of Greece, and one of the largest of the Cyclades, 6 miles W. of Naxos, has an area of over 80 sq. miles, and a pop. of 6000. It is mountainous, and abounds in white Parian marble, reckoned by the Hellenic artist only inferior to that of Mt. Pentelicus. Two quarries were opened in 1844 in the N. on Mount Elias or Marpesus. Other products are cotton, wax, honey, and wild pigeons. On the W. coast is the town of Parikia (*Paros*), with 1917 inhabitants. P. was colonised by the Ionians, and prospered so rapidly as to send colonies to Thasos, to Parium on the Propontis, and to Pharos on the Illyrian coast: After the battle of Marathon, Miltiades failed to subdue the island with 70 ships, but eventually it became subject to Athens. The 'Parian Chronicle' (see ARUNDEL MARBLES) was found here in 1627.

Parotitis. See MUMPS.

Parquetry (Fr. *parquet*, 'an inlaid floor') is a kind of marquetry used for floors. Oak is commonly employed for the groundwork, and in it ornamental coloured woods are so inserted as to produce a rich and beautiful pattern. 'Solid parquet floors' are the most durable, and consist of pieces of wood, one inch thick, grooved and tongued together.

Parr. See SALMON.

Parr, Samuel, LL.D., a learned English divine, was born at Harrow, 15th January 1747, educated at Harrow School and Emmanuel College, Cambridge, and afterwards filled the situation of assistant-master at Harrow for five years. He then opened a school of his own at Stanmore. In 1777 he was appointed master of Colchester School, and afterwards at Norwich. Having taken orders, he became rector of Asterby (1780), curate of Hatton (1783), rector of Wadenhoe (1790), and rector of Graffam (1802). He died 6th March 1825. P. was a man of extensive acquisitions, particularly in classical learning, but lacked the originality of intellect necessary to make use of them. Though famed among his contemporaries as a brilliant conversationalist, none of his voluminous writings sustain his reputation, and it is impossible that he can be permanently remembered. An edition of his works was published by Dr. Johnstone, in 8 vols., 1828.

Parra. See JACANA.

Parrakeet', or **Parroquet**, a name given to various genera of Scansorial birds of the family *Psittacidae* or Parrots (q. v.), from which, however, they differ in certain important particulars. The parakeets are smaller than the parrots. They are included in the sub-family *Pezophorina*, in which the legs are somewhat longer than in the parrots, and thus fit their possessors for a terrestrial life. The bill is of moderate size, and its tip may be toothed. The tail is broad and long, and its feathers are narrowed at the tip. A typical example of the P. is found in the P-Cockatoo of Australia, a continent which may be regarded as the headquarters of this bird. The P. runs on the ground with great ease and swiftness. It attains a length averaging that of a small crow, and is of a yellow colour on the head and throat, the head bearing a crest. The back is brown and the wings white. The female has a greenish tinge on the head and throat. The yellow-bellied P. (*Platyercus Caldonicus*) is found in Van Diemen's Land and the islands of Bass's Straits. To the genus *Platyercus* belong the great majority of the parakeets. The back of the species just named is of a mottled green, the forehead crimson, the throat and part of the wings blue, and the belly yellow. Another species of this genus is the rose-bill P. (*P. eximius*), found in New South Wales and Van Diemen's Land, and exhibiting the most gorgeous hues. The back is of dark glossy green, and the chin and throat are white, the head and face scarlet, and the under parts light green. The ground P. (*Pezophorus formosus*) is a very typical member of the group, and occurs in S. Australia. It runs actively on the ground, while its flight is low and feeble. The colour is dark green above and yellow below, and the tail is long and slender. The ringed P. (*Falcornis torquatus*) is a native of Africa and Asia, another species being the Alexandrine ringed P. (*P. Alexandri*). The colour is grass-green, the neck being encircled with a ring of black colour, and rings of purple and rose as well. The zebra or grass P. (*Melopittacus undulatus*) inhabits Australia, and is of a dark green colour, varied with brown and yellow. The blue-banded grass P. (*Euphemia Chrysostoma*) is found in summer in Van Diemen's Land. Its colour is green tinted with brown.

Parramatt'a is the second oldest town in New South Wales, having been founded in November 1788. It is beautifully situated on the P. River, which is virtually an elongation of Port Jackson (q. v.), 14 miles W. of Sydney, with which P. has communication by both railway and steamers. It contains many public buildings, including the Government House, Benevolent Asylum, two large lunatic asylums, an extensive penal establishment, and five important public schools. Orange-growing and the manufacture of tweeds are the principal industries. The largest orange trees in the world are believed to be at P. Pop. (1875) 6103.

Parrhasius, according to Pliny, the most insolent and arrogant, but also the most gifted painter of his age, was born at Ephesus in the 5th c. B.C., became afterwards a citizen of Athens, where he lived as a contemporary of Socrates, and painted a number of works, in which he carried high art to perfection in all essential particulars. P. is said to have combined the respective merits of his great predecessors, Polygnotus, Apollodorus, and Zeuxis. So skilled was he in the theory of his art, that

he was named the Legislator. Among his chief works were his allegorical representation of the Athenian people or 'Demos,' in which the contradictory qualities of Athenian society were indicated; the 'Theseus,' which was subsequently placed in the capitol of Rome; 'Ulysses feigning Insanity,' and the 'Hoplites,' or heavy-armed warriors. The subjects of his works were not always unexceptionable. His 'Archigallus,' and his 'Meleager and Atalanta' prove that the production of licentious works was not confined to the period of the decline of Grecian art.

Parricide (Lat. *parricida*, prob. from *pater*, 'father,' and *cado*, 'I slay') is hardly a legal term in England, the murderer of a father being punishable in the same measure as the murderer of a stranger. In the Roman law the crime was punished with extra severity.

Parrot, a name applied to various genera of Scansorial birds belonging to the family *Psittacidae*. In the sub-family *Psittacina*, to which the typical P. belongs, the upper mandible is deeply arched and hollowed, and the edges of the lower mandible are wavy and curved. The wings have their first and second quills longest. No crest is borne upon the head in the true P. The best known species of P. is the grey P. (*Psittacus erythacus*), which has so long been celebrated for its talking powers. This bird inhabits W. Africa. The general colour is ashen grey, the tail being scarlet. Both sexes are capable of talking, although the males are perhaps more loquacious than the females. Very rarely has this bird bred in Europe. The attachment exhibited by parrots to their master and mistress is by no means the least noticeable trait in their character. The faculty or power of imitation is strongly developed, the most unusual noises and sounds being mimicked with a faithfulness that almost exceeds belief. The green P. (*Chrysotis festinus*) is a native of S. America; another American species, the Amazon green P. (*C. Amazonicus*), is also well known in Britain. The first is the larger of the two. It is of a bright green colour, the top and back part of the head being of cobalt-blue colour. The back in its lower portion and the wing-coverts are crimson, and the tail, which is short and square, is green. The Amazon green P. learns to talk more readily than the green P., and attains a length of 12 inches. The cheeks and chin are yellow, the forehead purple, and the general body-plumage green. The tail-feathers are marked with green, red, and yellow. The name of Philip Island P. is applied to a species of cockatoo (*Nestor productus*), and the owl P., is the *Strigops habroptilus* of New Zealand, a species widely different from the true P. The Carolina P. (*Conurus Carolinensis*) is a macaw, attains a length of about 21 inches, and has the bold colours of the latter bird.

Parrot Fish, the name given to various *Telostean* fishes of the genus *Scarus*, and which are included in the family of the Wrasses (q. v.) or *Labridæ*. In the genus *Scarus* the head is convex, and the jaws are covered with minute scale-like teeth, adapting these fishes for browsing on the coral-polypes, and for crushing the hard substances on which they feed. They inhabit tropical seas. A well-known species is the *Scarus harrid*, or tessellated P.-F., inhabiting the coasts of Ceylon. Another species (*S. creticus*) occurs in the Mediterranean. The former is of a bluish tint, marked with bright yellow, the fins being brown. The name P.-F. is derived from the appearance of the jaws, which somewhat resemble the beak of a parrot in shape.

Parry, Sir William Edward, a celebrated explorer, was born December 19, 1790, at Bath. At thirteen he entered the navy, and in January 1810 received a lieutenant's commission, after which he was employed for three years in protecting the British whale-fishery in the northern seas. Ordered in 1813 to proceed to Halifax, in Nova Scotia, he in the following year took part in the war between England and America. After the Peace of 1814 P. remained on the N. American station without preferment till 1817, when he returned to England, too late to join the expedition to the Congo sent in that year. In April 1818, through the influence of Mr. Barrow, Secretary to the Admiralty, he was appointed to the command of the *Alexander*, which was to sail under Commander John Ross in the *Isabella* to seek a N.-W. Passage (q. v.). The ships returned in November without having made any discoveries. P. represented that this was due to a mistake of his commander, and was in consequence appointed to lead a second expedition for the same purpose with two ships, the *Hcla* and *Griper*. Leaving the Thames,

11th May 1819, they crossed on the 4th September the meridian of 110° W. long., in $74^{\circ} 44' 20''$ N. lat., by which they became entitled to a reward of £5000, and discovered Barrōw's Strait, Melville Island, Baring Island, Prince Regent's Island, and Wellington Channel. After wintering on Melville Island from the 20th September to the beginning of August 1820, they returned, and reached the Thames in November 1820. P. immediately received the rank of commander. In a third expedition in the *Hecla* and *Fury* (May 1821 to October 1823) he was less successful. After being frozen in at Winter Island from the 8th October to the 2d July 1822, he discovered the *Fury* and *Hecla* Strait, and returned to the Thames in October 1823. In his fourth expedition (May 1824–October 1826), he lost the *Fury*, and was forced to return prematurely. After his return, P., who had been made a post-captain in 1821, was appointed hydrographer to the Admiralty. On the 3d April 1827 he led yet another expedition, this time to seek the North Pole by way of Spitzbergen. On the 22d June he left his ship, the *Hecla*, and proceeded with twenty-four men in two flat-bottomed boats, which they had often to drag over the ice, as far as $82^{\circ} 45'$ N. lat., when, stopped by a current, they returned to the *Hecla* on the 21st August. From this, his last voyage of exploration, P. returned to London at the end of September. Accepting the office of agricultural commissioner in New South Wales, he remained there from 1829 to 1834, in the latter year returning to England. In 1852 he became Rear-Admiral of the White. P. died at Ems, in Germany, 7th July 1855. See his *Journal of a Voyage for the Discovery of a N.-W. Passage* (Lond. 1821); *Journal of a Second Voyage for the Discovery of a N.-W. Passage from the Atlantic to the Pacific, performed in the years 1821–22–23* (ib. 1824); *Journal of a Third Voyage for the Discovery of a N.-W. Passage* (ib. 1826); and *Narrative of an Attempt to Reach the North Pole* (ib. 1827); also *Memoirs of Rear-Admiral Sir W. E. P.*, *Knt., F.R.S.*, &c., by his son, the Right Rev. Edward P., Suffragan Bishop of Dover (Lond. 1857).

Par'sees ('inhabitants of Pars' or Persia) is the name given to the adherents of the ancient religion of Persia, or Zoroastrianism. Coming originally from the great home of the Aryan Race (q. v.) in Central Asia, the Zoroastrians seem to have entered the Punjab with the ancestors of the Hindus, whence after a time they migrated westward to Bactria, Media, and Persia. These facts are deduced from (1) the great affinity between the Sanskrit (q. v.) or ancient Indian, and the Zend or ancient Bactrian languages; (2) from the fact that the Indians and the Persians, in their earliest written records, both apply to themselves the name of Aryas; and (3) from the resemblances between the mythologies of the Vedas (q. v.) or primitive Hindu Scriptures, and the Zend Avesta (q. v.) or Scriptures of the P. A number of personages mentioned in the Veda correspond in name with others in the Avesta, e.g., the Indian Yama, the king of the dead or at least of the blessed, and the Persian Yima, a fortunate monarch with whom the blessed live; the Persian Thrætaono, 'who destroys a pestilent serpent with three heads, three girdles, six tails, and a thousand powers,' and the Indian Trita, 'who fights with a serpent and smites a three-headed dragon with seven tails, and liberates the cattle'; the Persian hero Sama Keresaspa, and the Indian warrior Krisasa named in the Puranas; the Indian Kavya Usanas, and the Kaus of the later Persian legends. Besides this identity of person, the Hindus and P. have some important ceremonies in common: (1) the Soma, Persian Homa (which is identical), offering. This is a plant, the juice of which is pressed out and drunk with certain religious ceremonies. (2) In both religions the reception of neophytes is performed by investing them with a girdle or thread. The two have also at least two of their deities in common—Mitta and Soma or Homa (the plant), to the latter of whom there are applied in both a great number of epithets, which clearly show how short a period had elapsed since the Persian and Indian adherents of this worship had become separated from each other. There are also certain indications that the separation of the two nations was occasioned in part at least by religious causes, in the fact that deities which are good in the one religion are evil in the other. Thus Ahura (see ORMUZD), the highest god of the Persians, as Asura was reckoned among evil spirits by the later Indians; *vice versa*, the good Devas of the Indians, and Siva (q. v.), a member of the later trinity, were in Persia transformed into evil spirits—Daevas (the allies

of Ahriman (q. v.) and S'arva); and Indra, the highest god of the earliest Hinduism, is by the Persians banished to hell. Some scholars, however, are doubtful whether these opposing conceptions regarding the deities necessarily imply a religious schism, as the same effect might have been produced by the reformation of Zoroaster, when 'the deities of the old nature-worship may have shared the fate of so many heathen divinities, which Christianity thrust down to hell.'

When the reformation of Zoroaster (q. v.) took place is unknown. His date has been fixed as early as 3000 B.C. (Bunsen: Aristotle puts it as high as about 6360 B.C.), and as late as 1500 B.C. The first authentic records of Persian history date from the reign of Cyrus (B.C. 550), the first of the Achaemenian dynasty. The history of the period during which this dynasty held sway (about 200 years) is recorded in Cuneiform Inscriptions (q. v.); but although so much of the Chaldean religion is preserved in these, the Persian inscriptions are all historical, and give no information regarding the Zoroastrianism of the day. After the conquest of Alexander (B.C. 331), the history of Persia as an independent nation is a blank for 500 years. The Sassanian dynasty was then founded (A.D. 226) by Ardeshir Babegan, who endeavoured to restore the national religion to its primitive splendour, and in whose reign, or that of one of his immediate successors, the Avesta was reduced to writing, having hitherto been preserved by oral tradition. The vernacular of the time was the Huzvaresh or Pehlevi (q. v.), into which translations of the Avesta were made from the Zend, and under the later Sassanians into another dialect, the Parsi. The Sassanian dynasty was overthrown and the ancient empire of Persia for ever swept away by the Mohammedan invasion (A.D. 637), and the Zoroastrian religion all but rooted out of Persia. There lingered for some years a fond but secret attachment to the old religion in the eastern provinces; indeed 'the old Persian creed and moral system exercised a greater influence on Mohammedan writers than is generally supposed.' The open adherents, or P., withdrew to the mountainous region of Khorassan, where a few thousands are found to this day. (See GUEBRES.) About the middle of the 7th c. a number emigrated to India, and were followed by others at different times. Settling first at Guzerat, and then passing on to Surat (after 1668), they finally arrived at Bombay, which has owed much of its prosperity to their industry and enterprise. Like the Jews, whom they resemble in other respects, as well as in commercial enterprise, they have preserved throughout centuries of subjugation both the purity of their blood, and the exactitude of their ceremonial observances.

Besides some 5500 in Persia, the number of P. throughout all India, according to the census of 1868–72, was 69,000, of whom 44,000 were found in the island of Bombay, and 23,500 in other parts of that Presidency. The influence of English ideas is working a great change among the Indian P. It has already divided them into two classes, the 'old' and the 'young,' the Conservatives and the Liberals, the latter of whom 'desire to throw off the abuses of former ages (e.g., the filthy purifications by means of Nirang, the large number of obligatory prayers, which are in Zend, of which no one understands a word, &c.), and to avail themselves, as much as is consistent with their religion and their Oriental character, of the advantages of European civilisation.'

The name of Fire-worshippers, which is applied to the P., they repudiate. All they admit is that they are taught to face some luminous object while worshipping God, that they regard fire as an emblem of the Divine power, and that there is a kind of national instinct or indescribable awe felt by P. towards light and fire, a feeling which has been compared to that with which many Christians regard the Cross.

The creed of the modern P., which is embodied in a catechism published about 1840, is a very short one. 'They believe in one God, to whom they address their prayers. Their morality is comprised in these words—pure thoughts, pure words, pure deeds. Believing in the punishment of vice and the reward of virtue, they trust for pardon to the mercy of God.' See Max Müller's *Chips*, &c. vol. i. (2d ed. Lond. 1868); Muir's *Sanskrit Texts*, vol. ii. (2d ed. Lond. 1871); Haug's *Essays on the Sacred Language, &c., of the Parsis* (Bomb. 1862); Dossabhoj Framjee's *Parsies* (Lond. and Bomb. 1858); Dadabhai Naoroji's *Manners and Customs of the Parsies and the Parsi Religion* (Liverp. 1861).

Parsley, a name of doubtful origin, applied to the well-known culinary vegetable long in cultivation for seasoning and garnishing purposes. Botanically the name has varied from *Petroselinum* as a genus to this as a specific name under the genera *Apium* and *Carum*. Its native country cannot now be ascertained, but the plant has established itself (as an escape from gardens) on old walls and in waste places in various European countries. In domestic use it is much valued for communicating flavour to soups and stews. Where it is used for garnishing, the varieties with much-curved leaves have the preference. To meet a constant demand three or four successive sowings should be made from February to May. What is called celery-leaved P. is sometimes grown for its leaf-stalks, which are blanched and used the same as celery; and Hamburg P. is a variety occasionally cultivated for its rootstock, which is eaten like parsnips. Much superstition is connected with P., and very strange notions concerning it remain current in England and Scotland to the present day. It is usual to sow a small quantity of P. in sheep pastures. See FOOL'S P.

Parsnip, or **Pastinaca**, the name given to an esculent root introduced into use at an early period, and known to be the produce of *P. sativa*, a plant found wild in Europe and W. Asia. The genus is now botanically reduced to a section of *Peucedanum*, from which it differs chiefly in having no bracts or bracteoles and by the absence of calyx-teeth. In England the P. is not uncommon in calcareous districts, but probably exists in Scotland as an escape from gardens only, and is certainly an introduction in America. As in the case of the carrot, the root of the wild plant is hard, stringy, and of no use as a vegetable until modified by continuous careful growth. Its use dates back historically to the time when Pliny wrote. During the period of Roman Catholic supremacy it was a favourite accompaniment to dried fish in Lent. Latterly it has been recommended as a substitute for potato, but it does not contain an equal amount of nourishment; the flavour, moreover, not being agreeable to some. For cow-feeding it is reported to be excellent, inducing milk of a very rich quality. A sort of beer and wine can be made from the mashed and boiled root after fermentation, as also a powerful spirit, and it is sometimes manufactured into a marmalade. Only a few varieties have been established by cultivation, of which those termed 'the Guernsey,' 'the hollow-crowned,' and 'the student,' are the best. The routine culture is similar to that of the carrot. The root is seldom attacked by diseases or insect vermin. A large coarse plant called Cow-P., is *Heracleum Sphondylium*, and the Americans give the name meadow P. to other umbelliferous plants belonging to the genus *Thaspium*.

Parson (Lat. *persona*, the 'representative' in a parish of the Church), in the ecclesiastical law of England, is one that has full possession of all the rights of a parochial church. He has the freehold of the parsonage, the glebe, the tithes, and other dues. The distinction between a P. and a vicar is this—the P. has usually the sole right to all ecclesiastical dues in his parish; but the vicar has generally an impropriator over him entitled to the larger part of the profits. There were no vicars till the reign of Henry III., before which time the rector provided a curate, and maintained him on an arbitrary stipend. The method of becoming a P. and of becoming a vicar is the same. In both cases, holy orders, presentation, institution, and induction are necessary. No person is eligible to any benefice unless he has first been ordained a priest, and he is then called a clerk in orders. No one can be a priest till he is twenty-four years old.

Parsons, Robert, born at Nether Stowey in Somersetshire, June 24, 1546, passed from Taunton free-school to St. Mary's Hall, Oxford, and became a fellow and tutor of Balliol College. In 1574 he studied law and medicine at Louvain and Padua, at Rome became a convert to Catholicism, and entered the Society of Jesus, July 4, 1575. He came with Campian to England in 1580, and, after a year of infinite perils, only escaped that martyr's fate by taking refuge in Normandy, where he founded an English School at Eu (1582). As rector of the English College at Rome (1587) P. laboured from afar for England's conversion, pouring forth a flood of controversial tracts, and making several journeys to the Spanish Peninsula, where he founded the colleges of Valladolid (1589), Lucar (1591), Lisbon and Seville (1592), besides St. Omer's in France (1593). He died at Rome, April 15, 1610. Among the pseudonymous writings ascribed to

P. are *A Brief Discourse containing the Reasons why Catholics refuse to go to Church* (Douai, 1580), *The Book of Resolution, or Christian Directory* (Rouen, 1581), *Treatise of the Three Conversions of Paganism to the Christian Religion* (3 vols. St. Omer, 1603-4), &c.

Parsons, Theophilus, born at Newburyport, Massachusetts, February 24, 1750, graduated at Harvard (1769), was called to the bar (1774), and commenced legal practice at Newburyport (1777). As a member of the 'Essex Junto,' he published the famous *Essex Result* (1778), a pamphlet upholding the constitutional doctrines of the New Englanders, and he was one of the framers of the Constitution of 1779. He removed to Boston (1800), became chief-justice of the supreme judicial court (1806), and died October 30, 1813. A Memoir of him has been published (Bost. 1859) by his son, **Theophilus P.**, who was born at Newburyport, Massachusetts, May 17, 1797, graduated at Harvard (1815), and after a tour in Europe and some years' legal practice at Taunton and Boston, was appointed Dane Professor of Law in Harvard College (1847). He is author of treatises on mercantile and maritime law, on marine insurance, and on promissory notes, of *Deus Homo* (1867), *The Infinite and the Finite* (1872), and other theological works in support of Swedenborgianism, and *The Political, Personal, and Property Rights of a Citizen of the United States* (1875).

Parsonstown, or **Birr**, a town of Ireland, in King's County, on the Brosna, 89 miles S.W. of Dublin by rail. It is said to have grown up around a monastery founded by St. Brendan in the 6th c., and its castle, the ancient seat of the O'Carrolls, after frequently changing hands, was granted by James I. to Lawrence Parsons, ancestor of the Earl of Rosse, the present proprietor. The modern Birr castle, which incorporates parts of the old structure, is the residence of the Earls of Rosse, and the late earl's famous telescope is kept here. The town, an important military station, is one of the handsomest of Irish inland towns, and has several large breweries and distilleries, and a considerable trade in agricultural produce. Pop. (1870) 4939.

Part and Pertinent is a term of Scotch law used in conveying land. It denotes that the land is conveyed with all privileges and adjuncts, such as a church pew, right in burying ground, or right of Servitude (q. v.) attached to it.

Parthenogenesis, the name given to some curious phenomena observed in the reproductive history of certain insects especially. The term P. (from the Gr. *parthenos*, 'a virgin,' and *genesis*, 'the act of production') literally means the production of young by the virgin or unimpregnated female. The contact of the male with the female element appears to be absolutely necessary for the performance of true or sexual reproduction. The *Ovum* (q. v.) or egg of the female requires to be fertilised by contact with the seminal fluid of the male before the Development (q. v.) of the embryo or young animal can be inaugurated. But it appears that in the case of the aphides or plant-lice and of the wasps and bees, the female may lay eggs from which young are produced—the eggs being kept entirely separate and apart from the influence of the male.

In the case of the bees, those eggs laid by the queen bee, and which are duly fertilised by contact with the male fluid stored up in her seminal receptacle, give birth to female bees or to neuters; those which are allowed to pass from her body unfertilised give birth to drones or males. Thus the drones are said to be produced by P. The explanation of P. rests upon the fact that probably the so-called eggs or ova are hardly analogous to true eggs, but are peculiarly modified reproductive bodies capable of being developed into new beings without fertilisation. Some naturalists term them *pseud-ova* under this idea. Other authorities maintain that the influence of one impregnation of the males extends through all the generations of females in the case of the aphides.

Parthenon (Gr. *parthenōn*, from *parthenos*, 'a virgin'), the temple of Athena in the Acropolis of Athens, the finest specimen of Greek architecture. It was a peripteral octostyle of the Doric order, with 17 columns on the sides, each 6 feet 2 inches in diameter at the base, and 34 feet in height, elevated on three steps. From the base of the pediments, its height was 63 feet, and its area 233 feet by 102. It was built under Pericles in 438 B. C., at a cost which has been estimated at £1,500,000 sterling;

its architects were Ictinus and Callicrates, while its sculptures were executed by Phidias. The P. was used late in the Middle Ages as a Christian Church, but during the siege of Athens by the Venetians under Morosini in 1687, by the explosion of some powder stored in it by the Turks, it was almost entirely destroyed. Still its magnificent ruins are sufficient to show what must have been the former splendour of the building, and its main plan has been reproduced from extensive investigations and excavations, and does not now seem doubtful. The chief remains of the sculptures were carried to England with the consent of the Turks by Lord Elgin. Known as the 'Elgin Marbles' (q. v.), they are among the choicest treasures of the British Museum.

Parthia, anciently a country of Asia, at the S. E. end of the Caspian Sea, and including the N. W. portion of the modern province of Khorassan, besides a part of Irak-Ajami. The rugged, mountainous character of the country made it a suitable home for the wild Scythian tribes, who, according to an ancient tradition, sought a refuge here as outcasts from their own race, and who afterwards founded a monarchy which made the name *parthe*, or exile, famed and feared. The early history of P. is wrapped in obscurity, but it probably formed at first a province of the Persian Empire, and it was afterwards subject to the Syro-Macedonian rule under the successors of Alexander. In 256 B. C., however, the first of the Arsacidæ (q. v.) succeeded in freeing his country, and founded a native dynasty which lasted 500 years, and under which, on the fall of the Seleucidian power, the rule of P. was extended over the greater part of Western Asia. Ancient history describes the Parthians as a wild and warlike nation, who cherished a slavish devotion to their despotic rulers, but feared nothing else. With a contempt for commerce and agriculture they united an insatiable thirst for rapine and war, in which they distinguished themselves not less by their indomitable courage than by their cunning manoeuvres. Their favourite weapon being the bow and arrow, they were accustomed to approach on horseback within a short distance of their foes and discharge a well-directed volley, then, wheeling about in feigned discomfiture, they drew their enemies into the confusion of a pursuit, until they had time to fit a second arrow to their bows, which they were trained to discharge over their shoulders, without turning their horses. After having successfully resisted repeated attempts of the Romans to subjugate its territories, P. at last fell a prey to internal dissension in 214 A. D., when a revolt headed by Ardshir broke out in Persia under Artabanus IV., the last of the Arsacidæ, in attempting to suppress which that monarch was defeated and slain. This event marked the downfall of the Parthian Empire, which was supplanted by the native Persian dynasty of the Sassanidæ (q. v.), under Artaxerxes I. The religion of the Parthians was a kind of Nature-worship, in which special reverence was paid to the heavenly bodies. From this, as well as from other particulars, modern research has conclusively proved them to have been connected in their origin with the ancient Persians.

Partial Loss. See AVERAGE, and under INSURANCE, *Marine Insurance*.

Partial Payment. No one is bound to accept P. P. of a debt. But a creditor in two or more separate debts, cannot refuse to accept payment of one of these, though the creditor decline to pay even the interest of the others. The holder of a bill is not bound to take payment of a smaller sum than the bill carries; but he is entitled to take a P. P. from the acceptor without cutting off his recourse against the other parties, provided he protest the bill, in so far as it is not paid, and in other respects duly negotiate the bill.

Participle (from Lat. *particeps*, 'taking part') is the name said to have been given to a class of words because they 'partake' of the nature of a verb and of an adjective. This is by no means certain, however. The P. is in strictness only part of the conjugation of the verb, but it is true that both adjectives and nouns can be expressed by participial forms. In such cases, however, nouns and adjectives are *not* participles. 'Dwelling in light that is inaccessible' illustrates the verbal use of 'dwelling'; while 'his dwelling stood full fair upon a heath,' shows its employment as a noun. In the former case, it denotes an *act*; in the latter, a *subject or thing*. Though these forms are now identical, they were originally distinct in English, as they still are in German. The P. 'dwelling' was 'wun-*ende*' (comp. Ger. 'wohn-*end*'); the noun 'dwelling' was 'wun-*ung*' (comp. Ger. 'wohn-*ung*').

The P. proper has two forms, a present ending in '*ing*,' and a past in '*d*' or '*ed*' (also '*t*'), with a few survivals of an old and beautiful termination in '*en*.' The P. is distinguished (says Prof. Bain) by three marks: (1) It cannot affirm or deny; (2) it may take an object; (3) it may be qualified by an adverb. In these respects it agrees with the Infinitive. In the three following it differs: (1) It has a subject; (2) it cannot be qualified by an adjective or a possessive; (3) it tends to become an adjective as it drops the peculiarities of the verb. Its skilful use gives a peculiar plasticity to the structure of English sentences. See Bain's *Companion to the Higher English Grammar* (Lond. 1874).

Partick, a N. W. suburb of Glasgow, situated on the rising ground about the Kelvin, and at the entrance of that stream into the Clyde. It has large iron shipbuilding yards, foundries, flour-mills, bleachfields, &c. P. was formed into a burgh under the Police Act of 1850, and is governed by twelve commissioners, three of whom are police magistrates. The working population are chiefly employed in the iron shipbuilding, which is about the most extensive on the Clyde. The extensive rows of handsome villas on the N. side of the burgh are chiefly occupied by business people engaged in the city. Pop. (1851) 3131; (1861) 8183; (1871) 17,000; (1877) 26,000, as ascertained by the School Board Census.

Partin'ico (*Locanda della Bambina*), a town of Sicily, province of Palermo, 19 miles S. W. of Palermo, and near the line of the projected railway to Mazzara. It has some linen and woollen industries, and a considerable trade in wine, olive oil, sumach, and fruits, which are abundantly produced in the vicinity. The valley in which it lies is surrounded by calcareous mountains, rising in isolated pyramids. To the N. is Carini (*Hyccara*), whence the Athenians are said to have carried off the young Lais. Pop. (1874) 20,154.

Parti'tion Lines, in Heraldry, lines (sometimes plain, sometimes irregular) crossing the shield in directions that correspond to the Ordinaries (q. v.). Thus *party per bend* means 'parted' or divided by a line drawn in the direction of a Bend (q. v.); *party per fesse*, by one in the direction of a Fesse (q. v.).

Part'izan (Fr. *partisane*), a kind of Halberd (q. v.), introduced into warfare during the reign of Edward IV., and restricted to the use of body-guards about the close of the 16th c., when it was usually richly engraved. The blade was long and double-edged, with two lateral projections curving upwards instead of the axe.

Part-Music, music requiring more than one performer.

Partnership (in Law). The object of a P. may be any that is lawful. To make any one liable as the partner of another, there must be an agreement between him and his colleague to share in profit or loss; or the individual must have permitted himself to be *held out* as jointly liable. Usually the partners in a business are known to the world, constituting what is called the *house* or firm; but men sometimes embark capital in a business without letting their names appear, and without sharing in the management. Those who do so are called *dormant* or *sleeping* partners. No partner, without consent of his colleagues, can transfer his share to another, nor introduce a new member into the firm. Persons agreeing to subscribe money for a specific undertaking, as to obtain or oppose a bill in parliament, are partners in the undertaking, and liable as such. A written agreement is not necessary to constitute P. It may be inferred from the acts of the parties. In partnerships, each member is liable for the joint debt, without limitation, unless the concern is incorporated. (See JOINT-STOCK COMPANIES, LAW REGARDING.) The acts of one partner in business when done without collusion and in violation of no public law, are generally binding on all the others; and this responsibility of parties cannot be limited by any agreement or stipulation in the articles of association. This general rule of law is, however, subject to modification, its object being to protect the public. Thus, if a partner give distinct notice to any one

Partizan.

with whom his firm is about to do business, that he disapproves of the proposed transaction, and that he will not be liable for it, proof of this notice will free him from liability. The general rule that a share of the profit and loss of a business makes the shareholder a partner, does not hold where the share is in a specific object, as in a ship or in the copyright of a book, the responsibility in such cases being limited to the risk connected with the object. The principle of common law that any one sharing in the profit or loss of a firm is thereby a partner and liable for its debt, has been modified by the statute of 1865, under which a loan may be made to a person engaged or about to engage in trade, the lender receiving a rate of interest varying according to the profit of the business without the lender becoming responsible as a partner. A P. may be dissolved by the expiration of the time for which it was constituted, or upon decree of court, which will be given on ground of equity. An advertisement in the *London Gazette* is not sufficient announcement of the dissolution of P. Notice should be sent to every one with whom the firm has had dealings. The laws of England and of Scotland are essentially the same as regards P., but there are minor points in which there is some difference; the legal theory in the latter country being that the P. has an individual existence apart from its constituent members, who are regarded as securities or *cautioners* (see CAUTION; English law, GUARANTY) for its debts. In both countries, but especially in Scotland, difficult questions occur respecting the rights of members of associations for religious purposes. It has been decided in a case in which a schism took place in such an association, that the use of the meeting-house remains with the members holding the religious principles of those by whom it was created. But there might obviously remain the further and greater difficulty to dispose of, in the question of which side *did* adhere to those principles. A religious association, or *church*, is in exactly the same position with regard to the civil courts as a mercantile association or partnership. That is, both kinds of association are, and in every free country ever must be, subject to the law of the land—freedom consisting in effect being given to the maxim—*Lex suprema, Salus populi*.

Partridge, a well-known genus of *Rasorial* or *Gallinaceous* birds, forming the type of the sub-family *Perdicina*, in which the edges of the bill are entire, and the nostrils covered with a scale. The tarsi are long and have divided scales in front. The bill in the genus *Perdix* itself is short, and the quills from the second to the fifth are the largest. The tail is short, and the outer toe is longer than the inner. The common P. (*Perdix cinerea*) is a well-known game bird, occurring generally throughout Europe. It attains a length of about twelve inches, the females being somewhat smaller. The general colour is a brown of varying shades, tinted with grey. The latter colour is also found on the breast, and a crescentic patch of brown exists on the lower part of this region. The P. is much tamer than the Grouse (q. v.), and appears to prefer the neighbourhood of cultivated land. Its food consists largely of grain, but it also feeds on insects, slugs, &c. The nest is a loose collection of sticks, in which from twelve to twenty eggs of an olive-brown hue are deposited about the end of April. The female sits most pertinaciously upon the eggs, and the young are able to run about as soon as they are born. The brood forms what is known as a 'covey,' and a highly characteristic feature of partridges is their habit of associating together, and of affecting their native locality. The birds pair about the middle of February, or in some seasons a little later. As in other Gallinaceous birds, the males display their plumage before the females, and engage in battles for the latter. The 'French' or red-legged P. (*Caccabis rufa*) is larger than the species just described. It may be known by the black mark or bar on the forehead, and by the markings of similar colour on the back and flanks. The red-legged P. is a native of S. Europe. It is common in France and Italy, and in the eastern English counties, where it has almost driven out the English bird. The eggs number sixteen or seventeen, and are of a yellowish-white marked with brown. The upper parts are of a warm brown colour. The eye is marked in front and behind by a white line; the breast is grey, and the abdomen is of a fawn tint. The beak and legs are of a reddish hue. The French partridges do not fly in coveys like the English, and are much stronger on the wing.

Partridge Berry. See GAULTHERIA.

Partridge Pigeon (*Geophaps*), a genus of *Columbidae* or doves belonging to Australia, and in some respects appearing to unite the characters of the two birds whose names they bear. They are sometimes named 'Bronze-wings,' from their plumage. The upper parts are brown, the breast being of a paler tint, and the abdomen grey. A familiar species is the *G. or Phaps, Chalcophaps*, which, when in good condition, may weigh 1 lb. Its flesh is highly esteemed. The P. P. appears to have a fondness for water, and may be found in large numbers in the vicinity of pools.

Partridge Wood. The trade names for the various woods imported into Europe have in many cases been so multiplied and confused that it is almost a hopeless task for the botanist to unravel the complicated mass of error. In the case of P. W. the name is applied to a timber introduced from S. America and the W. Indies, in plants of a reddish colour, beautifully streaked with lines of a darker shade, or sometimes marked so as to call to mind the plumage of a partridge. It is valued by cabinet-makers, and is also used in the manufacture of various fancy articles, such as parasol-sticks, &c. From the French name of *Pois perdrix*, corrupted into *Bois perdrix*, it has been stated by some to be the produce of *Heisteria coccinea*, but this is not the case, and though *Andira inermis*—the 'bastard cabbage-tree' of the W. Indies and Brazil—has been advanced with better claim, the actual source of the P. W. still remains unsettled.

Parts of Speech are the different classes into which the words of a language are arranged by grammarians. The principle of classification is that a word shall be named according to the office or function it discharges. If it denote a thing it is said to be a *noun*; if it mark some quality or attribute of the noun, it is called an *adjective*; if it express action, it is a *verb*; if it indicate the mode of action, it is an *adverb*; and so on. The same word is not always the same part of speech; e.g., 'Sunshine' is usually a noun, but in the verse, 'on a sunshine holiday,' it is an adjective. The essential P. of S. are the Noun (q. v.), Adjective (q. v.), Pronoun (q. v.), Verb (q. v.), Adverb (q. v.), Preposition (q. v.), and Conjunction (q. v.). Some grammarians add the Article, without good reason so far as modern English is concerned (see ARTICLE). The right of the Interjection (q. v.) to be considered a part of *speech* in any tongue is also challenged.

Part-Song, a choral composition resembling a glee but designed for a greater number of voices, and differing from a madrigal by the modern and simple style of its harmony, and the absence of contrapuntal treatment. The composition is usually in four parts—if it is written for mixed voices—soprano, contralto, tenor, and bass; or if for male voices alone, alto, two tenor parts, and bass (in Germany two tenor and two bass parts). The music is frequently repeated without variation in each verse of the song. Solos are occasionally introduced. The P.-S. is of German origin, and of late years has become very popular in England. In this style of composition Mendelssohn has never been surpassed.

Parturition. See MIDWIFERY.

Parvise' (Lat. *parvisum*) a church-porch, where lawyers could be seen, and specially that at Westminster. Readers of Chaucer will remember the

'Sergeant of lawe, war, and wys,
That often hadde ben atte *parryis*.'

Pascagoula, a river of Mississippi, U.S., is formed by the confluence of the Leaf and Chickasawha, flows through the S.E. part of the State, and enters the Mississippi Sound by a beautiful bay of the same name. It is navigated for about 100 miles by small steamers, and sends down much fine timber to New Orleans. P. is also the name of a city and port of entry on an inlet of the Mexican Gulf, 40 miles from New Orleans by rail, with a large lumbering trade, some shipbuilding, and a pop. (1870) of 480.

Pascal, Blaise, an illustrious French thinker, was born at Clermont-Ferrand, in Auvergne, 19th June 1623. His father was president of the Court of Aids in that town. P. lost his mother when he was three years of age. In 1631, delighted with the symptoms of intellectual eagerness exhibited by his only son, the elder P. brought his family to Paris with

the intention of devoting himself to their education. Being a scholarly man and a fine mathematician, he was admirably qualified for the task. The boy early manifested a keen spirit of inquiry, and was never content without knowing—his sister, Madame Périer, writes in her life of him—'la raison de toutes choses.' Nor would he be put off with ignorant answers; 'nothing save exact knowledge satisfied him.' Afraid that the study of mathematics would turn the current of P.'s attention from the study of languages, the father forbade him to read books on the subject. His curiosity was, of course, thoroughly aroused by the prohibition, and having been informed of the general scope of mathematical science, he secretly applied himself to solving its problems for his own satisfaction. By the time his father had become acquainted with his furtive pursuit he was, says Mme. Périer, through his own unaided reasoning, as far advanced as the thirty-second proposition of the first book of Euclid. Being then allowed every facility for prosecuting the study, he produced in his sixteenth year a *Traité des Coniques*, which Descartes perused with astonishment; and when he was eighteen he invented a calculating machine (*Machine arithmétique*), which, though useless in practice, proved the possession of an extraordinary inventiveness by its author. But the pressure of mental pursuits, too earnestly followed out, broke his health, which he never afterwards recovered. Physical torture was more or less his companion all through life. In 1647, the experiments of Toricelli having suggested to him natural philosophy as a fresh field, he published *L'Equilibre des Liqueurs et Pesanteur de l'Air*. These publications made an epoch in the history of physics. About the same time, however, a course of reading in the theological literature of the Jansenists began to awaken in him some doubts about the prosecution of science as an aim in life. Science to Jansen (q. v.) was merely one of the lusts of the flesh, and P. shortly saw it in that light also. The first fruits of his new devotion were seen in recommending his sister Jacqueline to the nunnery of Port-Royal. Though he continued to move in society, and, as the practical result of his secular studies, invented, among other things, a dray and an omnibus, it was not long before he abandoned the world, and retired for the rest of his life among the scholars of Port-Royal-des-Champs. On the 23d of January 1656 appeared the first of his *Lettres écrites par Louis de Montalte à un Provincial de ses Amis*. The circumstance which gave rise to the series was the attitude of the Jesuits towards the followers of Jansen within the Catholic Church. St. Cyran, the chief of the Port-Royalists, was pursued with relentless rigour by the Jesuits, because he endeavoured to reduce to practice the Augustinian doctrines of Jansen. Arnauld (q. v.) was disputing with the Pope, the king, the chancellors, the clergy, the Sorbonne, and the universities, on the same side. The *Lettres* appeared in the heat of the struggle, and brought the discussion within universal comprehension. Their publication was extended to March 24, 1657. They are eighteen in number, and deal with Arnauld's dispute, the morals of the Jesuits, the maxims of the casuist, and the question of grace. The quarrel is now antiquated, but P.'s volume remains a classic. 'The first work,' says Voltaire, 'of genius which appeared in prose was the collection of the Provincial Letters. Examples of every species of eloquence may there be found. There is not a single word in it which, after a hundred years, has undergone the change to which all living languages are subject. We may refer to this work the era when our language became fixed.' P.'s mode of life increased in austerity as he grew older. Every pleasure he renounced, and even the common tokens of fraternal love he ceased to offer to his sisters, convinced that all they had to bestow of affection should be given to God. He gave generously of his means to the poor, and stunted himself. Self-mortification he carried to such an extent as to wear an iron girdle, whose sharp prongs he forced into his side when he became conscious of humiliating thoughts. But during these sombre experiences he was slowly thinking out the *Pensées*, a set of meditations which French critics characterise as an apology for the Christian religion. It is rather a broken series of contemplations upon man, God, and destiny, in which faith and scepticism appear and disappear according to the special fervour under which they were penned. P. does not, however, disparage the human intellect like most apologists for faith, though in confronting it with the mystery of the universe he proves its essential littleness. It has been said that the *Pensées* were penned with his heart's blood. The saying

is true, for his thoughts are the revelation of an agony of spiritual research such as the world has but seldom witnessed. He was delivered from it all in his thirty-ninth year, having died at Paris, 19th August 1662. The *Œuvres Complètes* of P. were published by Bossuet (Par. 5 vols. 1779, and again in 6 vols. 1819), by De la Hure (Par. 2 vols. 1861). See Mme. Périer's *Vie de P.* (Par. 1715), Sainte-Beuve's *Port-Royal* (vols. ii., iii.), Cousin's *Des Pensées de P.* (Par. 1844), Prevost-Paradol's *Études sur les Moralistes Français* (Par. 1865), Havet's *Études sur P.* (new ed. 2 vols. 1867). An interesting sketch of P.'s life and work, by Principal Tulloch, forms one of Blackwood's series of *Foreign Classics for English Readers* (Edinb. 1878).

Pas'co. See CERRO DE PASCO.

Pas de Calais, a department in the N.W. of France, formed from parts of the old provinces of Artois and Picardy, is bounded on the N. and W. by the Straits from which it takes its name, on the S. by the Somme, and on the E. by Nord. Area 2550 sq. miles; pop. (1872) 761,158. It has a coast-line 80 miles in length, consisting alternately of sandy beach and lofty cliff. The country is flat, except where a range of low hills traverses it from S.E. to N.W., and is well watered, the chief rivers being the Authie, Canche, Scarpe, and Lys. The principal minerals obtained are coal, iron, lead, marble, and slate. The soil is exceedingly fertile, and, besides all the usual cereals, beet-root is extensively grown. Sugar, oil, beer, and tobacco are manufactured, and large quantities of cotton and linen goods are produced. The situation of the department opposite the British coast promotes a thriving commerce, which is carried on by means of a network of canals and railways. The capital is Arras, the largest town Boulogne; other places of importance are Calais, Bapaume, Béthune, St. Venant, St. Omer, and Montreuil.

Pasewalk, a town of Prussia, province of Pomerania, on the Ucker, 25 miles W.N.W. of Stettin by rail, has manufactures of spirits, tobacco, woollens, and leather, and a pop. (1875) of 8534.

Pash'a (Pers. *padishah*, from *pād*, 'protector,' and *shah*, 'ruler'), the title of Turkish governors of provinces, and of military and naval commanders of high rank. The badge of a P. is the tail of a horse or yak, borne on a staff, which is crowned with a gilt ball. The three grades of pashas are indicated by the number of the horse-tails on their standards. The highest officers civil and military are pashas of three tails.

Pashmī'na, the trade name for the shawl-wool of Turkestan and Central Asia, which is exported to a considerable extent by native traders, to be woven in the towns of Cashmere and the Punjab. In 1875-76 the registered imports into the Punjab were valued at £204,000, showing a decrease on the preceding year; and it is officially stated that the trade is declining, owing to the absence of demand in Europe.

Paskevitch, Ivan Fedorovitch, a Russian marshal, born May 19, 1782, at Poltava, was the son of an inferior Government official, became page to the Emperor Paul, and (1800) lieutenant in a regiment of the Guard. He distinguished himself at Austerlitz (1805), and afterwards in the war with Turkey, was appointed lieutenant-general after the battle of Leipsic (1813), and was at the siege in Paris in March 1814. In 1823 he became the Emperor's chief aide-de-camp. During the war with Persia in 1826-27 he took Erivan (for which he was surnamed 'Erivanski'), and forced the enemy to a peace highly favourable to Russia; in 1828-29 he fought with striking success against the Turks in Asia, took Erzeroum, and after the peace was made a field-marshal. On the death of Count Diebitch-Sabalkanskij (1831), P. received the supreme command against the Poles, took Warsaw, and repressed the revolution, for which he became 'Prince of Warsaw' and Vice-king of Poland. In this position he vigorously followed out the Emperor's system of compulsion, whose objects were to destroy the nationality of Poland, and make it a Russian province. In 1849 P. led the army that helped Austria against Hungary, and compelled Görgei to capitulate. In the Crimean War he had at first (1854) the chief command, but in consequence of a wound received at Silistria retired to Poland, where he died at Warsaw, February 1, 1856. See Tolstol, *Essai Biographique et Historique sur le Feld-marschal Prince de Varsovie* (Par. 1835). His son, Fedor P., distinguished himself in the Hungarian and Crimean Wars, became general aide-de-camp in 1856, and in 1861 a lieu-

tenant-general, but was cashiered in 1866 owing to the opposition he showed to the government as a member of the convention of the nobility at St. Petersburg in that year.

Paspalum is a large genus of grasses belonging to the tribe *Panicæ*, and chiefly natives of tropical and sub-tropical countries. *P. distichum*, ranging from India to S. E. Australia, yields a good fodder, and growing in large hassocks, is useful as a swamp grass. *P. scorbulatum*, widely dispersed in the tropics of the eastern hemisphere, is valuable in pastures, besides furnishing in India a grain crop similar to that procured from the allied genus *Panicum* (for which see MILLET). Of Central American species, *P. stoloniferum* and *P. dilatatum* are commended as fodder grasses, and *P. ciliatum* as a cereal. *P. purpureum* forms important pasturage in the arid coast districts of Peru. *P. exile* is the 'hungry rice' or Fundi (q. v.) of W. Africa.

Pasque Flower (Old Fr. *pasque*: Old Eng. *pasche*: Lat. and Gr. *pascha*, from the Heb. *pesach*, 'the passover'), is a pretty flower that takes its name from blossoming about Easter. Gerard (1599) terms it 'purple passeflower,' the words Pask, Passe, or Pase being all formerly applied to this festival of the Christian Church. Botanically it is called *Anemone Pulsatilla*, and is a native of Europe and N. Asia, occurring in Britain on chalk downs and in limestone pastures in several of the midland and eastern counties of England. After the solitary purple flowers are over, the peduncle lengthens, and the carpels bear a long feathery down, giving a handsome appearance to the head of fruit. Like other members of *Ranunculaceæ*, it contains an acrid essential oil, and though not included in modern materia medica, furnishes a medicine which is a favourite with homœopaths.

Pasquinades, political or personal lampoons, so called after a witty Roman cobbler of the 15th c., whose shop stood near the Palazzo Breschi. On its site was afterwards erected a mutilated group of ancient statuary, representing Menelaus with the body of Patroclus, which group was dubbed with the cobbler's name. To it the Roman populace was in the habit of affixing scurrilous queries or epigrams, the answers to which were placarded on the Marforio, the statue of a river-god, which formerly faced the Carcer Mamertinus, and is now in the Capitoline Museum. Collections of these P. were published at Rome in 1510, 1512, 1513, and 1526, and at Basel in 1544. See Mary-Lafon, *Pasquin et Marforio* (Par. 1861).

Passage, or **West Passage**, a seaport of Ireland, in Cork county, on the W. side of Cork harbour, 6 miles by rail from Cork, of which it is a marine suburb and watering-place. It has a quay, a dockyard, and several shipbuilding yards, and the larger vessels bound for Cork lie off here. Pop. (1871) 3652.—**East P.**, a seaport with some trade, is on the W. side of Waterford Harbour, 6 miles E. by S. of Waterford, and has a pop. (1871) of 729.

Passaglia, Carlo, a Roman Catholic theologian, born at Pieve a San-Paolo, in Tuscany, May 2, 1812, was educated at Lucca, and, after 1827, in the Jesuit College at Rome, where, having taken orders, he rose by his diligence and oratory to be professor, first of canon law, and afterwards of dogmatic theology. On the expulsion of the Jesuits from Italy (1848), he retired to England, but returning to Rome in 1851, was a year later appointed president of the Commission which decided the dogma of the Immaculate Conception. P.'s declaration in favour of the national movement of 1859 was followed by his secession from the Jesuit Order, and by his withdrawal to Turin, where he founded the anti-papal *Mediatore* (1862), and received the chair of moral philosophy, a post which he still (1878) retains. He represented Montecchio in the first Italian Parliament (1863), and has actively promoted the cause of 'Liberal' Catholicism in Italy. Among his writings are *Per la Causa Italiana di Vescovi Cattolici* (Flor. 1859), *Della Scomunica* (Flor. 1861), an answer to Renan's *Vie de Jésus* (2 vols. Tur. 1864), &c.

Passaic, a river of New Jersey which flows into Newark Bay 3 miles from Newark, after a tortuous south-easterly course of about 100 miles. It is navigable for 13 miles from its mouth, and at Paterson it has a fall of 72 feet, supplying an immense water power, which is utilised by several factories.

Passamaquoddy Bay, between the province of New Brunswick, Canada, and the State of Maine, is about 15 miles

long, with an average breadth of 10 miles. Its shores are very irregular, and abound in good harbours. The bay, which contains numerous islands, receives several rivers, of which the St. Croix is the most important. The tide rises here 25 feet.

Passant (Fr. 'walking'), in Heraldry, describes the attitude of any animal when walking. The Lion P. has three paws on the ground, while the fourth (the dexter forepaw) is raised, and the tail is curled over the back. See LEOPARD, THE.

Passarowitz, or **Poharewätz**, a town of Servia, near the Austrian frontier, 7 miles S. of the Danube, and N.E. of the Morava, notable as the place where the treaty of 1718 was signed by Prince Eugene and the Grand Vizier, ending the war between the Turks and Venetians, and securing to Austria the Banat of Temesvar, the W. part of Wallachia, a part of Bosnia, and the town and territory of Belgrade.

Passau, a fortified town of Bavaria, at the confluence of the Inn and Ilz with the Danube, 105 miles E.N.E. of Munich by rail. It is a picturesquely-situated and finely-built town, on a rocky neck of land between the Inn, here 863 feet wide, and the Danube, 719 feet, and has an imposing appearance, rising like an amphitheatre from the Inn. It consists of Altstadt, Innstadt, Illstadt, and Neumarkt with Anger, and is protected by the fortress of the Oberhaus (built 1219), on a rock 426 feet high, and connected with the Unterhaus, and by 10 detached forts. The most interesting buildings are the Cathedral (founded 1284, and restored after a fire 1662-80), and the Post-Office, where the Treaty of P., which first established religious toleration, was signed by the Emperor Karl V. and Moritz of Saxony, 31st July 1552. P. has a gymnasium, an industrial school, and a Jesuit College, and is the seat of a bishop and of a court of appeal. The manufactures are various and important, including leather, tobacco, porcelain, earthenware, and beer; and there is some shipbuilding for the river trade. Pop., almost exclusively Roman Catholic (1875) 14,757. P. occupies the site of the Roman *Castra Batavia* (a name corrupted first into *Palatinum*, and finally into P.), and was formerly the capital of a bishopric founded in 739, secularised in 1803, and wholly incorporated with Bavaria in 1805. See Erhard, *Geschichte der Stadt P.* (2 vols. Passau, 1862-64).

Passenger Pigeon (*Ectopistes migratorius*), a species of *Columbide*, or pigeon, belonging to N. America, and noted for its habit of migrating from one part of the continent to another in flocks numbering many thousand birds. It attains a size equal to that of the common pigeon. Its colour above is a general slate blue, exquisitely varied by a metallic lustre and green gloss. The abdomen is white, and the lower part of the breast pale red. The tail is long and pointed, its two central feathers black, and the remaining ones white. The beak is black. The average length of the P. P. is 16 inches, the female bird being smaller than the male. Its food consists chiefly of beech-mast, but it also feeds on rice and other grains, on berries, and similar substances. Its grain-eating propensity is a serious matter for the American farmer. Wilson calculated that a flock observed by him extended for 240 miles, and included at least 2,230,272,000 birds. The daily food-supply of this enormous multitude he estimated at 17,424,000 bushels of grain. Audubon calculated that 8,712,000 bushels of grain would be required daily to feed a flock numbering 1,115,000,000 birds. The P. P. flies with great rapidity, and birds with undigested rice in their crops—rice obtained from Georgia and Carolina rice-fields—have been killed near New York. This fact seems to prove that the P. P. can fly a distance of from 300 to 400 miles in about six hours. Some specimens have been killed in Britain; one in Fife, in 1825. The young are hatched in about sixteen days, and the female lays two eggs of a white colour. Both sexes perform the work of incubation.

Passengers by Land or Sea. Power to inspect railways and to control their construction is under statutes vested in the Board of Trade; before whom copies of the bye-laws of every company must be laid, otherwise they are void; and the Board of Trade may disallow any proposed bye-law. Every railway and canal company is required to make arrangements for receiving and forwarding P. and goods without unreasonable delay, and without partiality or preference. The general rule of law that masters are responsible for the acts of their servants

done in their official capacity holds good with regard to railway companies and coach proprietors and their servants; hence, any passenger injured in travelling by public conveyance, by fault of the carrier, has a just claim for compensation against the owner; and if any one be so killed, the right of claim falls to his or her wife, or husband, or children. The legal presumption in the case of injury or death to a passenger is always in favour of fault on the part of the carrier. Railways are bound to afford reasonable accommodation to the public; but they are not bound to accommodate extraordinary numbers. There are various statutes which regulate the duties of carriers by sea towards their P. Diet must be wholesome and sufficient. See under CARRIERS—Carriers, Wharfingers, and Warehousemen.

Passeres, Passerine Birds. See INSESSORES.

Passing Bell is a bell tolled in Catholic countries during the solemn moments when the spirit is 'passing' from the body, with the intention of inviting those that hear it to join in the prayers ordered for the dying.

Passing-Notes (in Music). Notes not essential to harmony, used in passing from one essential note to another.

Passion Flower, or technically *Passiflora*, is the type genus of *Passifloraceæ*, a natural order of dicotyledons, chiefly natives of tropical America, and in addition to the above includes such genera as *Paroplia*, *Smacanthamnium*, *Tasconia*, and *Malesherbia*. The beautiful plants united under P. F. number about 200 described species, consisting for the most part of climbing herbs or shrubs provided with tendrils, but a few are small erect trees, without the tendrils. Their curious flowers have given rise to considerable botanical discussion, and authorities are still at variance as to the true nature of the different parts. Many of the species have edible fruits known under the names Granadilla (q. v.), those for *P. quadrangularis*, *P. alata*, &c.; water lemon of the W. Indies (*P. laurifolia*); conch apple or sweet calabash (*P. maliformis*). The part eaten is the fleshy aril attached to the seeds, or the juicy pulp in which they are embedded—the taste varying from a pleasant to a mawkish flavour. Occasionally, as the produce of home culture, the fruits of the better descriptions are seen in the European markets. Of *P. macrocarpa*, fruit weighing 8 lbs. have been grown in Australia. Medicinal properties are ascribed to several species; e.g., the root of *P. quadrangulum* is narcotic; that of *P. contrayerva* and *P. normalis* are reported to be poison antidotes; from *P. rubra* a tincture is obtained called Dutchman's laudanum; the leaves of *P. fatida* are employed as poultices, and those of *P. laurifolia* as anthelmintics. Of the numerous species, varieties, and hybrids cultivated for ornamental purposes, *P. ærulea* is the most hardy. The name P. F. was given from the points of fancied analogy presented by the plant to the memorable events at Calvary; thus the three stigmas represent the three nails, the five archers the five wounds, the filamentous processes of the corona the crown of thorns, &c.

Passionists is a name given to the priests of the Order of the Holy Cross and the Passion of Christ, or *Congregatio Clericorum exalceatorum S.S. Crucis et Passionis*, which was founded by Paolo Francisco de Danel, born at Ovado in Sardinia, 3d January 1694. Paolo assumed the name 'della Croce' in 1720, occupied a cell on Mount Argentaro at Rome, and received from Pope Benedict XIII. the privilege of founding an order of missionaries, with the object of preaching the love of Christ as displayed in his Passion. He and his brother Giovanni were ordained priests in 1727. Paolo died on the very day (18th October 1775) on which he received a bull from Pope Pius VI. establishing the order, was beatified in 1852, and canonised in 1867. In 1762 P. were employed as missionaries to Bulgaria and Wallachia, and subsequently missions of the order have been sent with more or less success, to other countries, Belgium, Great

Britain and Ireland, Australia, &c. See *Abregé de la Vie du B. Paul de la Croix* (Tournai, 1857), and *Father Pius' Life of S. Paul of the Cross* (Dubl. 1867).

Passion Music is music illustrative of the Passion of Our Lord as narrated in the Gospels. In the Roman Catholic Church from an early period it was usual to assign the recital of the Gospel of the Passion during Holy Week to a number of different priests who intoned the words of Jesus, Pilate, the High Priest, &c., and the words of the people (turbæ) to the congregation or choir. From this custom the Passion-plays, so popular during the Middle Ages, and the German P. M., seem alike to have sprung. After the Reformation, original compositions were introduced into the P. M. of the Lutheran Church instead of the traditional church tones, and such pieces of music were made suitable for performances at other times and places than at particular services in the church. The oldest known version of P. M., printed at Wittenberg in 1573, with recitatives and four-part choruses, has been attributed to Antonio Scandell. Heinrich Schütz was the inventor of the feature of a reflective chorus, and Johann Sebastian (about 1672) introduced orchestral instead of organ accompaniments. At the beginning of the 18th c. Keiser utilised original libretti instead of the Gospel narratives for his P. M., *Der Blutige und Sterbende Jesus*, &c., and adopted the 'soliloquia,' a frequent reflective and recitative passage, in which he was followed by Telemann, Handel, and Johann Sebastian Bach. The last-named great master in his two works on the Passion according to St. Matthew and St. John, the most sublime compositions of this kind, made effectual use of the chorale; and selecting simple hymn tunes as his basis, which he grandly harmonised, pressed into his service the voices of the entire congregation. The harmony of the small choir was enforced with the accompaniment of organ and orchestra. It is not customary now, however, in Germany, for the congregation to take any part in the music; and, in the London performances of Bach's works, the singing of the chorales by the choirs, without any instrumental accompaniment, has been found admirable and effective.

Passion Plays, religious dramas, representing the Passion of Christ, were probably developments of the Good Friday processions, and date from an early period. The earliest that has come down to us, *Ludus Paschalis sive de Passione Domini* (printed in Schmeller's *Carmina Burana*, Stuttg. 1847), belongs to the 12th c., and is half Latin, half German. The first wholly German passion play, composed in the 13th c., is only preserved in fragments, as also is the *Marien-Klage*, but we have numerous perfect specimens, dating from the 14th and 15th centuries in Mone's *Schauspiele des Mittelalters* (Karls. 1846). These plays lasted occasionally through seven days, and employed between two and three hundred performers. Their popularity waned at the Reformation, but they still survive in Spain and Southern Germany, the most famous passion play of modern times being that of Ober-Ammergau (q. v.). See MYSTERIES.

Passion Week is the week before Easter (q. v.), so called because in it took place the Passion and death of Christ. In the early Church it was called the Great Week, and was distinguished, even above the rest of Lent (q. v.), by greater rigour of fasting, greater almsgiving, by rest and liberty granted to slaves, a release of all prisoners, and the closing of the law-courts. On the Thursday, the day on which our Lord instituted the Supper, and was betrayed, the communion was administered in some churches in the evening after supper. (For other customs observed at a later period see **MAUNDY THURSDAY**.) On the Friday, absolution was granted to all who observed the day with fasting, prayer, and true contrition, including public penitents whose term of penance was completed. The Saturday, or Great Sabbath of the Jews, was the one Sabbath throughout the year which the Greek churches, and some of the Western, observed as a fast.
